This showed that very serious reprecipitation takes place under these extreme conditions involving destruction of all free cyanide present, but a similar test with 0.25 per cent. solution showed practically no reprecipitation after 66-hours' contact, when the residual free cyanide strength was 0.21 per cent. The possibility, however, of reprecipitation under certain conditions may partly serve to explain why such short and imperfect settlement in decantation slime treatment is practiced in Mexico, if experience there has shown that prolonged and undisturbed contact between slimes and solution results at times in higher residual values through reprecipitation. Tests of a week's contact of ore submerged in cyanide solution and only shaken once daily gave poor results, so that favorable conditions rather than prolonged treatment seem to be the essential requisite. In general, there would appear to exist the opposing influences of solution, aided by the aëration

due to agitation; and of precipitation of dissolved gold and silver favored by absence of oxygen and destruction of free cyanide. A similar condition has been noted in regard to gold precipitated on zinc shavings in contact with cyanide solution.¹ The practical conclusion appears to be that separation of solution from solids should be prompt after the gold and silver is dissolved.

Blakney Hydraulic Air Compressor

Blakney's hydraulic air compressor has been designed to furnish a cheap means of compressing air at mines at which a high head of water is available. It works on the principle of hydraulic compression that has been used in several large installations, but, while the others are in use where there is a moderate head and a shaft is sunk to get the necessary pressure for compression, this machine is de-

BLAKNEY AIR COMPRESSOR

signed to be connected to the pressure pipe, using part of the head to obtain the compression. The degree of compression is regulated by a weighted valve. The escaping water can be used for running an impulse wheel for driving other machinery.

According to the inventor's experiments with a head of 184 ft., the water will furnish by means of this machine 1 h.p. in compressed air at 100 lb. per sq. in. for each square inch of cross-section in the feed pipe. This device is the invention of R. I. Blakney, 4123 Fremont avenue, Seattle, Wash. As yet none of these compressors is in operation.

Notes on Cyanidation*

By LEO D. BISHOP†

Most ores that are amenable to the cyanide process contain both free and latent acids; these destroy cyanide. Consequently, a protective alkalinity must be maintained to prevent the consumption of cyanide. Alkalies must also be used for the purpose of hastening the filtration of solutions, especially where there is any appreciable amount of slime or finely ground ore.

For the purpose of settling slime it is not necessary that an alkali or hydroxide be used. More effective settlement can be had by the use of distilled water than by the use of either acid solution or hydroxides. Sodium hydroxide produces a coagulation of the slime and a rapid and compact settlement, but leaves a poorer clarification than lime. However, when properly slacked lime is added to the slime, a flocculent effect is obtained and the slime coagulates into a flaky curd that does not settle out so compactly by gravity, but does leave a clearer and more brilliant solution than either sodium hydroxides or acids give.

It is not necessary for the purpose of settlement that the slime be coagulated. In fact, it is oftentimes injurious to add lime for that purpose. It is necessary, however, that lime be used and the slime coagulated for the purpose of rapid and clean filtration. In fact it is almost an absolute condition precedent that every particle of slime be completely coagulated in order to get the most rapid filtration and a clear solution suitable for good precipitation.

EXPERIMENTS TO DETERMINE THE EFFECT OF TEMPERATURE AND EXCESS OF ALKALI UPON SETTLING

For the purpose of illustrating the factors governing the coagulation of slime by means of lime, I have carried out some experiments using varying degrees of heat in filtration and varying amounts of lime excess. I have also made some further experiments in the care and slacking of lime, which I shall take up later. For the purpose of these experiments, I took a sample of ore furnished by the Creston Colorado company of Minas Prietas, Sonora, Mexico, which was completely oxidized and silicious in character, containing a high percentage of original slime. This ore was ground in a tube mill until it all passed a 200-mesh screen.

The following experiments were made on pulp containing 2 of solution to 1 of ore by weight: The first sample of slime was allowed to settle one hour

when 18 per cent. of partly clear solution was obtained at a temperature of 70 deg. F. Only the natural salts of the ore were in this solution, which was acid in reaction. To the second sample of slime a solution of properly slacked lime was added making 2 of solution and 1 of ore by weight, with the solution carrying $1\frac{1}{2}$ lb. excess lime per ton. After thorough mixing, the sample settled and gave 10 per cent. clear solution in one hour. This is only a little more than half the amount that water gave.

In the next series of tests the purpose was to find out what effect varying degrees of heat would have on the settlement of slime. In these the same Creston Colorado slime was used with a pulp consistency of 2 of solution to 1 of ore in weight. The excess of lime in each case was $\frac{1}{2}$ lb. per ton of solution.

HENDRYX AGITATOR-FILTER USED IN TESTS

In the first sample 18 per cent. of the volume had settled clear in one hour at a temperature of 70 deg. F.; in the second, 24 per cent. of the volume had settled completely in one hour with a temperature at 90 deg. F., and in the third with the temperature at 120 deg. F., 30 per cent. had cleared up in one hour.

Conclusive experiments from freezing to boiling points have not been carried out, but I would expect little, if any, settling at freezing point, and the maximum settling of the slime as the boiling point was approached.

In the next series of experiments to determine the effect of a large excess of lime on settling, the same character of ore was used with all the conditions the same as in the preceding series, except that the excess of lime was raised from $\frac{1}{2}$ to $1\frac{1}{2}$ lb. per ton of solution.

The first sample settled only 10 per cent. of its volume in one hour with the

temperature at 70 deg. F.; the second sample settled 12 per cent. of the total volume at 90 deg. F. in one hour, and the third sample 18 per cent. of the volume at 120 deg. F. in one hour.

These experiments indicate that a large excess of lime hinders the settling of the slime, while an increase of temperature greatly aids settlement.

The next series of tests was made to see what effect heat would have on the filtration of slime, using a filter cell of the Hendryx type. This cell is composed of an open frame, with a canvas covering and a layer of cocoa matting between the two canvas sides. Vacuum was not used in these tests, gravity alone sufficing.

In the three tests, the excess lime was $\frac{1}{2}$ lb. per ton of solution and the pulp was 2 of solution to 1 of ore by weight. The amount of pulp used in each test was the same, with all conditions identical except a variation in temperature. At 70 deg. F. the solution filtered at the rate of $8\frac{1}{4}$ lb. of solution per hour per square foot of canvas per hour. At 90 deg. F., or a raise of 20 deg., the rate was more than doubled, the flow of solution reaching 18 lb. per square foot of canvas per hour, and at 110 deg. F. filtration was made at the rate of $24\frac{3}{4}$ lb. per hour per square foot of canvas. In other words, with the temperature increased 40 deg., the rate of filtration was increased just three times.

PROPER ALKALINITY, CHOICE AND CARE OF LIME

In the next part of this paper I shall deal with the selection of the proper alkalinity, the choice of lime and the necessary care in the handling and use of lime.

The question as to the most economical and satisfactory neutralizer must depend almost entirely on the ore which is being treated. Only by making comparative tests as to the percentage of extraction, the consumption of cyanide and the cost per ton of ore for neutralization can this be determined intelligently. Moreover, the effectiveness of precipitation is also too often influenced by the character and quantity of lime used.

Some ores show an appreciable advantage in extraction, by using sodium hydroxide in conjunction with lime, thereby obtaining an increased extraction and a less consumption of cyanide. A sample of ore from Black Hawk, Colo., gave an extraction of 71.0 per cent., with a loss of 4.1 lb. cyanide per ton. using both lime and sodium hydroxide as neutralizers. Where lime alone was used, the extraction was lowered to 59.7 per cent., and the consumption of cyanide increased to 6 lb. per ton of ore. In this case, the use of 1.5 lb. sodium hydroxide per ton of ore raised the extraction 12 per cent. and lowered the loss of cyanide 1.9 lb. per ton of ore.

*Abstract of paper read before Colo. Selent. Soc., Nov. 7, 1908.

†Metallurgist with Hendryx Cyanide Machinery Company, Denver, Colo.

In the choice of lime and the necessary care in its handling and use there seems to be an almost utter disregard. Rarely any thought is given to the choice of the lime. Many operators class all lime as good lime and let it go at that. In one mill that I have in mind, where a large tonnage of ore was treated it was discovered that fully 33 per cent. of the consumption of cyanide was due to the impurities and cyanicides in the burned lime itself.

The cost of treating ore by the cyanide process is increased probably more by the unintelligent handling and use of lime than by any other item. Many operators today allow their lime to become partially air slacked before using it. After standing exposed to moisture and air, it is then fed in with the ore and drowned with an excess of cold solution.

For purpose of illustration I have taken a Missouri lime, thoroughly calcined. The first sample of this lime was exposed to the air until it became partially air slacked. Then 0.25 lb. was boiled with 1 lb. of water for five minutes; after that the soluble calcium hydroxide was washed out by decantation with a large excess of cold water. The residue after drying amounted to 12.5 per cent.

Another sample of 0.25 lb. of the same partially air-slacked lime with 10 lb. of water at 65 deg. F. was allowed to stand for three days with occasional stirring. The soluble calcium hydroxide was then washed out with an excess of cold water. After drying, the residue amounted to 35 per cent. of the original amount.

The conclusion arrived at from these two tests shows that fully 35 per cent. of the weight of the lime is lost by allowing it to become partially air slacked and then attempting to slack the balance by means of a large excess of cold water.

For the purpose of comparison the next tests were made on lump lime ground to pass a $\frac{1}{8}$ -in. hole. In the first case 0.25 lb. of lime was placed in 20 lb. of water at 65 deg. F. and allowed to stand for three days with occasional stirring. The soluble hydrate was then removed with an excess of cold water and the residue dried. This residue amounted to 25 per cent. of the whole amount.

In the second case 0.25 lb. of crushed lump lime was mixed with 1 lb. of water. In four minutes the whole mass had reached the boiling point, due to chemical action, and had become almost thoroughly converted from the oxide to the hydrate. There were no lumps or grains left unslacked. The chemical action was practically complete, and a rich, thick paste was the result.

Settlement and filtration tests were then made on the limewater taken from the partially air-slacked lime, the cold-water slacked, and the hot-water slacked. The pulp in each case was 3 of solution to 1 of ore, and the temperature was 70 deg.

F. The partially air-slacked lime caused the slime to settle 115 c.c. in a 500-c.c. cylinder, or 23 per cent. in one-half hour. The same solution filtered at the rate of 22 lb. of solution per square foot of canvas per hour in a Hendryx filter by means of gravity.

The cold, water-slacked lime produced a settlement of the slime of 190 c.c. in a 500-c.c. cylinder, or 38 per cent. in one-half hour and a filtration of 23.3 lb. of solution per square foot of canvas per hour in a Hendryx filter by means of gravity.

The hot, water-slacked lime caused the slime to settle 215 c.c. in a 500-c.c. cylinder, or 43 per cent. of the whole volume in one-half hour and filtered at the rate of 23.75 lb. of solution per square foot of canvas per hour. The properly treated lime caused the solids to settle almost double the amount that the air-slacked does, and also to filter somewhat faster.

From the foregoing results the question of the proper coagulation of the slime by means of calcium hydroxide is very important when we come to either the settlement or filtration of ores. Moreover, the application of heat is beyond a doubt economical and beneficial.

THE EFFECT OF HEAT AND MOTION ON THE SOLUTION OF GOLD

In the second part of this paper, I shall take up the effect of heat and motion on the dissolution of gold from ores. Quite a complete line of experiments was carried out by T. H. Plunkett, of Toronto, Canada, on the rate of dissolution of particles of gold ranging from 70 to 800 mg. in weight, by means of percolation, agitation, and agitation and heat. A particle of gold weighing 70 mg. was dissolved completely in 72 hours by percolation. A particle of the same size was dissolved in 16 hours by agitation and another of similar size in 10 hours by means of agitation and heat. However, such sized particles of gold would not reach the cyanide tanks in practice, but would be caught by amalgamation at the start.

It has been a common belief among cyanide men that the richer the ore, the longer the time of treatment necessary. Perhaps this is true in the usual methods of percolation, but if the pulp is thoroughly agitated, it is not necessarily true, as the following tests show:

A sample of white quartz with all the gold free that assayed \$2500 gold per ton, was pulverized to 200 mesh, and the coarse gold removed by amalgamation. The tailings after amalgamation assayed \$725 per ton. With an excess cyanide strength of 0.75 lb. per ton of solution and constant and thorough agitation for a period of only nine hours, the tailings were reduced to \$1.60 per ton. These results are not difficult to explain when we consider the fact that all the particles of gold remaining after amalgamation

were exceedingly small and not any larger than if the ore had assayed only \$25 instead of \$725 per ton; the cyanide solution was dissolving each and every particle of fine gold during the period of nine hours.

Another advantage of quick treatment is clearly shown in a test made on some 20-mesh tailings from the Ajax mine in New Mexico. These tailings contained a small percentage of iron sulphides. When this ore went into the leaching tanks it assayed approximately \$28 gold per ton. After being percolated for six weeks only \$1 per ton of ore was recovered. A sample of tailings from the top of the tanks was taken which went \$18.40 per ton. Without regrinding, this sample was agitated in a Hendryx agitator for a period of eight hours. The tailings then went \$9.60, representing a saving of 47.8 per cent. of the value of the tailings after six-weeks leaching. Another sample was then reground to 150 mesh and readily yielded 93.4 per cent. after an agitation lasting four hours.

The fact that the gold had not been recovered by percolation was accounted for by several different reasons, until an examination and an assay of each foot of tailings in the leaching tanks had been made. It was then discovered that the gold had re-precipitated. The assays showed an increase of value ranging from the top of the tank to the bottom.

Moreover, quick treatment by means of agitation effects a considerable saving in cyanide consumption, especially where there is a considerable amount of sulphides. A lot of ore furnished by the Star of the East Gold Mining Company, consisting chiefly of iron sulphides gave an almost complete extraction at 100 mesh in six hours by means of agitation and heat (90 deg. F.), with a loss of 1.35 lb. cyanide per ton of ore. This same ore yields a somewhat less extraction when percolated for six days, and the consumption of cyanide ranged from 0.50 to 0.75 lb. for each succeeding day after the first. The continual decomposition of the sulphides will and does produce a loss of chemicals, varying with the time of treatment.

EFFECT OF VISCOSITY ON SETTLING

In discussing Mr. Bishop's paper, Charles W. Comstock said that the increased rapidity of settling at the higher temperatures might be explained by the decrease in viscosity of the water with increase of temperature. If this is the true cause, the observed volumes of clear solution in Mr. Bishop's experiments should be nearly inversely as the coefficients of viscosity at the temperatures of the observations. The coefficients of viscosity deduced from the experiments of Poiseuille, and expressed in dynes per square centimeter, are given in the following table:

TABLE I.

Temp. in Deg. Centigrade.	Coefficient of Viscosity, N.
0.....	0.01723
10.....	0.01268
20.....	0.00978
32.....	0.00745
50.....	0.00532
70.....	0.00388

Mr. Bishop's experiments were made at temperatures of 70 deg., 90 deg. and 120 deg. F. I have used 20 deg., 32 deg. and 50 deg. C. as nearly equivalent, and have tabulated below the results of his observations together with the reciprocals of the coefficients of viscosity, giving also the relative values with the results at 20 deg. C. as unity:

TABLE II.

Temperature, Degrees Centi- grade.	PERCENTAGE OF CLEAR SOLUTION.					
	1 N		PERCENTAGE OF CLEAR SOLUTION.			
			0.50 Lb. Excess Lime.		1.50 Lb. Excess Lime.	
	Actual.	Relative.	Actual.	Relative.	Actual.	Relative.
20	102.2	1.000	18	1.000	10	1.000
32	133.7	1.308	24	1.333	12	1.200
50	188.0	1.840	30	1.667	18	1.800

It will be noticed that the agreement between the reciprocals of the coefficients of viscosity and the observed speeds of settling is sufficiently close to justify the inference that the whole effect of the increase in temperature is the decrease in viscosity. There are, of course, some irregularities which call for explanation. It is known that, other conditions remaining the same, the solution of certain salts, notably potassium sulphocyanate and potassium chloride, decreases the viscosity of the solution below that of pure water, while the solution of salts of other metals (excepting only rubidium and cesium, which do not occur in sufficient quantities to be worthy of consideration in this connection) increases the viscosity of the solution. A change in the temperature may change the relative amounts of potassium and other salts in the solution and thus produce an increase or a decrease in viscosity which must be superposed on the change due directly to temperature. This would appear to be a sufficient explanation of the irregularities in Table II.

Antimony Mines of Italy

Antimony ores are found in many parts of Italy, in addition to the better known locality at Limina, near Messina, in Sicily. There are important mines in Tuscany, where the Cettine di Cotorniano operates in a massive deposit of stibnite in Triassic dolomite; the Pietratonda and Casale di Pare mines at Campagnatico find the stibnite mixed with a chalcadonic gangue extending through Eocene limestones.

Each of these three Tuscan mines has its smelter. The one at the Pietratonda mine consists of four furnaces for mak-

ing oxide, and two reverberatory furnaces for reducing the oxide to metal. This plant went into operation in 1906 and is capable of yielding 2000 tons of antimony per year. The ore is easy to treat, since it contains nothing but stibnite and quartz.

At Casale di Pare, the silicious gangue rock is fissured, so that subterranean water has altered the stibnite into oxides and oxysulphides, with stibnite remaining intact only in the denser zones. The smeltery at this mine has three oxide furnaces, with reverberatories for reducing to metal.

According to *l'Echo des Mines* the old process of burning the ore and liquating

been restored to its former buoyancy, they anticipate a fair demand during the current year. The prices realized by the company are on an average lower than heretofore, a result not entirely due to lower markets, but partly to a slight deterioration in the quality of the finds. The company states that it will not attempt any more than it has in the past, to increase sales by lowering prices, but to maintain a policy of working on a scale commensurate with the size and capacity of the mine. At the general meeting of the company, held in February, no secret was made of the determination of the directors to fight De Beers.

By diamond buyers the news that the monopoly has broken down will be welcomed, although those with stocks on hand cannot fail to be alarmed at the possibility of a heavy fall in the price of the stones, which the uncontrolled production may bring about.

The Sanders Flotation Process

In U. S. Patent 911,077, Feb. 2, 1909, Walter M. Sanders describes an apparatus for his flotation process. It consists of a tank, preferably of cylindrical form, with a feed hopper leading below the normal

The Engineering & Mining Journal, N. Y.

SANDERS FLOTATION APPARATUS

the stibnite was not found satisfactory with these Tuscan ores, which carry only about 12 per cent. of antimony, but the present method, which consists of smelting the ore with coke in a furnace with abundant air blast and settling the oxides in a series of chambers, works satisfactorily. The difficulty at Casale di Pare is the presence of the oxides, which are fusible at only high temperatures, requiring special means to insure the necessary amount of air blast.

In Sardinia there is a mine at Carcinargius, now connected with the port of Corallo by a new 5-km. road, and another mine operating its own furnaces at Suergiu.

The Premier Diamond Mine

SPECIAL CORRESPONDENCE

The production of the Premier Diamond mine in the Transvaal for the year ended Oct. 31, 1908, amounted to 2,078,825 carats, an increase of 188,838 carats over the previous year. The number of loads of dirt washed was 8,058,844. The yield per load was 0.258 carat. The value of the diamonds recovered was £1,536,719, equal to a value per carat of 14s. 9d., and a value per load of 3s. 9d. The cost of production per load washed was 1s. 10d.

The directors report the termination of the contract with the Diamond Syndicate, which disposes of the De Beers output, and the opening of offices in London for the sale of the Premier stones. The sales have so far been satisfactory, and the directors say that they look upon the future of the trade as reassuring and that, while the market has not as yet

liquid surface. A solution inlet pipe is placed either in the tank or in the hopper, depending on the ore to be treated. A vertical shaft in the center of the tank rotates an agitator, the blades of which are arranged to impart a whirling motion to the solution. This whirling motion is designed to assist in raising the valuable mineral particles to the center of the tank and to cause a slight cavitation at the center of the surface, which causes the particles which have been elevated to pass at once to the overflow pipe. The tailings are discharged through a pipe in the center of the tank's bottom. A steam pipe is used on the bottom of the tank to keep the solution at an even temperature.

The Electric Smelting Company will install at Ludvika, Sweden, two furnaces for smelting iron by electricity and two for making steel, of the type designed by Dr. Eugene Haanel, of the Mines Department, of Canada.

The Coal-mining Industry of Montana

A Review of Each Property with Scale of Day Wages and Schedule of Mining Rates. Each Pound of Powder Produced 2.81 Tons of Coal

B Y J. P. R O W E *

The coal industry of Montana for the year just past has been important from several standpoints. During 1908 the United States Geological Survey has had several parties in the field in eastern and northern Montana working in the purely lignite beds of these sections of the State. Several new mines have been opened, including the new West Side or Sunset mine at Red Lodge; the Chicago, Milwaukee

tion of coal, with Cascade a close second.

In discussing the coal industry in this paper the counties will be taken in alphabetical order, and also the same order for the companies operating in each county.

CARBON COUNTY

The Barrett Brothers mine, located near Joliet, with Thomas Barrett, manager, operated 108 days with three pick miners,

to local trade and employees 520 tons; also using at the mine 1814 tons. This property is fast pushing the development work, and during the past year installed a 150-kilowatt electric generator and one 8-ton motor for haulage. The company is now working two seams, Nos. 2 and 3. No. 2 seam developed the first serious fire, by spontaneous combustion, in the Bear Creek field. All of the Bear Creek mines

INTERIOR OF LIGNITE MINE AT MILES CITY

COAL OUTCROP ON YELLOWSTONE RIVER

TIPPEL AND MINE OPENING NEAR HAVRE, MONTANA

COKE AND COKE OVENS AT ELECTRIC, MONTANA

and Puget Sound property, or Republic Coal Company, at Roundup, was greatly improved and developed; the Amalgamated plant, at Belt, closed their coke ovens; the Amalgamated property at Storrs, was practically idle during the entire year. In the realm of labor an agreement was entered into between the mine owners and unions until October, 1910. Carbon county is now the leading county in the State in the produc-

tion of coal, and produced for shipment 471 tons of coal, and sold to local trade and employees 502 tons. This mine has good promise, but during the past year nothing but development work was done. The Bear Creek Coal Company, located at Bear Creek, and managed by H. S. Hopka, worked 177 days; employing 72 pick miners, 7 inside and 15 outside day-hands, 1 machineman, 34 unloaders, producing for shipment 71,099 tons of coal, and sold

are dry, and a fire by spontaneous combustion is feared at many of the other properties. The fire in the Bear Creek mine is still alive but is not doing much damage. The coal is being undermined by means of mining machines, of the electric-cutting bar type, and consequently much dust is produced.

The Bituminous Coal and Coke Company's operation is located at Coalville, and is managed by Willis Todd. During

the past year 60 pick miners, 28 inside and 24 outside day-hands were employed, working 209 days and producing for shipment 21,689 tons of coal. This property is driving a double-entry system and recently installed an electric fan which has proved unsatisfactory. The mine will soon be lighted by electric lights and other important improvements will be installed within the next 12 months.

The Bridger Coal and Improvement Company, of Bridger, is managed by George Hough, and is one of the oldest mines in Carbon county. This mine was worked 200 days during the past year, employing 40 pick miners, 20 inside and 20 outside day-men, and produced for shipment 25,425 tons of coal, and sold to local trade and employees 2203 tons, besides using 5334 tons at the mine. This plant outside was practically rebuilt, new machinery was installed and work was commenced in sinking a new slope. This mine and the Spring Creek Coal Company, at Lewistown, are the only mines in the

mine was installed, and bunkers large enough to handle all of their production were built.

The Montana Coal and Iron Company's plant is situated at Bear Creek, and is managed by W. W. Worthington. The company employs 16 pick miners, 5 inside and 4 outside day-men, and produced, during 1908, 21,810 tons of coal for shipment, and sold to local trade and employees 144 tons. This company installed a box-car loader, an electric fan for ventilating purposes, and made several interior changes during the past year. The mine is in good condition and the company is making preparations for a large output for the coming year.

The Northwest Improvement Company, of Red Lodge, the largest producer in the State, is now operating two properties at Red Lodge, which are managed by C. C. Anderson. The West Side, or Sunset mine, is the new property, and the main entry or slope is driven in the No. 1½ seam. As yet no great amount of coal is

cent. of all of the men employed in the coal-mining industry of Montana. The number of days this mine was worked last year was 273.

The West Side, or Sunset mine worked 166 days, with 60 pick miners, 40 inside and 51 outside day-men, 1 machine-man, and produced for shipment 32,343 tons of coal, besides 11,900 tons which were sold to local trade and used at the mine.

Under former management the old mine at Red Lodge was mined with the sole purpose of showing a big output, regardless of the amount of coal left remaining in the territory mined; therefore, most of the large coal pillars were allowed to remain untouched. The present management is now pulling these pillars, especially in the fifth east, and it is quite dangerous work. No. 4 slope has been driven by the present management to the seventh level east and fifth level west. Entries have been driven and rooms turned off of these contribute a considerable portion of

TIPPLE AND NEW SPIRAL SEPARATORS, RED LODGE, MONTANA

PART OF THE BEAR CREEK COAL COMPANY'S RECENT IMPROVEMENTS

State operated by the longwall method.

The International Coal Company, of Bear Creek, managed by H. Rosetti, operated its mine 171 days during the past year, with 78 pick miners, 9 inside and 19 outside day-men, and produced 23,490 tons of coal for shipment, and sold to local trade and wasted stock coal to the amount of 490 tons. No. 3 seam was developed during the past year and is worked by means of an inclined plane from No. 3 bed to another landing, and from this landing the coal is run to the tipple by means of another inclined plane. This mine, in every way, is in splendid condition.

The Kilborn and Weber property, at Fromberg, managed by George Kilborn, employs 17 miners, 2 inside and 2 outside day-men, and during the year 1908 produced in all over 12,000 tons of coal. The mine is now ventilated by means of a furnace, but a fan ventilator will be installed some time during the year 1909. During the past year the slope was sunk deeper, a new boiler and new hoisting en-

gine was installed, and bunkers large enough to handle all of their production were built. The mine, however, is being opened with a view to permanency. The slopes, airways, and manways are all being well made, and all timbering and drainage arrangements are being constructed with a view to the concentration of work. The East Side, or old mine, is now working seams Nos. 1½, 2, 4, 5 and 6. The coal mined from these beds is hauled through and out of the entryways or slopes of seams Nos. 1½, 2 and 4. From these entryways all of the coal is dumped over the one dump or tipple.

During the year just closed, there was reported a production for shipment of 550,527 tons of coal, sold to local trade and employees 11,272 tons, and used at the mines 40,534 tons, or a total output for the year of 602,333 tons. The number of men employed is as follows: 520 pick miners, 103 inside and 150 outside day-men, or a total of 843 men, over 25 per

cent. of all of the men employed in the coal-mining industry of Montana. The sixth level east was pushed both ways from a slope driven from about room 52, fifth east entry, and the ventilation current is returned from the sixth east through the fifth east. There is more or less gas given off in the fifth west and seventh east, and several explosions have occurred, resulting in a number of men being burned. In general, the mines of this company are in good condition, and a large output is being planned for 1909.

The Smokeless and Sootless Coal Company, of Bear Creek, is managed by James Brophy, who reports having operated the mine 240 days with 10 pick miners, 5 inside and 5 outside day-men, producing for shipment 6349 tons of coal. The mine was idle 30 days on account of a strike and 30 days on account of car shortage. The company made many improvements during 1908, such as a new tipple, put in new scales, made better roads, better dwellings for the miners, and put in a new power plant and water supply.

The Washoe Copper Company, at

Washoe, managed by F. W. C. Whyte, of Anaconda, operated their mine 187 days during the year, employed 90 pick miners, 27 inside and 18 outside day-men, and loaded for shipment and sold to local trade and employees 72,862 tons. Improvements in the shape of track scales, fan, tippie and box-car loader were installed during the year just closed. The company has completed a rock slope through Nos. 1 and 2 seams, and a large output is expected during 1909.

CASCADE COUNTY

The Amalgamated Copper Company, operating coal mines at Belt, is managed by F. W. C. Whyte, of Anaconda, and until recently made most of the coal mined into coke. This company reports working the mine 243 days during 1908, and employed 37 pick miners, 90 inside and 55 outside day-men, 34 machinemen,

The system in vogue in this property is classified labor. The machinemen undermine the coal, which is done with puncher mining machines; these machinemen are followed by another set of men who drill the holes necessary for blasting down the coal—this is done by means of air drills; another set, or shooters, are employed to charge the holes and tamp and shoot down the coal; a lumberman is employed to keep secure a certain number of places; a tracklayer to keep the road laid up in his allotted number of places; and loaders are employed to separate the refuse from the coal and load it out. Practically the only improvement done at this property for the past year was the extension of the rope-haulage system on the north side of the mine.

The Louis Dahn mine is a small property at Sand Coulee. The mine was worked 100 days with 6 pick miners, 1

the mine. Much is expected of this property during 1909. A new tippie has just been finished and many other minor improvements have been made. The Nelson-Jenks Coal Company, at Sand Coulee, is managed by John Pierce, and was operated 196 days during the past year. The company employs 50 pick miners, 50 inside and 15 outside day-hands; 15 machine-men and 50 loaders. The mine produced 111,178 tons of coal for shipment, sold 597 tons to local trade and employees, and used 1837 tons at the mine. A small mine fire was found in this mine during the past season. In general, conditions are good at this property.

The Fred Schmauch mine, or the old Lewis mine, at Belt, is managed by Frank Calone, and is one of the small producers of Cascade county. The property was worked 290 days, employing 6 pick miners, 2 inside and 1 outside day-men and produced 2485 tons of coal for shipment, also 2583 tons for local trade. The only improvements for the past year were new chutes for loading the coal. There are many minor properties in this county producing from 200 to 2000 tons of coal annually, but as most of them are merely holes in the ground, they can hardly be considered as mines.

CHOTEAU COUNTY

The Havre Coal Company, near Havre, is managed by F. F. Bossnot. This mine was worked 250 days, employing 10 pick miners, 2 inside and 2 outside day men, and produced for shipment 3067 tons of coal and sold to local trade and employees 5113 tons. This mine is the largest producer in Choteau county, and furnishes all of the fuel for Havre, a thriving little city, and the surrounding country.

The Macton Coal Company, of Big Sandy, is managed by F. F. Thompson, and worked 154 days during 1908, producing 2422 tons of coal. Many improvements were made during the past year, such as new scales, a new tippie, making roads, building dwellings for the miners, installing a water system and power plant. This mine will, without doubt, be a large producer during 1909.

The Milk River Coal Company, of Chinook, is another fair producer of lignite in Choteau county, and during 1908, the mine was worked 150 days, with 8 pick miners, 2 inside and 2 outside day-men, producing 3740 tons of coal. There are several other small producers in Choteau county, but as most of them simply supply the neighborhood with fuel, no mention of them is made.

FERGUS COUNTY

The Spring Creek Coal Company, of Lewistown, is the largest property in this county. R. W. Stone is manager and the mine was worked 270 days during 1908. The mine has increased in size to a considerable degree during the past year or so, and the company now employs 70 pick

NORTHERN PACIFIC PLANT AT RED LODGE, MONTANA

and 77 loaders. The amount of coal mined during the year was 186,287 short tons. Owing to the June floods this property was idle almost the entire month.

The Cottonwood Coal Company, at Stockett, is the largest single producer in Cascade county, and the second largest single producer in the State. This property is managed by James Pearson and during 1908 the mine was worked 204.5 days. The number of men employed is 98 inside, and 111 outside day hands, 106 machinemen, and 148 loaders. The output for the year was 421,013 tons for shipment, sold to local trade and employees 2463 tons and used at the mines 9690 tons.

Everything is first class in this mine and it is remarkable that with the number of men employed by this company, not one fatal or serious accident happened during the past twelve months.

inside and 2 outside day hands, and produced about 4000 tons of coal. The Gerber Coal Company is located at Sand Coulee and is managed by Ed. Gerber. This property was worked 171 days during the year, employing 11 pick miners, 12 inside and 10 outside day hands, with 6 machinemen and 8 loaders. The mine yielded 26,269 tons of coal for shipment and 2863 tons were sold to local trade and used at the mine. This latter mine is in fairly good shape regarding ventilation, timbering and drainage in the working places. No special improvements were made during the past year.

The Lakeside Coal Company, managed by R. W. Wilson, has just begun operations in the property formerly worked by the Sand Coulee Coal Company. The present company has drained some of the workings of water by means of a tunnel. Ten pick miners, and 1 inside and 2 outside day-hands are at present employed at

miners, 17 inside, and 13 outside day-men, and 2 machinemen. The mine produced 38,318 tons of coal for shipment in 1908. The improvements made during the past year are as follows: New boiler and boiler-house; new wash-house and escape-shaft (this latter was sadly needed). The only opening to the surface was surrounded with buildings that would have caused trouble to the mine in case of fire.

The Spring Creek mine is the second property in the State to be worked by the longwall method, and at the present writing, this method is successful. There are many other mines now in operation in Fergus county, but none are large producers.

GALLATIN COUNTY

The Northwestern Improvement Company, at Chestnut, managed by C. C. Anderson, of Red Lodge, with Mr. Forsyth as resident superintendent, worked but 75 days with full force during the past year. This mine has been one of the chief sources of coal for the Northern Pacific locomotives for the past few years. It has never been, however, a paying proposition. Besides working 75 days with 106 miners, 24 inside and 24 outside day-men, as full force; 225 days were put in with 3 miners, 4 inside and 13 outside day-men. The total production for the year was 25,653 tons. Many new improvements were made during the year, such as sinking the main slope and airway 425 ft. below the second level, and the installation of a new electric pump.

PARK COUNTY

The Anderson and Evans property, located at Chimney Rock, is managed by John Anderson, and is one of the best mines in the Trail Creek field. The mine was worked, during the past year, 242 days with 33 pick miners, 4 inside and 8 outside day-men, producing in all 21,639 tons of coal. The Maxey mine is located at Chimney Rock and is managed by Wm. Maxey. The mine was worked 211 days with 27 pick miners, 3 inside and 22 outside day-men. The output for the year was 15,250 tons.

The following improvements were made at the Maxey mine during 1908: The opening of a new pair of entries on the surface to split a block of coal between the old mine and the one on the incline. The tippie remodeled and new revolving screens installed. A new system of water works was completed and several good houses for miners and their families were built.

The Montana Coal Company, of Electric, is now the only mine in the State that has its coal coked. The property is situated at the extreme southern part of the State, near the Yellowstone Park, and the coal beds have been greatly metamorphosed. Edward A. Bartl is manager and Wm. Dickinson is chief chemist. During the past year this mine was

worked 300 days with 85 pick miners, 114 inside and 109 outside day-men. The production was 65,015 tons of coal which made 29,482 tons of coke. There were built, during 1908, three lines of aerial trams to convey the coal from the mines to the ovens; No. 1 line being 4500 ft. long; No. 2 line, 8000 ft. long, and No. 3 line, 7500 ft. long. Other improvements were made, such as a complete renewal of the power plant; telephone and signal lines were rebuilt; also 5 miles of coal flume were constructed; five boilers set, and one steam and one electric hoist installed. This mine, at Electric, is in good condition and has been working more days than any other mine in the State. The coke ovens are located three or four miles from the mines. All of the coal is

tons. The improvements were a new tippie, new hoist, new boilers, new hoisting engine, new blacksmith and carpenter shop, and side tracks. At present the company is sinking two shafts, one to be used as a hoist and the other as an airway. The mine has considerable water with which to contend, but so far this has been easily handled. A new fan for ventilating purposes is now being installed and everything is being put in shape for a splendid output for 1909.

COAL PRODUCTION AND POWDER USED

An interesting feature of the Montana coal production to many coal miners and coal-mine operators is the following collected statistics regarding the use of explosives and the amount used per ton in

PORTAL OF TUNNEL, NELSON BROTHERS MINE AT SAN COULEE, MONTANA

fine when mined and is washed before going to the coke ovens.

The Trail Creek Coal and Land Company is located at Chimney Rock and is managed by Hirst Beaver. The mine was worked 198 days during the past year with 20 pick miners, eight inside and seven outside day-men, producing in all 5728 tons of coal. No improvements of any importance were made in 1908.

YELLOWSTONE COUNTY

The Republic Coal Company, at Roundup, is managed by W. W. Taylor, and is on the main line of the Chicago, Milwaukee and St. Paul railroad. The mine was operated 290 days last year with 30 pick miners, 14 inside and 17 outside day-men. The total output was 30,348

tons of coal for the year 1907, but it varies but little for 1908 and other previous years:

Kilborn and Weber, reported production, 10,102 tons; powder used, 25,000 lb., equal to 0.65 ton with 1 lb. of powder. Red Lodge reported 466,860 tons of lump and nut, 245,825 lb. of powder, which would be equal to 1.0 tons with 1 lb. of powder. International Coal Company reports 10,025 tons production, and 1200 lb. of powder used, which is equal to 8.4 tons with 1 lb. of powder.

The Bridger Coal and Improvement Company's production was 54,441 tons, while 15,000 lb. of powder were used; this is equal to 3.0 tons with 1 lb. of powder. Smokeless and Sootless Coal Company reports 5.8 tons of lump to 1 lb. of powder.

Stockett produced 2.6 tons of coal with 1 lb. powder. Nelson-Jenks Coal Company produced 2 tons coal with 1 lb. of powder. Stainsby-Latham Coal Company shows 2 tons coal with 1 lb. of powder. Ed. Gerber's reports show 3 tons gotten down with 1 lb. of powder. Matthew Richardson, 2 tons with 1 lb. of powder. Anaconda Copper Mining Company, 3 tons of coal with 1 lb. of powder. Frederick Schmauch & Co., 1.5 tons of coal gotten down with 1 lb. of powder. Millard mine, 4 tons with 1 lb. of powder. I will forego publishing a complete list of all the mines in the State, however, my general average for the entire State, not counting the mines that

in Montana by an agreement between the Montana Coal Operators' Association and the United Mine Workers of America, District No. 22, for the year commencing Oct. 1, 1908, and ending Sept. 30, 1909: "It is definitely understood that this agreement is based on an 8-hour day; an 8-hour day means 8 hours' work at the usual working place, exclusive of ½ hour for mid-shift lunch, 6 days per week, when required by the operators, Sundays and legal holidays excepted.

"However, this does not prohibit engineers, rope-riders and motormen from working the time necessary to hoist and lower men, and in no case shall they work more than 10 hours, but all such hours

SCALE OF MINING RATES AND LOCAL

PROVISIONS
RED LODGE

Mining Rates

Veins Nos. 4 and 5—per ton of 2000 lb. mine-run, 62c. Vein No. 2—per ton of 2000 lb. mine-run, 66c. Veins Nos. 1, 1½ and 6—per ton of 2000 lb. mine-run, 74c. Crosscuts in entries and rooms, \$1.60 per yd. Entries driven by hand, \$3.25 per yd. Room turning, \$10 per room.

Local Provisions

Lump coal delivered to miners, \$2.25 per ton. Mine-run coal, delivered to min-

QUALITY AND COST OF POWDER USED

The powder used in the coal mines of Montana is generally black blasting powder, running in the grades of F, FF, FFF, etc., and is furnished where the coal is mined with machines by the company. However, pick miners in all parts of the State furnish their own powder.

Black powder costs on an average of \$2.40 per keg; giant powder, 20c. per lb. "Three X" caps cost 75c. per 100; "Four X" caps, 80c. per 100; "Five X" caps, \$1 per 100. The fuse that is used in many places to fire the blast is 75c. per 100 ft. Most of the blasts are fired by means of fuse. Some miners, however, use needle and squibs.

SCALE OF DAY WAGES

The following wage scale has been adopted for the employees of coal mines

ers, \$2 per ton. Washed coal Nos. 1 or 2 delivered to miners, \$1.75 per ton. In all pillar work where track is moved or replaced, it shall be classed as shift work. There shall be a board at foot of all entries for the convenience of miners to note material needed at working places. When veins Nos. 5 and 6 are worked together and the intervening rock becomes 6 in. or more in thickness, the local officers and the company officials will fix a rate of compensation, or rock shall be lifted at the day rate.

STOCKETT

Mining Rates

Sec. 1. Machinemen, 2c. per sq.ft.; machine-helpers, 1.75c. per sq.ft., for all places over 12 ft. wide. Machinemen, 3.1c. per sq.ft., and machine-helpers, 2.5c. per sq.ft. for all places 12 ft. wide and under. In deficient places machine-runner and helper to be made up to average day rate for such class of work. The mine committee and pit boss to decide what is a deficient place.

Sec. 2. Drillers working as partners, price per coal hole, 12½c. each; price for sump hole, 32½c. each; price for lifting bottom holes, 32½c. each. Drillers who are working with helpers, 14c. per coal hole, and helpers 11c. per hole. The same conditions to apply to drillers and drill-helpers in making up deficient places as for machinemen and helpers.

Sec. 3. Loading coal, dry work, 24c., and wet work, 25c. per ton of 2000 lb. run-of-mine. No loader shall load coal in rooms, pillars or entries farther than 10 ft., and loaders shall keep all rock 9 ft. from the face; where more than the average quantity of rock exists, the company shall furnish men to clean such places.

Local Provisions

Ground rent, per year, \$8. Coal at cleaner, per ton, \$2.

SAND COULEE

Mining Rates

Sec. 1. Machinemen, 2c. per sq.ft.; machine-helpers, 1.75c. per sq.ft. for all places over 12 ft. wide. Machinemen, 3.1c. per sq.ft. and machine-helpers, 2.5c. per sq.ft. for all places 12 ft. wide and under. In deficient places, machine-runners and helpers are to be made up to average the day rate for such classes of work. The mine committee and pit boss to decide what is a deficient place.

Sec. 2. Drillers working as partners, price for coal hole, 12½c. each; price for sump hole, 32½c. each; price for lifting bottom holes, 32½c. each; price for lifting bottom holes, 32½c. each; drillers who are working with helpers, 14c. per coal hole, and helper, 11c. per hole. The same conditions apply to drillers and drill-helpers in making up deficient places as for machinemen and machine-helpers.

Sec. 3. Loading coal, dry work, 24c., and wet work, 25c. per ton of 2000 lb. run-

of-mine. No loader shall load coal in rooms, pillars, or entries farther than 10 ft., and loaders shall keep all rock 9 ft. from the face; where more than the average quantity of rock exists, the company shall furnish men to clean such places.

Sec. 4. Pick mining, 75c. per ton of 2000 lb. run-of-mine.

Sec. 5. Yardage in entries, \$3 per yd.; crosscuts in entries, \$3 per yd.; crosscuts between rooms, 12 ft. wide, \$1.50 per yd.; room turning, \$8.

All places driven over 12 ft. wide and under 18 ft. to be paid at rate of 1.50 per yard.

Local Provisions

Screened coal, per ton delivered, \$2.50. Ground rent, per year, \$8.

At other mines the scale of mining rates varies according to the local conditions that exist. The foregoing rates, however, are fairly typical of the schedules that exist in all of the other important districts of the State.

Determination of Tin and Antimony

BY EDGAR B. VAN OSDEL*

The following scheme has proved satisfactory in the analysis of alloys such as type metal or of solutions containing only tin and antimony. Arsenic, if present, would naturally be found with tin and antimony when their sulphides are dissolved in ammonium polysulphide. But it can easily be removed by precipitation as ammonium magnesium arsenate.

The solution must be free from all oxidizing agents such as nitric acid, potassium chlorate, etc., and should contain a reasonable excess of hydrochloric acid. If oxidizing agents are present they can be decomposed and removed by boiling with excess of hydrochloric acid. From 15 to 20 grams of iron wire are added and the solution boiled for a sufficient length of time to precipitate all the antimony. If the solution becomes too much concentrated, more water and hydrochloric acid must be added.

When the antimony is all precipitated, the tin will be entirely reduced to stannous chloride. Filter quickly, washing with cold distilled water; the filtrate is now ready for titration with standard iodine. Place the funnel and filter containing the antimony in an Erlenmeyer flask, sprinkle about a gram of potassium chlorate on the precipitated antimony and pour on slowly, enough hydrochloric acid to take it into solution.

Wash with hot water if convenient and add a generous excess of hydrochloric acid. Boil hard until all chlorates are decomposed and no odor of chlorine remains. Add enough cold water to insure

*Professor of chemistry, McMinville College, McMinville, Ore.

that the acid present is less than one-third and allow the whole to become cold. Then add from three to five grams of potassium iodide and titrate immediately; with sodic thiosulphate. Antimonic chloride is reduced to antimonious chloride and iodine liberated and can be titrated with starch indicator.

The main idea of this scheme is from Sutton's Volumetric Analysis and as here developed has given excellent satisfaction. The standard can be obtained from metallic antimony direct or from the copper standard; 126 copper or 120 antimony liberate 254 iodine, hence the copper standard is to the antimony standard as 63 is to 60.

New Diamond Mines in South Africa

SPECIAL CORRESPONDENCE

Apart from the New Jagersfontein Company, which produces diamonds of a finer average quality than any in South Africa, and which is closely allied to the DeBeers Consolidated, the two most important diamond mines in the Orange River colony are the Voorspoed and the Roberts Victor—both comparatively new discoveries. The latter mine, in spite of the purity of its stones, has proved a great disappointment, but the former is undoubtedly developing into a concern which, owing to its large "pipe" area, will hold a position of significance in the diamond world. It is noteworthy that both these mines, like the Premier in the Transvaal, are being equipped with direct-treatment plants in place of the floors for natural weathering of the "blue ground" employed at Kimberly. At the Voorspoed, Gates crushers are followed by grinding pans—a novel feature—and then ordinary rotary washers, from which the tailings are reground and rewashed. The capacity of the machinery is 8000 loads, of 16 cu.ft. each, in 24 hours. It is difficult to compare the relative merits of the direct crushing and the flooring processes without dealing carefully with the physical characteristics of the ground treated, but a benefit appealing with particular force to the controllers of new diamond mines lies in the greater facilities provided by a crushing plant for demonstrating the producing capacity of the mine to nervous and expectant shareholders, with the least possible delay.

Concrete mortar blocks are generally allowed to set at least three months, but at Redjang Lebong mine the reinforced-concrete mortar blocks could only be allowed 30 days for setting. These have been used for some time without showing any weakness in the concrete.

Water Losses at Broken Hill*

By T. H. PALMER[†]

While there is the constant fear of water famines hanging over the Broken Hill mines, and in view of the engineering difficulties, great cost, and length of time required to establish a supplementary supply, it is interesting to inquire whether the mines can do anything toward reduction in consumption, and whether such reduction in consumption will represent a profitable investment for capital so expended.

In starting, it is well to remember that our early concentrating methods were copied from processes found suitable for countries having an abundant water supply, where it would be folly to spend capital on water-saving appliances, and where, in some instances, it is unnecessary even to return the mill water for further work. Our limited conditions of water supply make such methods wasteful in the extreme. Radical changes, however, cannot be made suddenly, but only by degrees. This is why we still find on most of the mines numerous instances of water losses that have not yet been completely obviated. Nevertheless, so much has already been done to improve matters, that to go further demands close investigation. The purpose of this paper is to make an inquiry into the subject, and to attempt to arouse keen consideration and healthy discussion among those interested.

The number of ways in which water losses can creep into mine work is almost incredible. Water is used in such a large number of operations, and for such diverse purposes, that, unless the greatest care is exercised in design and supervision, waste is almost sure to occur. Although in a short paper like this I cannot hope to do more than treat the subject in a rudimentary manner, I hope that, by pointing out the chief causes of loss, the means of correction will readily suggest themselves.

I will consider the losses under three headings: boiler water, or all water used for steaming purposes; mill water; casual water, or all water used that does not come under the other two headings.

BOILER WATER

Losses of boiler water can be subdivided under three heads: (a) in its conversion to steam; (b) in its distribution of steam to engines; (c) after it is exhausted from engines. All losses occurring under (a) or (b) increase the coal consumption.

In its conversion to steam there are losses due to leakages and blowing off. In

a well attended boiler plant, however, leakages are likely to be trivial, but the quantity blown off depends almost entirely upon the quality of the feed water. At Broken Hill this loss is considerable. About half of this blow-off water can readily be saved and used in the concentrating mill, but probably considerable of the original feed water escapes in the vapor form, and it would not pay to recover this. Those mines which condense a considerable portion of the exhaust steam and return it to the boilers have a proportionately smaller amount of blow-off loss.

In the distribution of steam to engines, leakages and condensation are likely to occur in the pipes. Especially with high-pressure steam, leakages are very difficult to keep entirely under control. Occasionally, however, through irregular work, or, perhaps, negligence, the safety valve will blow off. The greatest loss usually arises from condensation in the pipes, which is considerable with long lines, or where effective superheating is not in vogue. If steam traps are used it is seldom one notices any attempt to collect the water for further use.

After it is exhausted from engines it is where the most serious of all the boiler water losses occur.

Two rival condensing methods are in use: one surface condensing, the other atmospheric condensing. The surface-condensing method attempts a saving of fuel as well as of water, but fails as a water saver, since water losses in the cooling tower are greater than the quantity condensed. Moreover, the variations in climatic conditions, coupled with the high cost of water, make it necessary to have a much larger plant in Broken Hill than at more favored places. A surface-condensing plant, if designed to suit winter conditions, would prove highly profitable during the cold weather, but would be quite inadequate for the summer months. If designed large enough for the hottest day, the capital cost is too great to permit of adequate interest being made out of the saving of fuel—at least from the point of view that a mining company reckons. Additional objections are: The constant expert attention necessary; the risk of failure; its unsuitability for winding engines, pumps, compressors, and other intermittent steam units.

Atmospheric condensing aims only at a saving of water from the exhaust steam of engines that is pure and suitable for the boilers. The plant consists of a series of tanks built of galvanized corrugated iron, through which the steam passes, and finds a large area of cooling surface to condense on. The plant is cheap to install, costs nothing to operate, needs no attention, and the cost of upkeep is small. The exhausts of all steam engines can be turned into it. It is a method that has many advocates at times of water famine, and under ordinary conditions is far more

profitable than its rival, surface condensing.

MILL WATER

The losses of mill water may be subdivided into four classes: irregularities due to neglect; leakages; evaporation; and in the products.

Irregularities occur more frequently than one would imagine, and loss due to neglect is large enough to deserve mention. There are innumerable ways in which this can happen, of which stoppages of return pumps, elevators, and other machinery are usually the most serious. Sometimes the storage tanks are allowed to overflow. In order to reduce such losses catchment tanks of large capacity are required, and should be connected with the suction of the mill return pumps.

Leakages, where seen, are usually corrected, and do not form a serious proportion of the mill losses. It is the unseen leakages that are liable to be important factors. It is likely that the old concrete floors are cracked in a number of places, which let the water through, and these are not suspected, being covered over by dirt and slime. It is impossible to estimate losses from this cause.

Evaporation must play quite an important part in mill losses. There are a very large number of wetted surfaces. Exposed timber, floors, launders, and all woodwork are porous, and suitable for rapid evaporation, and, with tables and vanners, present numerous surfaces. The low temperature of concentrating mills in hot weather is indicative to some extent. I have often tried to gage this loss, but my computations are very rough. Nevertheless, I believe that, on a very hot day, fully 15 gal. of water are evaporated for every ton of ore treated. The only way to reduce this loss would be to limit the circulation of air, and that would affect the lighting. Moreover, the loss is only large in the summer months.

The water entangled with the products represents a continuous loss that can be estimated and is found to be large. Concentrates and coarse tailings in trucks are usually allowed to stand on the mill floors for some time to drain before being disposed of. These products usually go out with from 8 to 12 per cent. of admixed water, equal to, say, 18 to 24 imperial gal. of water per ton of ore treated. To reduce this loss, and to save handling expenses, some of the mines have erected draining vats and conveyers, by which about half of the above-mentioned loss is saved. In the slimes and vanner tailings the loss varies greatly at the different mines, but is always very high. In most cases the slime is allowed to flow to its destination, where the water is clarified in pits and returned for further use. Losses of water occur by soakage, evaporation, and by breaks in the dams, and are very great. This method is very costly in loss of water, pumping costs, upkeep of

*Abstract of a paper read before the Scientific Society of Broken Hill.

†General manager, Broken Hill Junction North Mine, Broken Hill, New South Wales, Australia.

pits, and area occupied by the pits. I am inclined to think that thorough unwatering with mechanical disposal will be found more economical, provided a dumping site can be found within reasonable distance of the mill.

CASUAL WATER

By casual water I mean water used for all purpose other than for boilers and in ore treatment; it includes that used in the change house, offices, surface standpipes, fire service, etc., and for water jets underground. Men are very wasteful in the change house, and often use many times more water than they require from a prevailing spirit of extravagance. If this water can afterward be used profitably in the mill, such extravagance does not matter much, but otherwise it is an item in the costs, and can be kept within control by reducing the pressure in the mains. Standpipes about the surface are apt to be a source of great annoyance and waste. Men like to run off 40 or 50 gal. of warm water on a hot day, so as to finally get a cool mouthful. Any inventive mind can rectify this waste. In the mine the use of water jets with the rock drills is apt to be abused. I have often seen the holes being bored dry, and the jet turned into the ore chute. Water for the jets is usually seepage caught at various levels, and made to do work on its way down to the pumps. No doubt there is some waste, but not much, and this is usually a matter of little importance.

To show how much can be done in the direction of water savings, the consumption at the Junction North mine was recently over 200 gal. of mine water and over 200 gal. of fresh water per ton of ore treated. Now it is 150 gal. of mine water and 40 gal. of fresh water per ton of ore. I hope to reduce the consumption still further, so as to use about 90 gal. of mine water and 4 or 5 gal. of fresh water per ton of ore. The fresh water will then only be used in the offices and change house.

WATER SAVING AT THE JUNCTION NORTH MINE

There is a liberal water supply available in the underground workings of the Junction North mine, and the policy has been to make this sufficient for all requirements, so that the company will be entirely independent of all outside water schemes, and safe for periods of water famines, in addition to the saving of costs that will come about. The water contains 673.36 grains of solids in a gallon, or 0.9619 per cent. by weight, as follows:

	Grains per Gal.	Per Cent
Silica	1.47	0.0021
Oxides of iron and alumina	2.24	0.0032
Calcium sulphate	117.32	0.1587
Magnesium sulphate	155.34	0.2220
Zinc sulphate	67.52	0.0905
Sodium chloride	306.85	0.4384
Loss on ignition	14.42	0.0206
Unaccounted for	14.26	0.0204
Totals	673.36	0.9619

This water is quite suitable for milling purposes, but could not be used in the Babcock & Wilcox boilers. But, owing to the fact that 78.7 per cent. of the solids are soluble in very strong solutions, it was deemed suitable for Lancashire boilers. The magnesium sulphate was not thought likely to cause priming if only a limited amount of power was demanded. Accordingly, a very suitable arrangement has been made, and is now in use, by which the boilers use only mine water for the make-up feed supply.

To accomplish these results a very complete system of atmospheric condensers has been installed to deal with the exhaust steam from every engine on the mine. There are 38 atmospheric condensing tanks coupled together in three systems. Each system has a wrought-iron breakdown tank, or feed-water heater, to take the impact of the exhausts. The condensed water gravitates to the boiler-feed tanks, and the Babcock & Wilcox boilers are fed exclusively with it, so that blowings off and cleanings are reduced to a minimum with that type. Mine water to represent the "make-up," amounting to nearly 20 per cent. of the total feed water in hot weather, is fed to two Lancashire boilers, which have been retained for operating the winding engine and No. 2 compressor. In these boilers there is a fair amount of sediment and scale formed. Blowings off and cleanings are needed frequently, but the whole is an economical and reliable arrangement, not only from a water point of view, but a reduction is already noted in the coal consumption by reason of the cleaner condition of the Babcock & Wilcox boilers. Although only lately set to work, it is evident that quite 80 per cent. of the original boiler-feed water will be saved in the hot weather, and this represents in cash a saving of more than 100 per cent. per annum on capital outlay after allowing liberally for repairs and depreciation. Eight of the tanks have been in use for over 18 months, and, except for a little soldering, have cost nothing for repairs. It is only fair to mention that the surface plant is so distributed that the mine possesses singular features in favor of the system by which the exhausts from all engines can be collected economically. In the mill a number of details are being given a trial in order that water losses will be reduced to a minimum. On the surface a drainage system of pipes is about to be put in, by which waste water will be collected from offices, change house, concentrates bins, and will be led to a boiler and economizer blow-off tank, from which it will be returned to the mill.

The *Queen's Gaz. Min. Journ.* places the value of the output of the copper mines of New South Wales for 1908 at £302,812. This is £224,062 less than in the previous year.

Mineral Production of Germany

The production of metallic ores—other than iron—in the German Empire for the years 1907 and 1908 is reported as follows, in metric tons:

	1907	1908.
Gold and silver ores	8,279	7,651
Copper ore	771,227	727,384
Lead ore	147,272	156,842
Zinc ore	698,425	706,441
Manganese ore	73,105	67,693
Various ores—tungsten, etc.	7,097	8,718
Arsenic ore	4,878	6,081
Pyrites	196,351	219,455
Other sulphur ores	1,010	411

A considerable decrease in copper ore, and small increases in lead and zinc ores are the chief features of the statement. The figures are taken from *Glückauf*, being an advance statement from the Imperial Statistical Office.

NONMETALLIC PRODUCTS

The nonmetallic production—other than coal—is as follows, in metric tons:

	1907.	1908.
Graphite	4,033	4,844
Asphalt	126,649	80,009
Petroleum	106,379	141,900
Rock salt	1,285,138	1,327,453
Sulphur	2,024,412	2,590,804
Other potash salts	3,124,956	3,500,635
Kieserit, glauber salts, etc.	5,503	6,505
Boracite	114	128

There was a gain in potash salts, but a decrease in several of the minor products.

METALLURGICAL PRODUCTS

Metals and other products of metallurgical works were as follows, not including iron and steel, which are given elsewhere:

	1907.	1908.
Gold	4,682	1,758
Silver	386,933	407,833
Copper	32,473	30,329
Lead	146,096	169,418
Zinc	208,195	216,490
Arsenical products	2,904	2,832
Sulphur	1,766	2,810
Sulphuric acid	1,393,308	1,385,710
Copper sulphate	5,284	7,717
Zinc sulphate	5,145	5,310
Iron sulphate	14,033	15,738
Metallic pigments	4,409	3,936
Miscellaneous	6,684	7,230

Gold and silver include metal from foreign ores. Under tin there are given 5838 tons in 1907, and 6375 tons in 1908 of tin manufactures, as well as 1812 tons in 1907 and 2266 in 1908 of tin salts. These were made from imported ores and metal. Copper in 1908 included 328 tons black copper, the rest being refined metal.

POTASSIUM AND OTHER SALTS

The production of potassium and other salts in commercial form was as follows, in metric tons:

	1907	1908
Salt	665,116	665,413
Potassium chloride	174,138	508,622
Magnesium chloride	32,891	29,775
Glauber salts	80,347	72,667
Potassium sulphate	60,292	55,755
Potassium-magnesium sulphate	33,368	33,149
Aluminium sulphate	11,103	42,976
Alum	59,173	54,122
Alum	1,200	3,802

On the whole the production of potassium salts, of which Germany has almost a monopoly, was fairly well maintained last year.

A Blast Furnace of Oval Section*

At the recent meeting of the Iron and Steel Institute in the Middlesbrough district in England, visiting engineers were much interested in No. 5 blast furnace of the Newport Iron Works, recently built. The peculiarity of this furnace is its form, which is oval, not circular, the design being the patent of Francis Samuelson and William Hawdon. The aim of the inventors was said to be to obtain a large output with a lower initial cost, and a more economical operating cost.

REQUIREMENTS OF A FURNACE FOR LARGE PRODUCTION

The three essentials in a plant for large makes are: The necessary area in the melting zone of the furnace, or at the level of the tuyeres, where the oxygen of the air blown in is brought in contact with the fuel which, of course, produces the necessary heat to smelt the ore; capacity of blowing engines, by which is understood the necessary volume and pressure of blast; and sufficient stove capacity to heat up the volume of air to the required temperature.

American pig-iron makers obtain the first essential by increasing the diameter of the well of the furnace at the tuyeres to get the larger area at the melting zone. This, of course, has necessitated a corresponding increase in the power of the blowing engines, in order to obtain the necessary blast pressure to penetrate the additional mass of ore in the well of the furnace. It is well known that if the mass is not thoroughly penetrated by the blast, a center cone remains unmelted, which not only adds materially to the consumption of fuel, but prevents the making of good iron.

COST OF HIGH BLAST PRESSURE

This increased pressure is the principal and most serious matter for consideration. Increased capacity, as regards dealing with the volume of air for increased makes, is necessary in both blowing engines and stoves. The stoves, to withstand the higher pressure, have to be more strongly built, and are, therefore, more costly. But the most costly item, and the one which it was sought to avoid in the oval furnace, is the enormous strength requisite in the blowing engines, which, of course, increases with the pressure of blast required, and because of the additional strength required to withstand the higher pressure, the air mains and adjuncts are also more costly. A blast pressure of 5 to 6 lb. per square inch was usual under the older designs; one of 12 to 15 lb., or even more, is common with the new design adopted in American practice.

The oval furnace built by Messrs. Samuelson at Newport is blown by the old blowing engines, and works on a pressure of 6-lb. blast with very great regularity, while the results, both as regards make and fuel consumption, are highly satisfactory. The furnace, which is making Cleveland iron, averaged over the three months ending with May last, an output of 1344 tons per week, the best four weeks averaging 1447 tons per week. The installation of this furnace required no alteration in the existing plant.

It is obvious that an engine giving 15-lb.

advantage where there are steel works in connection with the blast furnaces.

CONSTRUCTION OF THE FURNACE

The inventors claim that the adoption of their oval furnace, whether in an old or new plant, is productive of this valuable saving of power in the blast. The accompanying views show, in Fig. 1, half cross-sections of the furnace at two points; in Fig. 2 a half sectional elevation, and in Fig. 3 a cross-section at the tuyeres. It will be seen from these sections that the oval well on its minor axis is much

FIG. 3
OVAL SECTION BLAST FURNACE AT MIDDLESBROUGH

per square inch pressure of blast requires about two and one-half times the horsepower of an engine blowing 6-lb. blast pressure, in addition to which the boiler capacity must be proportionately greater. Blowing engines made for such high pressures are costly units, and require considerable labor and attention in repairs. Hence, well on to 50 per cent. of the horsepower required for the production of the higher pressure of blast is saved in an engine of lower pressure, and this power becomes available for generating electricity, or for other purposes—a great

narrower than a round furnace would be. The distance, therefore, from tuyere to tuyere is less, and consequently a lower pressure of blast penetrates the material in front of the tuyeres and at the melting zone in the furnace. With a round furnace of the same area, the diameter is necessarily large, and consequently there is a greater distance from tuyere to tuyere. Therefore, a greater pressure of blast becomes necessary.

Fig. 1 shows how girders are placed both round the shell and vertically, to strengthen the oval form. The pressure

*Abstract of article in *Iron and Coal Trades Review*, London, England.

of materials inside the furnace, without this support would tend to bulge out the sides of the oval. These girders are composed of 9-in. beams at the ends, and increased to 4 ft. by $7\frac{1}{2}$ in. deep lattice girders of the sides. The charging bell is oval, giving an equal distribution of materials at the top of the furnace, which is maintained throughout the melting process.

RESULTS FROM THE FURNACE

A certain amount of doubt was expressed by experts as to whether the oval would work with as great regularity as the circular form, but this has apparently been quite set at rest by the very regular working of the furnace in question, which has since its erection, given less trouble than almost any other furnace at Newport works. It is also said by the builders and owners that while the make of the furnace is large, the iron is also more regular in quality than that from the old furnaces at the same works. This regularity is an advantage which must be appreciated by all furnace operators.

Apparatus for Surveying a Bore-Hole

In a recent issue of *Annales des Mines de Belgique*, Jean Florin describes the construction and operation of a novel device for determining the strike of the strata and the direction of a bore-hole at its bottom. The merits of the apparatus are that all clock motions and other complicated mechanisms are avoided, that it does not need to be built with the strength necessary to withstand great pressure, that its operation is simple, its cost small, and its accuracy perfect.

In brief, it consists of a brass box, filled with water, in which is suspended by rubber bands *i*, a simple photographic camera *a*, below which are a magnetic needle *b*, a phosphorescent disk *c*, and the interchangeable soft lead disk *d*. Holes *e*, around the top of the box, protected by shields and wire gauze, allow the box to fill with water while excluding light and dirt.

The photographic camera is a metal box *a*, inside the top of which can be placed a round frame carrying a sensitized celluloid plate *f*. This is so placed as to receive the image of the magnetic needle and certain reference marks on the phosphorescent disk. The lens has a focus of about 4 cm., and is ground with special reference to the refraction between glass and water. In front of the lens is the shutter *h*, which is operated by pressure on the end of a rod which projects down through the bottom of the outer box.

The magnetic needle is supported freely, its vibrations not being restrained at any time. Immediately below the needle is the copper disk *c*, coated with a substance, containing calcium sulphide, insoluble in

water. On the disk are also drawn black lines to serve as reference marks.

At a short distance below this is a disk of phosphorus bronze *g*, of a sufficient thickness to stand some battering, through which are bored four holes of different sizes. These holes serve as points of reference to assure that the lead disk does not move while the apparatus is in operation; other reference marks allow the bronze disk to be placed always in the same position. At the very bottom is a disk of soft lead intended to receive on the outside an impression of the stump of the core, and on the inside an impression of the four holes in the bronze disk.

PREPARING THE APPARATUS FOR USE

To prepare the apparatus for use, the

SECTION OF INSTRUMENT FOR SURVEYING BORE HOLES

phosphorescent plate is first excited by a flash from a short piece of magnesium ribbon; the illuminating power will last for four or five hours. The disk is then replaced and the bronze and the lead plates are firmly secured. The sensitized plate is then put in, in a dark room, the top is closed, and the entire apparatus is filled with water, care being taken to remove all air bubbles. If the temperature of the water encountered in the bore-hole is likely to be higher than the melting point of the gelatine on the sensitized plate, before putting the plate into position it can be treated with a 5-per cent. solution of formaldehyde, which makes

the gelatine insoluble and yet does not interfere with the exposure nor the development.

Having freshly broken off the core and marked it distinctively by a blow from a chisel bit, the brass box is lowered on the end of the drill rod. The weight of the rods causes the desired impressions to be made on the lead, and at the same time the shutter of the camera is opened. The magnetic needle soon comes to rest, and an exposure will generally take 20 to 30 min. On drawing up the rods the shutter closes.

The data given by this operation are an impression of the bottom of the hole, on the under side of the lead disk and on the upper side, the marks of the four holes, which orient the lead disk with respect to the camera. On the sensitized plate, after development, are seen the image of the needle and of the black marks on the phosphorescent plate. From these data the strike of the strata and the direction of the bottom of the hole can be ascertained.

Although the author does not mention it, it would appear quite feasible, by supporting the camera box in such a way that its axis should always be vertical, to ascertain the deviation of the hole from the vertical by noting the distance that the center of the needle appears to be offset from the center of the developed plate. The use of a phosphorescent illumination also appears to be a decided improvement over any kind of electric lighting.

Prices of Lake Iron Ores

The average prices of Lake iron ores in Cleveland in early days are given in an interesting historical article in the *Marine Review*. For the year 1857, the average selling price of ore per ton was \$8; in 1858 it was \$6.50; in 1859 it was \$6; in 1860, 1861 and 1862 the average was the same each year, or \$5.25 per ton; in 1863 it was \$7.50; in 1864 it was \$8.50; in 1865 it was \$7.50; in 1866 it was \$9.50; in 1867 it was \$10.50; in 1868 and 1869 it was \$8.25; in 1870 it was \$8.50; in 1871 it was \$8; in 1872 it was \$9; in 1875 it was \$7; in 1876 it was \$6.75; in 1877 it was \$6.50; in 1878 it was \$5.50; in 1879 it was \$6.25; in 1880 it was \$9.25; in 1881 it was \$9; in 1882 it was \$9, and in 1883 it was \$6.25 per ton.

The Rhodesian Chamber of Commerce has asked the government to appoint a medical commission to investigate sanitary conditions among the Kafir laborers employed in the mines. These appear to be improving, as the average death rate fell from 73.18 per 1000 in 1907 to 48.78 in 1908. The principal diseases prevalent among the Kafirs are pneumonia and scurvy.

Electric Mine Signaling

An ingenious method of shaft signaling by electricity, as adopted at two of the shafts of the Grand-Hornu company, is described in a recent issue of the *Annales des Mines de Belgique*. Alternating currents, of 110 volts and 25 cycles, are used at both places; this permits a simpler construction of the bells than when a direct current is used. The system is so designed that a signal rung from underground will sound both at the landing floor at the surface and in the hoisting room, and also so that signals can be sent from the landing floor to the hoisting room and to the underground station.

FIG. 1. WIRING SYSTEM AT NO. 9 SHAFT GRAND-HORNU COMPANY

At No. 9 shaft all the hoisting is done from the one level. At the bottom and at the landing floor are placed a bell and a contact point and at the hoist is a bell, but no contact point; they are all inclosed in cast-iron boxes, tinned to prevent rust. The cable has three 1-mm. copper wires, in an iron casing attached to the timbers in the shaft.

The arrangement of the wiring is shown in Fig. 1, in which the arrows point the direction of the current while a signal is being given from the bottom. It is seen that the bell at the bottom rings at the same time as the others. All three bells

can also be rung by making contact at the landing floor.

At No. 7 shaft hoisting is being done from both the 550- and the 710-m. level. To avoid confusion in the hoisting room and at landing floor, the bells connected with one level are made of bronze and those connected to the other level are made of steel; by this means two different tones are produced. The wiring is also arranged so that a signal given from one level is not heard on the other level, thus avoiding unnecessary confusion. In Fig.

FIG. 2. WIRING SYSTEM AT NO. 7 SHAFT, GRAND-HORNU COMPANY

2 the arrows show the direction of the current at the moment the operator on the 710-m. level is giving a signal; his own bell rings with the others.

The signals are given in the same code as with a bell operated by rope, but it is also possible to use a system based on long and short strokes.

It is announced by *l'Echo des Mines* that an agent of the Carnegie Steel Company, while searching for manganese ores in India, discovered a valuable deposit of tungsten ore in the Central Provinces, near Nagpur.

The Sturtevant Ring Roll Mill

A new crushing roll has recently been introduced by the Sturtevant Mill Company, of Boston, Mass. This roll consists essentially of a massive outer ring, with a concave inner face, which revolves vertically. Within this outer ring revolve three rolls with convex faces; these are pressed by springs against the concave inner face of the outer ring. They are usually adjusted to crush at about 20,000 lb. pressure. When the machine is in operation the inner face of the outer ring is covered with a 1-in. layer of material to be crushed.

The outer ring is bolted to a massive head which is revolved at about 75 r.p.m. by its horizontal shaft. There are no shields for the prevention of wobbling, the massive construction being ample provision against this fault. The whole front of the mill opens like the massive door of a safe, swinging the rolls and their parts outside and exposing the whole interior. The outer ring alone is left inside; thus it is easily accessible for examination or replacement. On closing the door the three inner rings and all their parts swing into place, the adjustment of the pressure being controlled by a screw on the outside of the door. Provision is made for holding the inner roll away from the outer ring.

Material to be ground is supplied by an automatic feeder to the middle of the concave outer ring, by way of a chute. The inner rolls do not come in contact with the outer ring, but work on the layer of material, gradually forcing the fines off of both sides of the track. The mill takes material direct from a rock breaker in 1½ in. or smaller size.

The first award of a prize for discovery or invention under the will of Aeneas McCharles, who left a fund of \$10,000 for that purpose, will be made this year by the board of governors of Toronto University, Toronto, Canada, the amount being \$1000. It will be open (1) to any Canadian who invents or discovers any new and improved process for the treatment of Canadian ores, or minerals, after such process has been proved to be of special merit on a practical scale; or (2) for any important discovery, invention or device that will lessen the dangers and loss of life in connection with the use of electricity in supplying power and light; or (3) for any marked public distinction achieved in scientific research in any useful practical line.

A sanatorium for patients suffering from miners' phthisis (*Aust. Min. Stand.*, Dec. 23, 1908) is to be erected on the Rand. The mines propose to allot £13,000 for its erection, and the government is to be asked for material support.

The Diamantina District of Minas Geraes

By G. W. LINDSAY*

Diamonds are found in Brazil in three separate districts: (1) In the state of Bahia, near the east coast of Brazil; (2) in the northern part of Minas Geraes; (3) in the far interior, in the states of Goyaz and Matto Grosso. The Bahia district has produced comparatively few diamonds of the finest quality and is noted chiefly for the production of carbonados, or black diamonds, used in diamond drills. By far the greater proportion of the world's supply of carbonados comes from this field. The diamond-producing district in Goyaz and Matto Grosso is as a whole practically unprospected. Its great distance from civilization, and the absolute lack of transportation facilities make it of no practical importance at present.

The chief source of Brazilian diamonds is what is known as the Diamantina district, situated in the northern part of the state of Minas Geraes, about 500 miles north of Rio de Janeiro. This field is a narrow strip from 20 to 40 miles in width extending from the headwaters of the Jequitinhonha river, down this stream for about 200 miles.

DISCOVERY AND EARLY PRODUCTION

This field was worked for gold as far back as 1670. In 1729 diamonds were discovered in the streams and for many years the Crown of Portugal exploited this district on a large scale, importing negro slaves for labor. When Brazil became an independent empire the work was continued under the direct protection of the state. During this period the output of the district reached its maximum, about 150,000 carats annually.

For about a century and a quarter Brazil produced nearly 90 per cent. of the world's supply of diamonds. In the latter half of the last century the output of this region suddenly decreased, until in 1800 only about 1000 carats were taken out. This was due to several causes, chief among them being the exhaustion of the more easily worked placer deposits, the loss of the slave labor, etc. Since 1890 the output has slowly increased, until in 1905 about \$200,000 worth of diamonds were sent out. American companies have recently obtained large concessions in this region, and with the application of modern machinery and methods it is expected that this district will again take rank as an important diamond-producing field.

SOURCE OF THE DIAMONDS

The original source of the diamond-bearing ground in this district was apparently a number of "pipes" or funnels, through which the diamondiferous clay

was forced up to the surface. These pipes are thought to be similar to those which are being worked at present in South Africa. If they should prove so, they will undoubtedly become the chief source of diamonds in this district. At present this class of deposit is undeveloped, and its value is more or less conjectural.

From these primary deposits the diamonds were scattered all over the district, being found in a sheet of conglomerate which apparently at one time overlaid the entire region. Scattered through the district many small patches of this conglomerate are still found in place on the hill sides. It is a deposit ranging in thickness from 2 to 6 ft., consisting of coarse water worn gravel firmly cemented together. It is worked to some extent by the natives, and in some instances might yield largely on the application of modern machinery and methods.

PRODUCTION FROM PLACER WORKINGS

The greater part of this conglomerate has been washed down into the Jequitinhonha and its tributaries by the excessive tropical rainfall, forming a series of exceedingly rich placer deposits. It is from these placers that practically all of the diamonds produced thus far have been taken. The method formerly employed was to dam the stream, carry the water off by means of ditches or rough flumes, and dig out and wash by hand the bed of the river thus laid bare.

With thousands of negro slaves to supply the needed labor, it was possible to work the smaller streams and even the Jequitinhonha itself for some 30 miles from its headwaters, by this crude method. But as the smaller streams were worked out this method became more and more expensive and difficult, until on the freeing of the slaves it was abandoned altogether. Since that time no attempt at mining on a large scale has been made in this district until the last year or two.

DIAMOND-WASHING DREDGES

Several American companies have obtained concessions on the Jequitinhonha, and two modern gold dredges, adapted to diamond saving have been already installed. The larger of these dredges is of the standard endless bucket-line type, with 3¼-cu.ft. buckets and a digging capacity of from 1800 to 2000 cu.yd. per day. The process used in recovering the diamonds is simple. The gravel dug up is carefully sized in a series of trommels, and the gravel from one-sixteenth to three-fourths of an inch in size is jigged. The diamonds are sorted out from the jig concentrates by hand. The sand is run over gold-saving tables in the ordinary manner, no attempt being made to save any diamonds it may contain. These river placers usually run from 5 to 15c. per yd. in gold besides their diamond values.

The diamonds from this field are of

the first quality and color, and the average size of the stones is also good, though in Africa many individual diamonds have been found much larger than any yet discovered in Brazil.

Iron and Coal in Germany

The official report of the iron-ore production in Germany for the full year, as published in *Glückauf*, gives the totals mined as follows, in metric tons:

	1907.	1908.
Elsass-Lothringen.	14,107,518	13,281,589
Luxemburg.	7,492,870	5,790,280
Other districts.	6,096,740	5,152,487
Total.	27,697,128	24,233,356

In 1908 Elsass-Lothringen furnished 54.8 per cent. of the total output, and Luxemburg 23.9 per cent.

PIG IRON PRODUCTION

The official statement of pig-iron output is as follows, in metric tons:

	1907.	1908.
Foundry iron.	2,048,502	2,102,375
Direct castings.	71,377	71,466
Forge iron.	900,239	696,373
Spiegeel and other alloys.	931,140	857,067
Bessemer (acid) iron.	478,011	422,443
Thomas (basic) pig.	8,428,334	7,657,884
Scrap, iron, etc.	17,556	17,708
Total.	12,875,159	11,805,321

This statement differs slightly from that of the German Iron and Steel Union, heretofore published, which is based on current reports from furnaces.

FINISHED IRON AND STEEL

The forms in which iron and steel products were put upon the market are reported as follows, in metric tons:

	1907.	1908.
Castings (second smelting)	2,533,446	2,306,678
Wrought (puddled) iron.	617,900	491,318
Crucible steel, all forms.	40,443	26,306
Steel ingots.	670,882	870,080
Blooms, billets, etc.	1,980,195	1,809,229
Finished steel, all forms.	8,736,010	8,125,749

The forms given for steel are those in which the metal was sold by the works where it was made. The steel ingots, blooms, etc., were worked into finished forms at mills which do not make their own steel.

COAL PRODUCTION

The production of coal in the German Empire is given as below in metric tons:

	1907.	1908.
Coal.	143,145,691	148,537,517
Brown coal (lignite).	62,546,671	66,746,057
Total.	205,732,362	215,283,574

The total increase in 1908 was 9,551,212 tons, or 4.6 per cent. Brown coal, or lignite, was 30.4 per cent. of the total in 1907, and 31 per cent. last year.

The directors of the Mount Bischoff Tin Mining Company, Tasmania, have declared the 383d dividend of 5s. per share. The amount of dividend is £3000, which brings the total paid by the company up to £2,100,000.

*Mining engineer, Morenci, Arizona.

Locus of Vadose Ore Deposition

By CHARLES R. KEYES*

By reason of their direct practical bearing upon the local occurrence of ore-bodies according to definite lines of geologic structure the results of recent investigations in the Ozark region have proved to be of exceptional interest to the mining industry. For the first time in the history of the development of the region no definite data appear for quantitative considerations. The principles involved have, moreover, a much wider than local application.

The principal lead and zinc deposits of the Ozark region are strictly vadose accumulations. In the main the orebodies correspond to the enrichment zone of normal fissure-veins. Otherwise there is no resemblance between the two classes of orebodies. There is, in reality, no zone of impoverished oxidized ores above, nor of a normal low-grade orebody beneath. Moreover, the general migration of ore materials has been in a lateral direction rather than merely downward, as is usually the case. In this general side-movement the direction and interference of ore movement has been controlled very largely by local geologic structures. Among the latter the basin, trough, or syncline has been the leading type.

The general association of the workable ore deposits of the Ozark region with basins appears far more significant than a first glance might suggest. It seems to make small difference what is the origin of these basins. They may be formed by true synclines, in flexed strata by old erosion-troughs along planes of unconformity, by warplings of impervious strata, by cross-folds in structural troughs, by solution cavities, by underground waterways dammed by debris, by faulting, by dike-intrusions, by lack of local erosion in sloping strata, or even by other features. The principal point to be considered is that the introduction of these structures gives rise to an impounding of the underground waters; and a production, on new lines, of all of the old conditions of permanent ground-water-level.

Sulphatic waters passing into or through such subterranean ponds invariably deposit some of their metallic salts as sulphides just as they do in the enrichment zone of normal fissure-veins. How the precipitation takes place is, in the present connection, immaterial. It may be through means of the mingling of different currents, the presence of organic matter, the association of carbonaceous materials, or the presence of decomposing sulphides. In this zone and under im-

pounding conditions there are usually present at all times an abundance of adequate reducing agents.

In the Southeast Missouri Lead district the localization of the orebodies appears to be influenced chiefly by the character of the Pre-Cambrian troughs eroded out of the much older granites. The Central Missouri district presents true structural troughs, or synclines, as the controlling feature, although subterranean channelways now filled with sandstones and bituminous shales or clays have occasioned minor orebodies. Both synclines and faults have produced basin conditions in the Northern Arkansas district. In the Upper Mississippi Lead district synclines alone of the original geologic structures are the determining factors.

Conditions are complex in the Southwestern Missouri Zinc district. That they appear more complicated in this area than in other districts may be due partly to the fact that this district has received more detailed study than any of the other fields. The great Springfield-Joplin syncline pitching westward down the slope of the Ozark dome clearly explains many of the former puzzling features connected with the distribution of the orebodies. The cross-arches long known in the vicinity of Galena, Joplin, Webb City, Carthage and other places are thought to be of first importance in ore-localization. Close-patterned warping of the strata has been suspected ever since the detailed large-scale topographic maps of the Carthage, Joplin and other quadrangles were first constructed by the Missouri Geological Survey more than a decade and a half ago. Although not so accurate as it might be, but still presenting the broader features fairly well, the late publication by the U. S. Geological Survey showing the underground contours of the Grand Falls Chert surface, displays in a remarkable manner the relationships of the orebodies and the basins.

Orebodies in large solution cavities, particularly along the master-lines of jointing, and in dammed underground waterways, are also of common occurrence in the Joplin district. Corrosion-channels in the plane of unconformity at the base of the Coal Measures do not at present appear to exist. So far as personally known the debris-sandstones and shales usually found in this connection are not depositions of Carboniferous age at all. All appear to be fillings of very recently formed underground channelways that have caved in or filled up without the roofs giving away. As such there must be seldom any real relationship between the pre-Cool Measures drainage-lines and the orebodies.

The Ozark region is a field in which some of the structural features mentioned are not at first sight easily determined. The general dips of the strata are so small, the flexing so slight, the

warping so close-patterned that it has been only through the application of the most recent and refined methods of investigation that the actual proofs of some of the former deductions were secured. The delicacy of the standard of measurement may be judged when it is stated that warping or flexing of less than a dozen feet may give rise to basins holding the largest of orebodies. The principles involved are perhaps best considered by referring first to examples of other regions where with the same vertical values, the lateral components are infinitely smaller and the angles much higher.

In the Joplin district the profile of the Grand Falls chert, along a line passing through the principal mining camps, brings out several important features. The leading orebodies are seen to be located in the troughs due partly to the close-patterned warping and partly to definite parallel-flexing. The ridges of Galena, Joplin, Webb City, and Carthage, for example, are true anticlines trending nearly northwest. They are the cross-bars of the Springfield-Joplin syncline which pitches nearly due west. The orebodies are thus seen to have definite relationships with the local geologic structures. It seems very probable that the retreating margin of the impervious Coal Measures shales has had an important influence in impounding the underground waters by raising the groundwater level. There is good reason for believing that this has been the direct cause of the localization of many of the orebodies of this district. As the inclination of the groundwater surface is not as great as that of the strata there would be raised at once, at the point where the groundwater-level intersected the basal plane of the Coal Measures formation, a formidable barrier, or dam, which would impose extensive impounding conditions. The Joplin district appears to be just such an area.

In the Central Missouri mining district the series of parallel synclines imparts conditions similar to those of Joplin with the Coal Measures not far away. The orebodies appear to be confined entirely to the bottoms of the structural troughs. With this conception of the field systematic prospecting should make this area a very much more important mining district than it now is.

The general structural conditions in the Southeastern Lead district are also similar to those in the Southwestern area. Corresponding to the warped surface is the uneven erosion surface of the unconformity-plane at the base of the Cambrian rocks. Instead of porous zones, caused by brecciated cherts and limestones, are the porous dolomites. The ores are "disseminated" through particular beds in place of being formed in irregular brecciated zones or into "runs" along underground channels filled with debris. The

*Mining engineer, Des Moines, Iowa.

profile of the Grand Falls chert would then answer, with no essential modification, for a generalized cross-section of the Southeastern Lead field. Only the surface in the Southeast would be an unconformity-surface instead of a warped stratigraphic plane.

Throughout the entire Ozark region the locus of strictly vadose ore deposition thus appears to be wholly dependent upon local and definite geologic structures.

The Institution of Mining and Metallurgy

SPECIAL CORRESPONDENCE

The annual general meeting of the Institution of Mining and Metallurgy was held recently, when a report of the council for the past year was read, together with an address from the incoming president, Edgar Taylor. The report of the council records a satisfactory year. The membership at the close of the year 1908 was 1799, as compared with 1625 at the corresponding date in 1907, there being, therefore, a net increase in the roll of 174 members. The principal award of the institution, the gold medal, was awarded to Dr. James Douglas, in recognition of his services in the advancement of the educational, technical and commercial interests of mining and metallurgy, and of his contributions to technical literature. Previous recipients of this award, which is the highest honor the institution confers, have been John Stewart Macarthur in 1902, Hennen Jennings in 1903, Prof. Hilary Bauerman in 1906, and Sir Archibald Geikie in 1907. Regret was expressed that Doctor Douglas was not able to be present to receive the award in person. It was remarkable that not one of the recipients of medals or prizes was present—a circumstance indicative of the world-wide activity of the members of the profession.

The gold medal presented annually by the Consolidated Goldfields of South Africa was awarded to H. L. Wilkinson, of Melbourne, Australia, for his paper on the "Deep Leads of Victoria, or the Cainozoic Buried Auriferous River Deposits."

The institution takes great interest in educational work, giving several post-graduate scholarships as well as arranging post graduate courses on some of the principal mines of the world for selected students of the leading mining schools. As many as 16 post-graduate courses were arranged during the year, of which eight were on South African mines, two on Indian mines, four on Australian mines, one at the Tomboy, Colorado, and one at the Ouro Preto in Brazil.

With a view to keeping the colonial members and those who live in foreign countries in closer touch with the work and aims of the institution, the council has

been enlarged by electing a number of members living abroad under the title of corresponding members of council.

The presidential address of Edgar Taylor, a member of the well known firm of John Taylor & Sons, was devoted to describing the advances that have been made in recent times in the methods of mining, touching principally on the work below ground. Mr. Taylor called attention to the fact that the papers read at the meetings hardly did justice to this branch of mining work, and expressed the hope that in the coming session papers would be forthcoming, describing the mining methods and equipment on some deep and up-to-date mine. He wound up an interesting address by reminding the members that, while mining was to some extent a speculative business and would on that account always continue to attract capital, it was the duty of professional mining engineers to reduce the speculative element as much as possible "and to make Nature disgorge her wealth at the least possible expense, and with the utmost benefit to the treasure seekers by adapting to the best advantage the most scientific methods and the most skilful appliances placed at their disposal by the ingenuity of man for the attainment of that object."

The Delaware & Hudson Company

This company owns and operates an extensive estate in the anthracite coal region of Pennsylvania. It also owns a system of railroads extending from its coal properties eastward and northward to the Hudson river at Albany and Rondout, and northward into Cana. Unlike most of the anthracite carriers, the company operates its coal mines directly and not through a subsidiary corporation. The report is for the calendar year 1908.

The coal statement for the year is as follows, in long tons:

	1907.	1908.	Changes.
Coal on hand Jan. 1.	141,645	374,984	I. 233,339
Coal mined.....	6,623,508	6,526,871	D. 96,637
Coal bought.....	382,478	287,329	D. 95,149
Total.....	7,147,631	7,189,184	I. 41,553
Coal sold.....	6,772,647	6,835,402	I. 62,755
On hand, Dec. 31.	374,984	353,782	D. 21,202

The earnings of the company's railroad lines from the transportation of coal in 1908 were \$9,081,664, or 45 per cent. of the total.

The relief fund for the benefit of employees of the coal department shows receipts of \$10,443. The benefits paid were \$17,828, and the balance at the close of the year \$2782. The company contributed \$8725 of the receipts.

The earnings and expenses of the Coal Department were as follows:

	1907	1908.	Changes.
Gross earnings.	\$23,184,766	\$23,847,117	I. \$662,351
Expenses.	22,227,284	22,994,000	I. 766,716
Net earnings.	\$ 957,482	\$ 853,117	D. \$104,365

Expenses include taxes, which were \$292,302 in 1908. The expenses were 95.9 per cent. of gross earnings in 1907, and 96.4 in 1908. The gross earnings in 1908 were \$3.49, and the net earnings \$0.125 per ton of coal sold, against \$3.42 and \$0.141 in the previous year.

The report says: "The collieries and washeries of the company were operated to their full capacity throughout the year, producing 6,526,871 tons of anthracite coal out of a total of 64,665,914 produced in the region. At the close of the year there were in the several storage plants 353,782 tons. The Coal Department expenses include construction and betterments amounting to \$650,283. Taxes of the Coal Department for the year 1908 show an increase of \$76,578.

"The earnings from coal freight traffic show a slight increase, due to the placing by the company of an increased tonnage of its coal in markets securing to its railroad lines a longer haul. . . .

"Early last year an amicable arrangement was made between the United States Attorney General and the anthracite coal-carrier corporations to test the constitutionality of the so-called Commodity clause of the Hepburn act, amending the Interstate Commerce act passed July 20, 1906, which statute attempted to forbid railroad corporations from transporting in interstate commerce any commodity mined, produced or owned by such carrier corporation, or in which it had any interest direct or indirect. In September last the statute in question was declared invalid by the United States Circuit Court for the Eastern District of Pennsylvania. From this decision an appeal was taken by the Attorney General to the United States Supreme Court, which appeal has been argued and is still under advisement by the court."

A discovery of the tungsten-bearing mineral scheelite in the western part of the Moose river gold district of Nova Scotia is described in the *Report of the Department of Mines* for 1908. The mineral first found was tungstite, or tungstic ochre, in the shape of a boulder. Scheelite float was found in a nearby brook and investigation displayed a belt 200 by 1200 ft. containing in all 14 veins with an aggregate width of about 50 in. Three other tungsten discoveries have been made previously in the province.

Mexican mint reports for the fiscal year, 1907-8 in the *Boletín de Estadística*, Aug., 1908, show the following: The amount of metal used for coinage was 16,497,978.38 pesos in gold, and 5,834,230.10 in silver; the export was valued as 19,896,879.62 pesos in gold, and 66,545,525 in silver. The sum total reported at the mint during the year was valued at 108,684,613.45 pesos.

THE ENGINEERING AND MINING JOURNAL

Issued Weekly by the

Hill Publishing Company

JOHN A. HILL, Pres. and Treas. ROBERT McKRAN, Sec'y.
505 Pearl St., New York.
London Office: 6 Boulevard Street, London, E. C. Eng.
CABLE ADDRESS "ENGINJOUR, N. Y."

Subscription, payable in advance, \$5.00 a year of 52 numbers, including postage in the United States, Mexico, Cuba, Porto Rico, Hawaii or the Philippines. \$6.50 in Canada.

To foreign Countries, including postage, \$8.00 or its equivalent, 33 shillings; 33 marks; or 40 francs. Notice to discontinue should be written to the New York office in every instance.

Advertising copy should reach New York office by Thursday, a week before date of issue.

For sale by all newsdealers generally.

Entered at New York Post Office as mail matter of the second class.

CIRCULATION STATEMENT

During 1908 we printed and circulated 507,500 copies of THE ENGINEERING AND MINING JOURNAL.

Our circulation for March, 1909, was 42,000 copies.

April 3, ...	13,000
April 10, ...	10,000
April 17, ...	10,000
April 24, ...	10,000

None sent free regularly, no back numbers. Figures are live, net circulation.

The Porphyry Copper Mines

During the last four or five years the mines of copper disseminated in porphyry have been amply discussed. Their fruition has been slow because they have been developed on an unparalleled scale. However, some of them have now become productive, one of them is paying dividends, and we can begin to see more clearly how the estimates are going to be borne out. In the first place let us call attention to the fallacy of referring to these as "low-grade mines." As compared to a mine like the Poderosa, that we mentioned recently, which yields ore of 30 per cent. copper, they are indeed of low grade, but as compared to those of Lake Superior they average well. Their ore is capable of cheap mining; the first metallurgic process to which they are subject, viz., milling, is the cheapest of all methods of treatment, and when their mineral undergoes the more costly smelting, the bulk has been so greatly reduced that the cost referred to the crude ore is not very much. The real low-grade mines are those like the Granby, whereof all the ore must be smelted.

Of the porphyry mines that have reached the productive stage, Nevada Consolidated is the shining light. With respect to grade of the ore, facility of mining, excellence in concentration, and performance of the smelter it appears that the engineering estimates are going to be verified, including that of a production-cost of 7c. per lb. (direct-operating expense). Its neighbor, Cumberland-Ely, is also doing well, but has so much smaller ore reserves that it can hardly be considered in the same class.

At Bingham, the Utah Copper Company has become a large producer, already paying dividends, which will doubtless be increased even at the present price for copper. This company is certainly to be pronounced a success. Its management has always been conservative in its public expression of expectations and what it has indicated has been approximately achieved. Yet, it has probably fallen a little bit short of what was really expected; not as to tonnage of ore, but rather as to cost of production. However, the Utah Copper Company is unquestionably a cheap and profitable producer.

The Boston Consolidated has been greatly disappointed as to the grade of its

ore and consequently the cost of production, besides by the beginning of steam-shovel mining at a place where the ore was unexpectedly high in iron. In order to supply the mill it became necessary on the spur of the moment to develop an underground mine. The feat of its management in opening such a mine in a few months so as to produce a large tonnage of ore was a marvel. The Boston Consolidated is a large property, which has a great tonnage of ore of about 1.5 per cent. copper, but it is now estimated that the cost of production will be 10½c. per pound.

Porphyry mines have become the fashion, as witness the numerous recent flotations. To mention some of them there is the Ohio (nearing the productive stage), the Miami (a wonderful development), the Giroux, the Ray Consolidated and adjoining it the Ray Central, and latest of all the Inspiration (near the Miami). In Chile there is the Braden Copper Company. It will be several years before all of these become productive, but sooner or later they are undoubtedly going to swell the production of copper.

The Conservation of Resources

The addresses at the recent meeting of the four engineering societies ought to dispel some of the illusions as to what may be done in the way of conserving our natural resources. Instead of statesmen, writers and dreamers, we had there a gathering of practical engineers. Dr. Douglas effectively punctured the idea that we are wasting our mineral resources by careless mining and smelting, which some conservation commission or amiable bureaucracy is going to show us how to correct. Dr. Raymond with his characteristic pungency pointed out the dangers of legislative conservation, the tendency of governmental agencies to seek additional power, and the bad record of the Federal Government in some things of this character that it has undertaken. Mr. Baker, editor of *Engineering News*, talked with real sense when he pointed out our enormous fire loss as a waste that can and ought to be reduced. This is on the line the JOURNAL has previously argued.

Attention should first of all be directed to make the best use of, and prevent the waste of, property that has been created. Let the propaganda be directed to reduc-

ing the waste by fire, vermin, disease, accidents and general carelessness. The Government itself has an excellent opportunity to lead and show the way by reducing extravagances in its own affairs. Among minor matters it might cease undertaking to teach us how to gasify coal, operate gas engines and burn coal under boilers without smoke, and otherwise multiplying unnecessarily the standard, but long existing, literature of engineering. The matter of economy in production may safely be left to the engineers of the country. Government officials can no more show them how to improve their methods of mining and smelting, extracting coal, etc., than they can teach their grandmothers to suck eggs. However, the movement toward conservation serves a real purpose, that we belittle in no way, by calling the attention of the public to the fact that it is wasteful and that our natural resources are not unlimited.

The Ultimate Consumer

We have been hearing a good deal lately about the "ultimate consumer." The phrase appears to have caught the popular fancy. The ultimate consumer is a good person to hear in mind, but there seems to be more or less doubt as to his connection with the markets. Some seem to think that the only interest of the ultimate consumer is in the prices of such things as he purchases directly, such as tea and coffee and articles of wearing apparel.

It is far from easy to trace to the ultimate consumer the consumption of such an article as copper, which may be sold in the first place to a hydroelectric company. However, no matter how tangled the skein may be, it is certain that in the end the ultimate consumer foots the bill for every article of consumption and that all the revenue that supports our Government, and builds a Panama canal, and carries on other improvements, eventually comes out of his pocket. The ultimate consumer may fancy that he has little or no concern as to a rise in price for a crude staple, like rubber for example, but nevertheless, it affects him sooner or later. Thus, as to rubber, the price of over-shoes may remain the same, but the manufacturer will coat them less thickly with gum, they will then wear less long, and in the long run the ultimate consumer

will have to buy more of them, which will be an increase in his cost of living.

The Tennessee Purchase

At the annual meeting of the United States Steel Corporation this week, a stockholder brought up in a critical way the purchase of the stock of the Tennessee Coal, Iron and Railroad Company by the Steel Corporation. His criticism was not based upon the policy of acquiring that property, but rather on the point that in doing so the Corporation might be held to have subjected itself to penalties under the Sherman law. This was doubtless inspired by the recent discussions in the United States Senate over the transaction in question, and the action of Mr. Roosevelt in intimating that no attempt would be made to apply that law to this individual case. The report of the Senate committee, which was doubtless prepared chiefly with an eye to political effect, was the moving point.

In his answer to the criticisms in question, Judge Gary stated practically nothing new, unless we may accept as news the statement that the Steel Corporation had been considering such a purchase for some time before it actually took place. That, however, is simply a confirmation of what was previously general report and understanding. Few who had anything approaching to knowledge of the conditions doubted that the ownership of the Tennessee property would eventually gravitate to the Steel Corporation. Doubtless the transaction would have been delayed for some time, had not financial conditions presented the opportunity which they did for the sudden closing of the business.

Judge Gary, in speaking of the transaction, sought to minimize its importance. He stated that it added only $2\frac{1}{2}$ per cent. to the capacity of the Corporation for producing finished steel. This is doubtless true, since the steel output of the Tennessee company had attained only to a small proportion of its total business and was comparatively a new part of that business, but it added largely to the capacity for producing pig iron and at a low rate. The main point in the transaction, however—as was remarked at the time it took place—was the acquisition of the very large reserves of iron ore which were controlled by the company. The Tennessee managers for years had followed the policy of acquiring such re-

serves, partly in provision for their estimated future needs and partly also to anticipate and prevent the successful organization of a rival company in its own territory. This policy has been successfully carried out, and it was so much in line with that of the Steel Corporation that the opportunity was one not to be neglected. The ore deposits of Alabama are by far the largest existing anywhere outside of the Lake Superior region, and their control prevents the future organization of a strong rival in Southern territory. Doubtless a great industry will in time be built up in Birmingham, as the demand which can be conveniently supplied from that center increases. It will, however, be supplementary to and controlled by the Steel Corporation. At present the Gary plant is the center of new activities and probably Birmingham will have to wait.

THE PRICE PAID for the Raritan refinery by the International Smelting and Refining Company was \$6,500,000, part in cash, part in stock. The capacity of the works is 300,000,000 lb. of copper per annum. The cost of building such a works is about \$2,250,000, exclusive of the land, which at Perth Amboy is fairly expensive. It is fair to say in this case that \$4,000,000 represented profitable contracts, good will, etc. The earning capacity of the works is said to be \$1,000,000 per annum, but that seems to be putting it rather high.

THERE ARE MANY mining districts in which water is a costly commodity, where careful means have to be introduced to economize it. One of these is Broken Hill, New South Wales. The article by Mr. Palmer, elsewhere in this issue, gives some remarkable figures respecting small water consumption in mining and milling. At the Junction North mine he has reduced the quantity to 1000 lb. per 2240 lb. of ore, and expects to get down to 950 lb. of water per 2240 lb. of ore.

REPORTS ARE NOW becoming more frequent of copper mines that are being closed to make necessary repairs, or are letting a part of their furnaces go out of blast "while copper continues so low," etc. This manifests the beginning of a natural restriction of production by the elimination of those mines whose cost has been proved to be higher than 13c. per lb. of copper, with little or no prospect of farther economy.

Mining Laws and Lease System in Wisconsin Zinc District

By J. E. KENNEDY*

Mining legislation enacted in Wisconsin is decidedly meager. The only laws in the statutes today regulating mining were passed in 1860 and in 1872, when lead ore was practically the only "mineral" mined in the State. Any general terms specifying the number of men required to work, the number of days of work required per year and the amount of rent to be paid to the landowner constitute a good lease. A verbal lease is equally as binding as a written one, which is an exception to the general law that any transfer of interest in land shall be void unless in writing. Furthermore, a verbal lease as well as a written one is transferable to third parties, an instance of which occurred recently at Mifflin, Wis. In the absence of a written lease, the usages and customs among miners govern and the taking of rent by the landowner constitutes renewal of lease. In the State of Illinois, however, a verbal lease is not binding, as was decided a few years ago by a test case.

RULES GOVERNING MINING RIGHTS

The Wisconsin law of 1860 declares that, when there is no contract between the parties or terms established by the landlord to the contrary, the following rules and regulations apply to mining contracts and leases for the digging of ores and minerals:

"(1) No license or lease, verbal or written, made to a miner shall be revocable by the maker thereof after a valuable discovery or prospect has been struck unless the miner shall forfeit his right by negligence such as establishes a forfeiture according to mining usages.

"(2) The discovery of a crevice or range containing ores or minerals shall entitle the discoverer of the ores or minerals pertaining thereto, subject to the rent due his landlord, before as well as after the ores or minerals are separated from the freehold; but such miner shall not be entitled to recover any ores or minerals or the value thereof from a person digging on his range in good faith and known to be mining thereon until he shall have given notice of his claim; and he shall be entitled to the ores or minerals dug after such notice.

"(3) Usages and customs among miners may be proved in explanation of mining contracts to the same extent as usage may be proved in other branches of business."

In the case of *Sobey vs. Thomas*, 39 *Wis.* 317, it was declared that "the statutes governing the rights of miners ap-

ply only when there is no contract fixing the rights of the parties." Decision in the case cited also declared that "lease of exclusive right to work a certain range does not convey the exclusive right to work a vein on another portion of said tract, between which and the former no connection exists within the said tract, although, since the lease, a connection between them has been traced by a circuitous course through adjacent land of another person."

CONFLICTING CLAIMS

In case of conflicting claims, the Wisconsin statutes provide the court with authority to "continue any action to enforce a claim or grant any necessary time for the purpose of allowing parties to prove up their mines or diggings," in which case the court may appoint a receiver to whom the ores or minerals raised by either party, pending the dispute, shall be delivered, such receiver paying any rent or other necessary expenses therefrom. This law aimed to correct claim-jumping, a common practice in the early days of lead mining. The custom prevailed that the right to mine a certain tract, crevice or range was retained, in the absence of the miner himself, by the presence of his windlass. The claim-jumper had only to substitute his own windlass and display greater physical prowess in order to displace the proper owner.

"A license to mine upon lands is irrevocable after a valuable discovery or prospect has been struck by the licensee, though no actual entry has been made under the lease." *Tipping vs. Robbins*, 64 *Wis.* 546. Thus, if *A* has obtained license to mine the adjoining lands of *B* and *C* and has made a valuable discovery on the land of *B* his license to mine upon the land of *C* cannot be revoked by *C*.

"A written conveyance of the right to dig for ore on a certain described range does not create a property or estate in the land; it is a mere license to dig and search for the mineral." *Gillett vs. Treganza*, 6 *Wis.* 342. Therefore, *A* has no interest in ores mined by *B* after *A* has forfeited his rights according to the provisions of his lease or according to the usages and customs among miners.

LESSEE'S FRAUD—FORFEITURE OF RIGHTS

"Any miner who shall conceal or dispose of any ores or minerals for the purpose of defrauding his lessor of his rent or who shall neglect to pay any rent on ores or minerals raised by him for three days after the notice thereof and claim of such rent, shall forfeit all right to his mines, diggings or range; and his landlord, after such concealment or after three days have expired from the time of demanding rent, may proceed against him to recover possession of the mines or diggings before a justice of the peace as in the case of a tenant holding over after

the termination of his lease as provided by these statutes; and in case a miner shall neglect to work his mines or diggings according to the usages of miners, without reasonable excuse, he shall likewise forfeit his mines or diggings and his landlord may proceed against him in like manner to recover possession of the same." *Wis. Stat.* 1860 *Sec. 5 ch. 260* and 1872 *sec. 4 ch. 117*.

RIGHT OF WATERWAY

Sections 1650-53 of the Revised Statutes of Wisconsin grant the right to every corporation, company or person engaged in mining to conduct water away from their shafts or levels, over or below the surface of the land of adjoining landowners. Commissioners are to be appointed whenever the parties in dispute cannot agree as to damages. Appeal may be taken from decision of commissioners to the Circuit Court and land may be taken after the award has been allowed and filed.

SAFETY RESTRICTIONS

No laws regulating mining methods nor aiming to secure greater safety are in force in Wisconsin. A bill creating the office of mine inspector was introduced in the legislature at Madison four years ago, but failed to become a law.

GENERAL PROVISIONS OF LEASES

There are only one or two instances where verbal leases are in force in Wisconsin at the present time. The ordinary written lease is permanent provided certain conditions are fulfilled by the lessee. The customary rent or royalty paid today in the Wisconsin zinc district is one-tenth of the gross receipts from ores mined. A few leases require one-ninth and a limited number require only one-twelfth. The usual rent paid for lead diggings in the early days was one-eighth; often, however, a provision was made to the effect that one-eighth rent be paid on ore found above water and one-tenth on that found below the water level. A few leases today require one-eighth rent to be paid on lead and one-tenth on zinc ore. Except in one or two instances the lessee pays the cost of hauling of ore to railway, ore buyers in this district usually purchasing the ore f.o.b. cars. It is the exception, rather than the rule, that a cash bonus is paid to landowners to obtain a lease. Most of the leases in force require the lessee to work at least four men nine months or more each year.

According to the *Torg. Prom Gazetta*, there were 64 dredges at work in the Urals and the Yenisseik district, Russia, in 1908. Of these 25 were in the Urals. Fairly detailed reports have been received of the working of 46 of the dredges, the production of which was 52,467 oz. of gold.

Comments on Questions Arising in Technical Practice and
Debatable Points Suggested by Articles in the Journal

CORRESPONDENCE AND DISCUSSION

Sampling by Machine

I have read with interest the recent articles in the JOURNAL under the above heading and note that the opinion seems to prevail that our present methods and machines either are not absolutely reliable or that mill men have not yet made sufficiently accurate experiments to teach them definitely whether the methods or machines or both are at fault.

The greatest inaccuracies are liable to occur in the coarsest sizes. The reasons for this are clearly stated by Mr. Church. (1) An inherent defect in all automatic, mechanical sampling machines treating mixed coarse and fine ore due to the fact that as the sampler scoop comes under the stream of ore a certain period of time ensues before there is sufficient opening, between the near side of the sampling scoop and the far side of the ore spout, for the coarse ore to pass into the scoop, and when the scoop is passing out of the ore stream the diminishing space between the far side of the scoop and the near side of the ore spout also prevents the coarse ore from entering the sampler, yet fine ore is passing into the scoop during the whole period; (2) the ore in sliding down chutes or passing through the samplers is retarded but this retardation is not the same on fines and coarse so that there is a tendency for the two to separate and introduce another error.

These two arguments seem logical and appear to prove that in sampling ores where the coarse and fine sizes are liable to carry different values, we cannot be certain that the sample obtained is representative of the lot of ore handled. The remedies so far proposed deal with the method of taking the sample, the frequency of cut and the proper handling between machines; but it seems to me that the greatest error is due to the construction of the sampling machines now on the market, and the discussion of a new design might lead to the result we are trying to obtain.

Some time ago I was called upon to design a concentrating plant for the separation of stibnite from a quartz and slate gangue. Owing to the greater brittleness and softness of the stibnite compared with the quartz, the fine ore had a much higher mineral content than the coarse material. The first crushing was to $2\frac{1}{2}$ in. and the sampling would have to be done after this crushing. Realizing the inaccuracies which were liable to obtain with any of

the samplers then on the market due to the first reason above mentioned I set out to design a new machine. My efforts resulted in a very simple machine. The idea is so simple that possibly it may have been used before but as far as I know it is original.

The machine consists of two endless sprocket chains carried on sprocket wheels. On these chains are carried one or more buckets attached to the chain as is usual on steel-pan conveyers. These buckets, which it should be remembered are few in number, can be dumped at any point by means of a tripper. On the return or under side of the conveyer the bucket is inverted so that material spilling from above could not enter and vitiate the sample. The buckets can be of sufficient capacity to suit the plant, but are made a little larger than necessary so as to prevent spilling. By varying the speed of travel of the chain and the number of buckets the proper frequency of cut can be obtained.

The travel of the buckets is in the same direction as the flow of the ore in the ore chute above it. The buckets are made wider than the ore chute to prevent the ore spilling. On the front of the bucket is a hinged lip extending the width of the bucket and $\frac{1}{2}$ in. longer than the largest size. As the travel of the chain brings the bucket under the ore spout two flat guides engage the lip and force it down against the top of the bucket, putting two springs in compression and forming a cover over the front of the bucket for a distance of 3 in. in its length and its entire width. The guides stop at the end of the ore spout.

As the front of the bucket passes the end of the ore chute into the ore stream, the lip forms a flat extension of the bottom of the ore chute until released from the guides, when it is instantly forced into an almost vertical position and the stream of ore flows into the bucket. The lip helps to prevent spilling. It is readily apparent that both coarse and fine will be caught by the bucket in the same proportion as they existed in the ore stream. It is also apparent that as the bucket leaves the ore stream it will cut coarse and fine alike.

The sample is held compactly in the bucket and can be delivered into an ore bin by a very short spout. This would eliminate the distance the ore has to fall through such samples as the Vezin or Snyder, and the overturning of the bucket would mix coarse and fine so thoroughly that they could not separate in the short

space to the ore bin or next crusher. The effect of retardation would, therefore, be of little importance.

This device need take up no more headroom than other samplers, would take no more power, has the advantage of cheaper first cost and the chain can be of any length desired, transporting the sample to any convenient place for further treatment. The device is not patented and I offer it for discussion.

Direct vs. Alternating Current for Mine Work

In the JOURNAL of March 6, 1909, there is an abstract of a paper on "The Use of Electricity as Applied to Coal Mining," by W. B. Spellmire, of the Allis-Chalmers Company, in which, among other matters, the question of direct vs. alternating currents for mining work is discussed. Mr. Spellmire appears to be of the opinion that alternating currents are to have it all their own way in mining work. I think there is considerable doubt as to that. It is quite true that for some time past three-phase alternating currents have been making steady way in mines, for two reasons: the absence of the commutator necessary with continuous-current motors, and the greater ease with which large quantities of power can be transmitted over long distances.

During the last 30 years, which really covers the period of the practical application of electricity to general commercial life, the alternating current has had a checkered career. During at least two important portions of that period, the alternating current has apparently been the form of electricity that was applicable to anything and everything, and then shortly afterward the alternating current has been in disgrace and risen again, Phenix-like, a short time later.

I think the later and more important development of the use of alternating current is due to America and the great use that has been made there of very high pressures to deliver large quantities of power over long distances. On this side, when we installed electric trams many years after you had had them running, we followed your lead exactly in pressure and everything else. There are signs, however, that the continuous current may recover its position. M. Thury has been working

quietly at Geneva and has done much useful work with continuous currents at very high pressures. He has constructed a continuous-current machine to work at 25,000 volts.

M. Thury has returned to the arrangement that was suggested for long-distance transmission in the very early days of electricity, viz., the connecting of generators in series, instead of in parallel. In this method additional power is obtained when required by connecting additional machines in series. On light load under this system one generator, for example, will be running, and as more power is required, the single machine running may be speeded up until it is at its maximum. Then a second machine is switched into the circuit and adds its pressure, which again may be low at first and gradually increased as the demand for power increases. This may be followed by a third machine, and so on.

Consumption is supplied in exactly the same way, by switching motors into the circuit, instead of switching them across the circuit. The arrangement, of course, requires some knowledge and experience, but with the general spread of knowledge of electricity this should not be a serious matter. Any kind of power, for any purpose, can be obtained at any part of a mine, for instance, by switching in a motor and causing it to drive a generator that furnishes the current in the required form. Where the motor can be applied to perform the actual work itself it is switched in and the pressure it is taking regulated, instead of the current.

This arrangement has several important advantages. One is that it requires only two cables instead of three, as required with three-phase apparatus which constitute the greater number of alternating-current power plants. There is also avoided the troublesome conditions that arise with alternating currents owing to the development and changes of magnetism in the neighborhood of the cables. I think it would be at least as simple when once the arrangement is understood, to work in mines with continuous currents on these lines as with the parallel system.

I note also that Mr. Spellmire states that direct-current generators cannot be built to operate at higher than 600 volts. On this side continuous-current generators have already been built up to 3000 volts, and I think if a sufficient demand arose, with improved methods of manufacture, improved materials of insulation, etc., higher voltages could be obtained. The great trouble in producing either continuous-current generators, or continuous-current motors at high pressures is the insulation of the commutator. With high pressures the commutator assumes very large proportions and the insulation becomes a serious matter.

Bath, England, April 8, 1909.

Collecting Precious Metal Dust

Various means have been devised for collecting or reclaiming the precious metal dust in mills where the ores are crushed dry and a description of the accompanying illustration may, therefore, be of interest to those engaged in this particular branch of metallurgical work. In the illustration, *A* represents one of the fans exhausting the dust from the mill or elsewhere, and discharging the same through pipes to the air separator *B*.

The heavier portion as it enters this separator drops to the bottom and then spouts to the proper machine for further treatment. The separator *B*, does its work satisfactorily as far as it goes, but only takes care of the coarser and heavier particles and without further apparatus much valuable dust would go to waste. The dust collected in *B* contains some of

D, to make a wet pulp that will easily run to the table or vanner floor. To be sure that none of the valuable dust escapes with the surplus air at the outlet *X*, a sheet-iron spiral *S*, is installed as shown in the illustration. Above this spiral is also another spraying nozzle. These spray nozzles and dust collectors are manufactured by the Schutte & Koerting Company, of Philadelphia, Penn.

Coal Mining as an Investment

The editorial on "Coal Mining as an Investment" in the JOURNAL of March 27, 1909, was read with great pleasure because the public has been served with articles in the magazines, such as the *World's Work*, etc., warning them that a mining investment is purely speculative and, therefore, unsafe; that on investment that

The Engineering & Mining Journal, N. Y.

COLLECTOR FOR PRECIOUS METAL DUST

the richest portions of the ore, occasionally weighing as much as 135 lb. per cubic foot.

The dust collector proper is made of metals suitable to the requirements and is equipped with a number of spray nozzles of special construction through which water under about 50 pounds pressure is forced. The ore dust is forced in by the blower and enters at *E*. In passing up and down the different compartments it is moistened by the water discharged through the spray nozzles, which contain a spiral that gives the water a rotary motion. This has the effect that on entering, the water is thrown into a very fine spray which completely fills the different dust collector pipes in which nozzles are installed and as the dust passes through the spray, it is collected and drops to the bottom whence it is flushed to the sealed tank *D*.

When this material is to be subsequently concentrated on vannors or tables, sufficient water is added in the steel tank

pays more than 5 or 6 per cent. per annum is a safe investment.

In a section like the South, where opportunities are many and capital scarce, the rate of interest paid by many legitimate and perfectly safe investments is much higher than 5 or 6 per cent., and the business of mining when properly conducted will pay at least 20 per cent. upon the investment.

It will not be long until even in this section coal land will be so high in price that it will be impossible to buy it without, in a large measure, discounting the future, but to those who have bought or will buy now the investment should be very attractive, and to those who undertake this problem in an intelligent way, namely, by obtaining competent advice and assistance, there need be no risk at all in the undertaking of mining coal.

Chattanooga, Tenn., April 12, 1909.

Mining Conditions in Turkey

SPECIAL CORRESPONDENCE

The momentous political change that has recently taken place in Turkey invites attention to the mineral resources of that country, which, in spite of their acknowledged abundance, have in the past been but poorly exploited. Corrupt officialdom, unfavorable mining laws and the absence of roads have all contributed to prevent mining from becoming a prosperous industry. Except at mines situated near the coast, the necessary machinery for working could not be installed, owing to transport difficulties. The introduction of electrical machinery has been prohibited, except under very special circumstances, while the admission of explosives has always been a matter of the greatest difficulty and expense. Under these conditions it is not to be wondered at that capitalists have been shy of investing in mining undertakings.

Under the altered form of government reforms may be looked for which cannot fail to lead to a rapid development of the country's minerals. Regular and reliable statistics of the mineral production are unfortunately not available. In Cuinet's great work there is much valuable information, but the book is somewhat out of date. From time to time British consular reports have described the mines of certain districts. One of the most important of these is that published in 1903, entitled, "Mining Industries and Forestry in Turkey," which deals with the districts of Smyrna, Aleppo, Damascus, Beyrout and the Lebanon, Adana, Erzerum, Trebizond and Uskub. The general tone of these reports is pessimistic, and little encouragement is given to capitalists to take up mines, owing to the unfavorable conditions prevailing. As an example of these reports, that by Consul Barnham, upon the mines of the Aleppo Vilayet, may be quoted: "It is no grateful task," he says, to write of mines and mining operations in this district, for although the mineral wealth is great, I do not remember that any concession worth mentioning has even been granted.

. . . The minerals of which the locality is more or less defined are coal, iron, silver, copper, chrome ore, boracite, antimony, sulphur, fuller's earth and petroleum."

At one of the iron mines in his district the ore was carried on horseback, a day's journey, to be smelted at a place where timber was available, in spite of the fact that there was an occurrence of coal in the immediate neighborhood of the mine.

A RICH DISTRICT

Another consular report, that by the British consul at Uskub in Macedonia, quoted in Noll Buxton's paper, "Balkan

Geography and Balkan Railways," in the September number of the Royal Geographical Society's *Journal* of this year, is written in the same strain. He says: "The province of Kossovo possesses all the latent possibilities of very real prosperity, but political conditions at present frighten capitalists and paralyze industry. There are mines of every description in the province and the mineral wealth is said to be comparable with that of the Transvaal, but owing to the great difficulties of transport and the insecurity of the country, few mines have been exploited up to the present, but concessions are now being more eagerly sought after. Gold, silver, copper, iron, chrome ore, lead, antimony and manganese, besides coal (lignite) have all been found in considerable quantities and fresh discoveries of lodes are continually being made. A British company will this year start working a silver-lead mine near Kratova, which is believed to have very good prospects; it was worked by the ancient Greeks and is one of the mines mentioned by Herodotus. The chrome mines near Kalkandelen cannot yet enter into competition with the New Caledonian chrome mines, owing to the excessively costly transport of the mineral to the coast. Coal mines are plentiful, as at Kalkandelen, Prisen, Yeniky, etc., but the quality does not appear to be very satisfactory."

NO DEPARTMENT OF MINES

One reason for the general ignorance and uncertainty as to the extent of the mineral resources is that there is no government geological survey. That the country contains many valuable mineral deposits is, however, indisputable. There have been considerable exports of chrome iron ore, of emery and of borax, while antimony, copper, lead, coal and manganese have also been produced on a smaller scale. As regards the mining law, mining concessions are held either under an Imperial concession or *firman*, or under a prospecting license. The formalities necessary for obtaining a *firman* are very severe, and as it is only with this title that the rights to a mining property are secure, it is not surprising that capitalists have avoided the country.

A report by the German Consul General at Constantinople, published in the *Oesterreichische Monatschrift für der Orient*, May, 1905, "Das Minenwesen in der Türkei," contains some interesting criticism, mostly of an unfavorable character, on the mining law of Turkey, and gives reasons for the backward condition of the mining industry.

Whether the new regime will alter all this remains to be seen. There cannot, however, be any doubt that under a liberal and well administered mining law, capital for developing mineral property in Turkey would flow into the country to

the great advantage of the national finances. Taking into consideration the urgent need there is of increased revenue, it seems scarcely possible that this most promising method of strengthening the finances will be neglected. A point in favor of the expansion of mining enterprise is the railway development that has taken place in recent times, both in European and Asiatic Turkey. The country is rapidly becoming more accessible and the work of exploration much simplified. Security of tenure and the removal of official obstruction are the principal needs of the country to encourage mining enterprise. What is required is the formation of a strong department of mines, with a competent staff of mining engineers; and what is now a neglected industry, may soon become of great commercial importance.

A Proposed Blast Furnace

Joseph E. Johnson, Longdale, Va., proposes (U. S. patent 906,717, Dec. 15, 1908) a blast furnace having at the top of the stack above the ore hopper a mantle

The Engineering & Mining Journal, N.Y.

THE JOHNSON BLAST FURNACE

carrying a conical fuel hopper ending in a vertical cylindrical chute flaring at the bottom and designed to feed the coke or fuel separate from the stock and to have it descend in a column inside of that formed by the stock. Above the mantle and fuel hopper is mounted a steam cylinder with a pusher which fits into the cylindrical body of the fuel chute, and presses on the upper surface of the fuel. The lower portion of the fuel chute is a frustum of a fluted cone whereby the fuel is discharged in a column having flutes within the body of the ore or stock.

The *Queen, Geo. Min. Journ.* places the total gold output of New South Wales to the end of 1908 at 13,258,793 oz. fine. The yield recorded for 1908 was 223,792 ounces.

Patents Relating To Mining and Metallurgy

A Selected and Classified List of New Inventions Described during the Past Month in the Publications of the Patent Offices

UNITED STATES AND BRITISH PATENTS

A copy of the specifications of any of these patents issued by the United States Patent Office will be mailed by THE ENGINEERING AND MINING JOURNAL upon the receipt of 25 cents. British patents are supplied at 40 cents. In ordering specifications, correspondents are requested to give the number, name of inventor and date of issue.

ALUMINUM

CASTINGS—Mold for Making Castings of Aluminum and Aluminum Alloys. Earl Blough, Parnassus, Penn., assignor to Aluminum Company of America, Pittsburgh, Penn., a Corporation of Pennsylvania. (U. S. Nos. 915,727 and 915,728; Mar. 23, 1909.)

COAL AND COKE

COAL-CUTTING MACHINES—Improvements in, or Relating to Coal-Cutting Machines. Herbert Clough, Sheffield, and William C. Mountain, Gateshead, Eng. (Brit. No. 4966 of 1908.)

COKE—Improved Means for Preventing the Breakage of Coke Discharged from Coke-Ovens. Brodie Cochrane, Gosforth, and Robert Peel, New Brancepeth Colliery, Eng. (Brit. No. 19,280 of 1908.)

COKE-OVENS—Improvements in and Relating to the Building of Horizontal Flued Coke-Ovens. Arnold Layton, London, and Thomas H. Riley, Sheffield, Eng. (Brit. No. 826 of 1908.)

COKE-OVENS—Improvements in, or Connected with Charging Apparatus for Coke-Ovens. The Coke-Ovens, and By-Products Co., Ltd., and Stephen Newcombe, London. (Brit. No. 6224 of 1908.)

COKE-OVENS—Improvements in, or Connected with Coke-Ovens. The Coke-Ovens and By-Products Company, Ltd., and Stephen N. Wellington, London. (Brit. No. 6047 of 1908.)

COKE-OVENS—Improvements in, or Connected with Coke Ovens. Harold W. Seynour, Leeds, Eng. (Brit. No. 1409 of 1908.)

COPPER

DESULPHURIZING—Apparatus for Desulphurizing and Sintering Ores. Arthur S. Dwight, Joliet, Ill., and Richard L. Lloyd, Cananea, Mexico, assignors to Fred Bennitt, trustee, Joliet, Ill. (U. S. No. 916,395; Mar. 23, 1909.)

ROASTING—Apparatus for Roasting and Sintering Ores. Arthur S. Dwight, Joliet, Ill., and Richard L. Lloyd, New York, N. Y., assignors to Fred Bennitt, trustee, Joliet, Ill. (U. S. No. 916,394; Mar. 23, 1909.)

ROASTING—Process of Roasting and Sintering Ore. Arthur S. Dwight, Joliet, Ill., assignor to Fred Bennitt, trustee, Joliet, Ill. (U. S. Nos. 916,396 and 916,397; Mar. 23, 1909.)

GOLD AND SILVER

CYANIDATION—Improvements in Apparatus for Separating Cyanide, Alkaline and Other Solutions from Slimes, Sands and the Like. Communicated from Innes, Proctor & Hayles, Tarkwa, Gold Coast, West Africa. (Brit. No. 11,008 of 1908.)

PLACER MINING—Apparatus for Mining Gold at the Bottoms of Flowing Streams. Leader F. Gilman, Sacramento, Cal. (U. S. No. 916,859; Mar. 30, 1909.)

IRON AND STEEL

DRY-AIR BLAST—Improvements in Drying Blast for Metallurgical Furnaces. Frank W. Harbord, London. (Brit. No. 4424 of 1908.)

HARDENING AND TEMPERING—Composition of Matter to be Employed for Hardening and Tempering Steel. Barnabas J. Castellan, San Diego, Cal. (Brit. No. 3652 of 1908.)

HARDENING AND TEMPERING—Process of Hardening and Tempering Steel. Barnabas J. Castellan, San Diego, Cal. (Brit. No. 3651 of 1908.)

MANUFACTURE—Direct Process of Manufacturing Iron and Steel. Thomas J. Heslett, Brunswick, and Montague Moore, Melbourne, Victoria, Australia. (U. S. No. 917,475; Apr. 6, 1909.)

TIN

DETINNING—Process for Preparing, Smelting and Utilizing Various Products Containing Tin. Particularly the Metallic Sponge and Slime Obtained in the Electrolytic Removal of Tin from Tinplate Scrap. Hans Renneke, Rhelnau, Germany. (Brit. No. 16,428 of 1908.)

MINING—GENERAL

BLASTING—Improvements in and Relating to Blasting Fuses with Double Action. Jean Langle, Rouen, France. (Brit. No. 16,774 of 1908.)

COMPRESSING AIR—A New or Improved System of and Improvements in, or Connected with Means for Compressing Air for Use in Subterranean Mines. Samuel M. Mayor, Mile-End, Glasgow, Scotland. (Brit. No. 3038 of 1908.)

COMPRESSING AIR—Method or Process of Compressing Air. William K. Richardson, Leavenworth, Kans. (U. S. No. 916,019; Mar. 23, 1909.)

LIFTAGE—Improvements Relating to the Electrical Operation of Haulage and Winding Gear. Henry A. Mayor and Mayor & Coulson, Ltd., Mile-End, Glasgow, Scotland. (Brit. No. 1450 of 1908.)

RESCUE WORK—Improvements in Means Adapted for the Assistance of Miners Entombed in Cases of Disaster in Coal Pits, Mines and Subterranean Passages. John S. Hastie, London. (Brit. No. 6496 of 1908.)

ORE DRESSING

CONCENTRATOR—Mineral-Concentrator. Charles O. Michaelson, Omaha, Neb. (U. S. No. 917,337; April 6, 1909.)

CONCENTRATOR-TABLE SUPPORT. William L. Card and Frank S. Card, Denver, Colo. (U. S. No. 917,247; Apr. 6, 1909.)

CRUSHING—Improvements in Machines for Crushing or Disintegrating Ore and Other Substances. Frederick T. Watts, Bulawayo, Rhodesia, South Africa. (Brit. No. 12,676 of 1908.)

GRINDING MACHINERY—Improvements in Machinery for Grinding or Crushing Ore, Rock, Cement and the Like. David Honeywood and Garratt Payne, London. (Brit. No. 25,497 of 1907.)

GRINDING MACHINERY—Improvements in, or Relating to Grinding or Crushing Machinery. George Elliott and George Oxley & Sons, Sheffield, Eng. (Brit. No. 4607 of 1908.)

ORE-CONCENTRATOR. Samuel K. Behrend, Denver, Colo. (U. S. No. 916,257; Mar. 23, 1909.)

SEPARATION—Improvements in Means for Separating Comminuted Ores or Other Solid Matter from Liquids. Alexander J. Arbuckle, Belgravia, Transvaal. (Brit. No. 17,756 of 1908.)

SEPARATOR—Centrifugal Ore-Separator. Philip F. Peck, Chicago, Ill. (U. S. Nos. 917,120, 917,121, 917,122 and 917,123; Apr. 6, 1909.)

METALLURGY—GENERAL

CALCINING, DESULPHURIZING, AGGLOMERATING AND SINTERING ORES and the Like. Francis D. Weeks, Salida, Colo., assignor to Ohio and Colorado Smelting and Refining Company, New York, N. Y., a Corporation of Colorado. (U. S. No. 916,903; Mar. 30, 1909.)

MINING MACHINERY AND APPARATUS
AERIAL TRAMWAY. William S. La Shells, Berkeley, Cal., assignor to Klamath River Gold Mining Company, Bencla, Cal., a Corporation of California. (U. S. No. 916,335; Mar. 23, 1909.)

BLASTING—Electrical Shot-Firing Machine for Mines. Walter B. McLarty, Wilburton, Okla., assignor of one-half to Jeff T. Boucher, Wilburton, Okla. (U. S. No. 916,476; Mar. 30, 1909.)

BRAKING APPARATUS—Improved Construction of Apparatus for Braking or Spragging Mining Trams, Street Trams, Road and Other Vehicles. John A. Noel, Cardiff, Wales. (Brit. No. 23,155 of 1908.)

CONVEYERS—Improvements in Conveyers Specially Applicable for Transporting Coal or Other Minerals and Constructed With or Without Perforated Plates, Bars, or Grids, for Grading the Coal or Other Minerals. Cuthbert Burnett, Durham, Eng. (Brit. No. 7369 of 1908.)

MINE-CAR STOP—Automatic Mine-Car Stop. Ubel U. Carr, Pittsburg, Penn. (U. S. No. 917,540; Apr. 6, 1909.)

MINE-DOOR-OPERATING DEVICE. John M. Sausser, Osnaburg, Ohio. (U. S. No. 916,027; Mar. 23, 1909.)

PUMPS—Improvements in, or Relating to Centrifugal Pumps for Delivering Liquids. James T. Rossiter, Chiswick, Middlesex, Eng. (Brit. No. 24,499 of 1908.)

PUMPS—Improvements Relating to Rotary Pumps. Horace M. Hodgson, London and the Bryan Donkin Company, Ltd., (Chatterfield, Eng. (Brit. No. 16,098 of 1908.)

ROCK-DRILL—Internal-Combustion Rock-Drill. Lewis L. Scott, Joplin, Mo. (U. S. No. 915,893; Mar. 23, 1909.)

SAFETY APPLIANCES—Improvements in Safety Appliances for Mines. Samuel G. Bennett, Chatterfield, Eng. (Brit. No. 2889 of 1908.)

SAFETY APPLIANCES—Improvements in Safety Appliances for Removing Mine Props. Reginald Higninbottom, Thurnscoe, and Owen Murphy, Goldthorpe, Eng. (Brit. No. 6539 of 1908.)

SAFETY LAMP—An Improved Miners' Safety Lamp. Harry B. Buckley, Batley, Eng. (Brit. No. 10,371 of 1908.)

SAFETY LAMPS—Improvements in, or Connected with Miners' Safety Lamps. Harry B. Buckley, Batley, Eng. (Brit. No. 10,372 of 1908.)

SAFETY LAMPS—Improvements in, or Relating to Brushes for Cleaning the Gauzes of Miners' Safety Lamps. John C. Best, Morley, Eng. (Brit. No. 13,510 of 1908.)

SAFETY LAMPS—Novel or Improved Glasses for Miners' Safety Lamps. John T. Stobbs, Stoke-on-Trent, Eng. (Brit. No. 7546 of 1908.)

METALLURGICAL MACHINERY AND APPARATUS

FURNACES—Improvements in Furnaces. Marcus Ruthenburg, Lockport, N. Y. (Brit. No. 12,408 of 1908.)

METALLURGICAL FURNACES—Improvements in Metallurgical Furnaces. Louis S. Hughes, Joplin, Mo. (Brit. No. 16,521 of 1908.)

RABBLES—Improvements in Rabblers for Ore-Roasting Furnaces. Arthur V. Leggo, St. Kilda, Victoria, Aust. (Brit. No. 19,469 of 1908.)

RETORT FURNACE—Improvements Pertaining to the Firing of Retort or Muffle Furnaces by Means of Producer Gas. Ernst Schmatolla, Berlin. (Brit. No. 3394 of 1908.)

REVERBERATORY FURNACES—Improvements in, or Relating to Reverberatory and Like Furnaces. Communicated from Ernst Schmatolla, Berlin. (Brit. No. 3394 of 1908.)

REVERBERATORY FURNACES—Improvements in Reverberatory Smelting Furnaces. Alva D. Lee, Gila Bend, Ariz. (Brit. No. 11,259 of 1908.)

SMELTER—ORE-SMELTER. Ezra A. Mathers, Philadelphia, Penn., assignor of one-half to Daniel H. Harner, Philadelphia, Penn. (U. S. No. 916,176; Mar. 23, 1909.)

Personals

Mining and metallurgical engineers are invited to keep **THE ENGINEERING AND MINING JOURNAL** informed of their movements and appointments.

Etienne A. Ritter is examining mining properties at Red Cliff, Colorado.

A. E. Drucker is making a study of the ore treatment in the Kolar goldfield, Mysore, India.

H. T. Pemberton, general manager of the Bartlett mines, Gowganda, has gone to New York.

James B. Davies has resigned his position as superintendent of the Plymouth Coal Company.

Henry Watson, chemist and metallurgist for Goldsmith Brothers Smelting and Refining Company, has gone to Europe.

Frederick H. Morley left Denver April 15, for Prescott, Ariz., to inspect mining property in the Bradshaw mountains.

George D. Reid, of Denver, Colo., is engaged in the examination of mining properties in the Seven Devils district of Idaho.

William Henry Keller, has opened an office in Charleston, W. Va., as consulting electrical engineer in mining practice and equipment.

John B. Hobson has returned to Victoria, B. C., after having spent the winter in California. He will shortly proceed to Cariboo.

John T. Fuller, general manager of the Arkansas Diamond Company, of Little Rock and Murfreesboro, Ark., is in New York, buying machinery.

D. W. Brunton, Denver, Colo., is now in New York City on business and will sail for Europe on April 24. He expects to be absent about six weeks.

J. W. Skeele, general sales agent of the Lehigh Valley Coal Company, has been elected vice-president of the company. He will continue in charge of the sales department.

James P. Walsh has been elected vice-president of the Pittsburg Coal Company, in place of W. R. Woodford, resigned. Mr. Walsh has been connected with the company since its organization.

D. C. Thomas has resigned his position as a district general superintendent of the Pittsburg Coal Company, and has been appointed general superintendent of the United Coal Company.

Dr. Milton L. Hersey, of Montreal, has returned from Germany, where he went in connection with the sampling of 100 tons of Crown Reserve silver ore purchased by the German government.

Ivan E. Goodwin has removed from Rapid City, S. D., to Seattle, Wash., where he has opened an office, in partnership with C. E. Bogardus, for testing ores and engineering materials.

Robert H. Engle, formerly with the

Trenton Smelting and Refining Company, is now at 649 Hamilton avenue, Trenton, N. J., where he has opened an experimental laboratory.

J. A. Garcia has been appointed general superintendent of the Brazil Block Coal Company in charge of operating and engineering departments in Illinois, and the Clinton district of Indiana.

Theodore Gross has been appointed resident manager for the United States and Mexico, of the London Venture Corporation, Ltd., and will have his office in the City Investing building, 165 Broadway, New York.

Dr. W. F. King, Canadian astronomer and boundary commissioner, has left Ottawa, for Washington, to arrange with Dr. O. H. Teddman, American boundary commissioner, for the resumption of boundary survey work.

Horace G. Nichols, manager of the Ymir mine, British Columbia, has arranged to have his new slimes-treating process used in connection with the stamp mill being installed at the Jewel gold mine, Boundary district of British Columbia.

Paul S. Couldrey, who excepting during an interval spent in Western Australia, has been in charge since 1902 of the mines at Rossland, B. C., of Le Roi No. 2, Ltd., of London, has been notified by cable from London, that his services are required in another field.

Rector L. Lee, who has been in Peru during the last year, as assistant superintendent at the Peruvian Mining, Smelting and Refining Company's smelter, at Rio Blanco, has returned to the United States on account of the closing of that plant. His address will be Provo, Utah.

Obituary

George Nissen died suddenly in New York, April 15, aged 62 years. He was born in Hamburg, Germany, and came to New York in 1867. Since 1882 he had been connected with the metal trade in New York, for some years as an independent operator, and later as a member of the Pope Metals Company.

Amzi Lorenzo Barber died at Ardsley, N. Y., April 17, aged 64 years. Mr. Barber is best known for his work in starting and building up the asphalt industry in this country. At different times he operated largely in this country, in Trinidad and in Venezuela. At the time of his death he was president of the A. L. Barber Asphalt Company.

Societies and Technical Schools

Massachusetts Institute of Technology—On April 14 the Mining Engineering Society listened to a lecture on rescue work by W. E. Mingramm, of the Drae-

ger Oxygen Apparatus Company, of New York. It was practically illustrated by sets of apparatus.

Michigan College of Mines—The annual class-day exercises, closing the 23d year of the college, were held at the college gymnasium, Houghton, Mich., on April 13. The address was delivered by Isham Randolph, of Chicago, who took "Reminiscences of Forty Years of Engineering Service" as his subject.

Montana Society of Engineers—At the meeting in Butte, March 13, a letter from a member was read on "Mining Operations in Korea and China," giving a clear account of labor and financial conditions in those regions, and caused much discussion and comment. The letter was accompanied by many photographs.

American Electrochemical Society—At the annual meeting at Niagara Falls, May 6-8, the first day will be devoted to the electrometallurgy of iron and steel. Papers are expected from Robert Turnbull, Paul Girod, Dr. A. Kjellin, Ernesto Stassano, Remo Catano, Ch. A. Keller, Gustav Gin, Henry D. Hibbard, F. A. J. Fitzgerald, P. McC. Bennie and Jos. W. Richards.

Salt Lake City Young Men's Christian Association—The Chemistry and Metallurgy class arranged this spring for a series of lectures by competent speakers. The list for April included the following: "Geology of Utah", by Fred J. Pack; "The Bingham Mines", by Louis Gates; "Park City Mines", by P. L. Williams, Jr.; "Milling and Concentrating." The May program is as follows: 4. "Copper Smelting", by E. P. Matthewson; 11. "Lead Smelting", by A. H. Richards; 18. "Mining Law", by Frank B. Stephens; 25. "Mining Stocks", by W. H. Tibbals.

American Society of Mechanical Engineers—The society will hold its spring meeting in Washington, May 4-7. Professional sessions will be held at which papers on the conveying of materials, gas-power engineering, steam turbines, the specific volume of saturated steam, oil-well pumping and various other subjects will be discussed. During the convention President Taft will hold a reception for the members at the White House. The War Department will give a special exhibition drill of the troops at Fort Myer. At the same time, if the conditions are favorable, an ascension of a dirigible balloon will be made and probably also that of an aeroplane. An address will be given by Rear-Admiral Melville, past-president of the society, and former engineer-in-chief of the navy, the subject being "The Engineer in the Navy." This address will be made the occasion for the presentation to the National Gallery of a portrait of Rear-Admiral Melville presented by friends and admirers. It will be received for the National Gallery by Dr. C. D. Walcott, secretary of the Smithsonian Institution.

Special Correspondence from Mining Centers

News of the Industry Reported by Special Representatives at San Francisco, Butte, Denver, Goldfield, Toronto, Mexico, London, Johannesburg

REVIEWS OF IMPORTANT EVENTS

San Francisco

April 16—Some legal tangles are developing in the sale of the Keane Wonder mine, Inyo county. The property was to be sold this week to satisfy a mortgage given to the Frances Mohawk Mining Company to secure a loan of \$200,000. A suit has been filed by a stockholder charging the management with fraud and asking an accounting for the benefit of the stockholders and forbidding the foreclosure sale.

A suit is being tried in Shasta county to foreclose a mortgage on the Brunswick mine near French Gulch. B. F. Rossi, of that place sold the mine to H. D. Lacey, of New York for \$60,000, of which \$40,000 was paid in cash and a mortgage was given for the balance. Lacey resists the foreclosure of this mortgage, alleging that his agents, who bought the mine for him, charged \$20,000 commission illegally. The case has not yet been decided.

Mining developments in Nevada county have been quite exciting of late, several properties showing up extremely rich ore. From the Central Consolidated, rich ore is being taken out at a depth of 400 ft. The channel in the Jenny Lind gravel mine has been cut and is found to be satisfactory. The Pittsburg Potosi-Gold Flat property is being opened near Nevada City and the old Nichols mine is being reopened. The old Ben Franklin mine is yielding good ore.

The Alaska mine at Pike City, Sierra county, is well known as the wettest quartz mine in the State. The mine has produced phenomenally rich ore at times, but again and again have the levels been flooded, and even when the men could work, it has been a difficult job to keep the water within bounds. Finally a great flood closed the mine for years. About four years ago new people undertook to unwater the mine with new pumps, electric power, etc., and it was only last week that the job was entirely completed after many difficulties and interruptions. They have resumed sinking the shaft at a point about 30 ft. below the 440 level, which was the bottom when the mine was finally drained.

During the last month there was quite a boom in the Humbug district of Siskiyou county, four miles west of Yreka, where the richness of the ore in the Inyo mine first called special attention to the district. A hundred or more claims were located within a few weeks, and now comes the discovery that the railroad company owns most of the ground. Some of the claims located are on open ground, but railroad ownership of the rest of the sec-

tion will prevent further locating of claims and further active development. There has been no deep mining done in that region, though a few mines have been yielding good ore. That from the Inyo claim is rich and is being sacked and shipped.

There is considerable activity at present in the section of the Argus range, Inyo county, below Wilson cañon. Rich gold strikes have been made near the towns of Custer and Monster, lying close together. Some of the ore is free-milling, but some will have to be smelted. The old mill from Wilson cañon is being taken in and will soon start up. In this camp there is plenty of water near the surface and timber is found within easy distance. There are now several hundred men in the district, and numbers of prospectors are going in.

Up in Plumas county a lot of miners are doing prospecting under difficulties. In the Brush creek section, sloping down to the north fork of the Feather river, about eight miles from Crescent, in Indian valley, a miner a short time since found rich specimen ore. He took some of it to Reno, Nev., where it was exhibited in a show window. This attracted so much attention that mining men in automobiles left for Plumas county and bonded the claims. Now a number of people are trying to locate claims on top of 12 ft. of snow.

Butte

April 16—President Anderson, of the Panhandle smelter, at Ponderay, now closed down as the result of action instituted against the company by the Greenough brothers, has recently given out a statement to the effect that the alleged over-issue of stock, which was the basis for the suit, is a mistake. President Anderson states that about 800,000 shares of the company's stock were sent on from Winnipeg, Canada, for transfer and new certificates were issued in lieu thereof, but by some misunderstanding the old stock was held by attorney E. C. MacDonald instead of being turned in for cancellation.

George W. Craddock has brought suit in the district court at Missoula against the Buffalo Mining Company for the sum of \$134,500. The action is brought to recover the value of 134,500 shares of the company's stock of which plaintiff claims to be the owner. The plaintiff claims that the company refuses to issue the stock to him and he is suing for its market value.

The State railroad commission is now in

session at Helena and has under consideration complaints of coal operators against the rates established by the railways in the State. The operators in the Bear creek district are the principal complainants, maintaining that the rates which they are compelled to pay prohibit them from competing with the operators in the Red Lodge district. The railroads have raised the point that the commission has no jurisdiction to establish joint rates and this phase of the situation may find its way into the courts, should the commission overrule this contention.

The Amalgamated Copper Company has recently declared a quarterly soc. dividend, payable May 31, and the Boston & Montana company a quarterly dividend of \$2 and \$1 extra per share. Much interest has been manifested in the recent rise of quotations on the stock of the East Butte company. It is rumored that the company, through William A. Paine, has secured an option on 700,000 shares of the treasury stock of the Pittsmont Copper Company, and also an option on a large portion of the 300,000 shares now outstanding. The Pittsmont property, with its operating smelter and its ground developed to a depth of 1500 ft., would enable the East Butte company to become a large producer.

Denver

April 16—In the Cripple Creek district the Vindicator Consolidated Gold Mining Company, whose dividends paid to date amount to \$1,980,000, has decided to pass the next quarterly dividend owing to the fact that they have passed through a zone of unusually low-grade ore, and that a payment had to be made of nearly \$12,000 in taxes. It is stated, however, that the ore is increasing in value again, and that the usual dividend will probably be paid next quarter. The report of the Doctor-Jack Pot Company gives the total receipts of the company at \$42,824, and net profit over disbursements \$33,093. The annual report of the Findley Consolidated Mining Company gives total receipts for the year at \$188,868; net profits over disbursements, \$37,403. It was stated that owing to the installation of improved mining machinery the cost of mining the ore was reduced from \$14 to \$9 per ton. The annual report of the Work company shows a total of \$49,302 received, and an expenditure of \$56,841, making a loss for the year ending March 31 of \$7538. The Mary McKinney mine, under lease to the

Western Investment Company, is credited with a production in March of 25 cars of ore of a gross bullion value of \$24,000.

The Portland Gold Mining Company has paid its second quarterly dividend for 1909 of 3c. per share, amounting to \$90,000, making a total received by the stockholders to date of \$8,317,080. News comes to hand that in prospecting the old workings at the 300 level of the Jerry Johnson, an orebody has been opened which for 30 ft. in width is being shipped as broken, the values running from \$20 to \$30 in carload lots, 12 cars having been sent out during the first half of April.

In Leadville, the Yak tunnel has penetrated the Fortune ground in South Evans gulch, and will soon pass the New Monarch and Cleveland shafts, and will drain the country adjoining it. It is stated that in the South Evans Gulch district there is great activity, and a number of properties are shipping; among them the Valley shaft is credited with a steady production of 40 tons of lead sulphides per diem, and the Favorite and Tenderfoot, south of Cleveland, are both shipping regularly. The greatest benefit that this tunnel enterprise will confer on Leadville and the mining interests of the State generally, is the draining of the Resurrection mine and the opening up of the immense low-grade orebodies which had to be abandoned some time ago.

Salt Lake City

April 17—The stock of the Utah Copper Company has recently been listed on the New York Stock Exchange. The annual report for the year ending Dec. 31, 1908, states the gross copper production for that year was 43,873,918 lb. The average price applying to sales of copper for the 18 months preceding was 13.2c., while the average cost per pound was 8.85c., this price being based upon the net pounds of copper resulting after smelter deductions and including all expenses of transportation, refining and disposition of metal. During the period covered by the report, \$4,005,018 were spent on improvements at the Garfield mill and power plant.

Quarters are being prepared for the new Utah Stock and Mining Exchange in the Atlas block, and it is expected that the first call will be made before the end of the month. The following governing board has been announced: David Keith, president, David Evans, B. F. Grant, Ezra Thompson, Windsor V. Rice, J. D. Murdoch and F. J. Westcott, of Salt Lake; John P. Creer, of Payson, and Joseph Berry, of Provo.

The Alta district is to resume shipping this week. The roads are being cleared of snow and as soon as they are ready for steady hauling the Columbus Consolidated will send out a heavy tonnage from the big orebody recently discovered on the fourth level below the tunnel. Manager Jacobson states that this orebody will av-

erage 30 ft. in width and is believed from present development to be of shipping grade for over 200 feet.

Goldfield, Nevada

April 13—The production of the Goldfield mines for the week ending April 10 was as follows: Consolidated 3850 tons, valued at \$173,250; Combination 630 tons, at \$28,350; Florence 850 tons, at \$21,250; handled by Western Ore Purchasing Company 850 tons, at \$255,000; Nevada Reduction Company 750 tons, at \$30,000; total production valued at \$507,850.

Indianapolis

April 19—Representatives of the Rock Island Coal Company, have consummated a deal by which 30 coal mines and a large acreage of coal lands in Indiana and Illinois, separated by the Wabash river, are under its control.

The Dering merger, which was in the Rock Island interests, several weeks ago offered the Dering 14 mines and some others to the Steel Corporation, and the sale was about to be perfected when, it is said, H. C. Frick overruled his associates and declared the deal off. This led to the appointment of a receiver for the Dering company. The receiver, however, discovered that the Steel Corporation was withholding payment of \$213,000 for coal sold to the Illinois Steel Company, which the court, during the past week, ordered the two steel companies to pay.

It is now predicted that, as a result of the deal just perfected for its land and mines, the Dering receivership will be dissolved. The deal includes the leasing of the Dering mines to the Brazil Block Coal Company on terms that will give better value to the Dering stock and bonds.

Jackson Dering has opened offices in the Old Colony building, Chicago, and will be in charge of the general business of the combine now controlled by the Rock Island people.

Toronto

April 17—The Board of Conciliation, appointed under the Lemieux act to adjust the differences between the Dominion Coal Company and its employees has reported to the Department of Labor at Ottawa. The difficulty is due to the existence of two rival labor organizations, the Provincial Workmen's Association, a purely Canadian body, and the United Mine Workers, an international organization. It was asserted by the employees, and admitted by the company, that it had discriminated against the members of the United Mine Workers, and refused to receive committees from that body. A majority report, signed by Judge Wallace, of Halifax, held that the company was justified in refusing to recognize international unionism,

and could not be expected to deal with two unions at one time. The report goes fully into the question of international unionism, contending that the United Mine Workers are practically a foreign organization, as the bulk of its members and the principal executive officials are resident in the United States. It is urged that American labor difficulties might lead to complications in Canada. If, through labor troubles in United States, a market were opened up there for Nova Scotia coal, pressure would be brought to bear on the Nova Scotia miners to prevent the export of coal. Strong exception was taken to a provision of the constitution, under which the officials may, at any time order a suspension of work in any district, if it is considered in the interests of the union—a power which no foreign body should be able to exercise over the industrial interests of Nova Scotia. The coal company is, therefore, considered as fully justified in refusing to recognize a union that could exercise so dangerous a power.

Daniel McDougall, representing the employees on the board, submitted a minority report condemning the company for discriminating against and refusing to recognize the United Mine Workers union, insisting that it was not a foreign, but an international body, and urging its recognition by the company.

The effect of the investigation and the disagreement of the board will probably be to intensify rather than to reconcile the differences between the company and its workmen.

Mexico

April 16—It is generally believed that the Mexican government will back up the long proposed railroad projected from Gutierrez through Sombrerete and Chalchicomula to Durango. The road is very much needed by the mining camps in western Zacatecas. This road was projected by the Robert S. Towne interests a year ago. The National Railways (the merger) has authorized the expenditure of 12,000,000 pesos on improving the Central division and widening the Interoceanic between Mexico City and Vera Cruz to standard gage. The Mexican Southern, an English company, is completing the recently acquired Oaxaca-Taviche road and extending the Tlaxcala branch from Oaxaca, also recently acquired, to Tula with the expressed intention of extending it to the Tehuantepec line. The Pan-American line from the Tehuantepec road along the coast to the Guatemalan boundary has recently passed to the control of the United Fruit Company interests, already owners of railroads and mines in Costa Rica and Guatemala. The Oaxaca Coal and Iron Company, concessionaires of coal and iron lands in southern Mexico, has a project for a railroad from Puebla to the Pacific and it is expected

that European capital will be secured to carry out the plan. An English syndicate is considering the proposed road from Comacho to the Mazapil copper district and then east to connect with the National line. This project has a guarantee from the state of Zacatecas. These railroads together with the other projects in northern Mexico, and the extensive Harriman extensions in Sonora and on the West Coast, promise to have a wide influence on the general business conditions of Mexico, and particularly to extend greatly the available fields for mining.

The Federal government is inquiring into the question of local support in the building of wagon roads and it is likely that some general policy to better the present deplorable condition in this regard will result. In many cases the local authorities not only do not contribute to the building of needed roads and their maintenance, but assert the right to collect a toll on such roads built by private interests. A notable State road has just been completed from the end of the Central line at Balsas, Gnerro, to Chilpancingo. This is over a rugged country and the new road is now opened for traffic. Automobiles will be used by the Oaxaca Coal and Iron Company to reach Tlaxalco, Oaxaca. The road is being repaired and the former two-days' trip on horseback will be cut to a few hours. Generally the transportation conditions of the country are improving, although slowly.

After lengthy negotiations, two of Col. W. C. Greene's standard enterprises have been acquired by a strong Canadian company headed by Dr. F. S. Pearson, of Toronto. They are the Sierra Madre and Pacific railroad running, southwest from Ciudad Juarez, to Nuevas Casas Grandes, and the Sierra Madre Land and Lumber Company, holding a vast tract of timber land in western Chihuahua. The Cole-Ryan interests were concerned in the railroad property by reason of a loan against it, and it was thought that for a time the property would fall to their hands. It is not given out on what terms the properties were acquired by the new owners. A bond issue of \$3,000,000 is solicited in Scotland for extensions and improvements and it is announced that the new company will not only extend the Sierra Madre road to connect with the Chihuahua & Pacific and then to the Pacific coast, but will also be interested in the projected road from Chihuahua to Monclova, Coah. The name of the new company is the Mexico Northwestern Railway Company organized under the laws of Canada, capital \$40,000,000.

London

April 15—The Palmarejo & Mexican Goldfields Company, Ltd., is raising fresh capital in order to erect a new mill and to carry on development work on lines laid down by E. T. McCarthy, who was re-

cently called in to advise the directors. The old plant, which was giving a poor extraction, has been shut down. It is anticipated that with a modern plant the extraction can be raised from 62 to over 90 per cent., and that the costs can be cut down nearly one-half. The new expenditure required, according to Mr. McCarthy, is £116,000. A sum, however, exceeding this is to be raised, namely, £175,000 by the creation of 700,000 new shares at 5s. each from which it appears that the company has debts to liquidate.

Recent development work in the mine has been satisfactory and there is a large quantity of ore in sight, estimated at 1,435,000 tons containing on an average 18 oz. silver. It is estimated that ore worth 13 oz. of silver will yield a fair profit. It has been decided to erect the new mill on the Zapote site and not at Palmarejo, on account of the abundance of water at the former place. The arrival of the Kansas City & Orient railway within easy distance of the company's property will benefit its development and allow work to be started on some of the outlying mines upon which prospecting work has given promising results.

The report of the Anglo-French Exploration Company, Ltd., has been issued. This company is largely interested in the eastern section of the Witwatersrand goldfield and has benefited by the favorable developments of the district. The largest shareholdings of the company are in the East Rand Proprietary mines, the New Kleinfontein Company, and the Van Ryn Deep Company, all of which have recently appreciated in value. As evidence of the improved state of affairs in the mining industry of the Transvaal, it may be noticed that a valuation of the holdings of the company at the end of the year, together with the cash or equivalent of cash, showed a surplus over the paid-up capital of the company of about £333,000, as compared with a surplus of about £63,000 at the corresponding period of the previous year.

A dividend of 10 per cent. on the ordinary shares in addition to that on the preference shares was declared, and a balance of 422,475 was carried forward to this year. The directors have appointed Edward J. Way consulting engineer to the company to date from Oct. 1 last.

The report draws attention to the steady progress that has been made during the last two years and anticipates a large increase in the gold production and the profits in the future. The recent development work in the deepest mines has been most encouraging, and a considerable reduction in the cost of working through consolidation of mines and through the greater efficiency of labor has been secured, so that the anticipations of prosperity in the future seem justified. If there is a weak spot in the situation it is with regard to the adequate supply of native

labor to meet the heavy demands that the opening of new mines and the extensions of old ones will make. But so far the natives have responded to an unexpected degree to the calls made and while this question is, no doubt, a factor upon which future expansion chiefly depends, there are at the present time no signs of a labor famine.

Johannesburg

The stope-drill competition, organized by the Chamber of Mines and the Transvaal government, has already been fruitful of promising results. The surface elimination trials commenced at the University College on Feb. 14, and nine types of machine have already been tested. The speed honors have so far fallen to a German hammer-drill, called the Westphalia, which is automatic and very light (65 lb., including its independent cradle). On actual drilling time, one test with this drill showed 4,906 in. per minute, and another 3,421 in. per minute, or on total time, 2,675 and 1,944 in., respectively. The Westphalia is not economical in air consumption, using 224 and 299 cu.ft. per foot drilled in the two tests, as compared with 193 cu.ft. by the Flottmann, another hammer-drill which did very good work. The average speed of the Flottmann was 4 in. per minute on drilling time, and 2.18 in. on total. These preliminary trials, to be followed in due course of time by the critical test of durability in mine work, have proved that a great mechanical advance has been made during the past year by the inventors and manufacturers of small drills. The Konomax, Waugh and Chersen, of which great things are expected, have not yet been tested.

The question of maintaining gold reserves, for the purpose of equalizing monthly output declarations, has already been discussed in the JOURNAL from different standpoints. The firm adopting the practice most freely has been the Werner-Beit-Eckstein, so that the defense made by Lionel Phillips, head of the group in South Africa, in his presidential address before the Chamber of Mines, bears special significance. He claimed that the reserve was created "so that the declaration of a regular monthly return, based upon the value of ore reserves, according to assay plans, could be maintained. The practice of keeping reserve gold under such conditions is highly desirable, as it tends to present speculative fluctuations in the value of securities, which annoy the genuine investor; and it certainly shields directors from the unpleasant accusations incident upon rises and falls in market quotations." Mr. Phillips pointed out, however, that in large producers, drawing ore from a great many points, the yields average themselves, and that in future the retention of reserve gold may thus become less necessary.

THE CURRENT HISTORY OF MINING

Alabama

Southern Steel Company—This company's properties were sold at bankrupt sale at Birmingham, April 12. They were bought for \$5,111,000 by W. W. Miller, of New York, acting for the reorganization committee. Notice was filed that the purchasers must care for pending litigation against the company.

Alaska

VALDEZ

Kenecott Mines—A snowslide occurred recently killing three men, among them being James Gray, a mining engineer, from England.

Copper River Railroad—Cordova is the center of much activity, as the railroad is open to the rapids on Copper river, and trains are carrying immense quantities of supplies to the front, which are being freighted up the river. River steamers made in Seattle and shipped knocked down have been shipped north for operation and will connect with the railroad.

Bonanza—The Morgan-Guggenheim syndicate, which controlled the Bonanza mine in Alaska under the name of Alaskan Copper and Coal Company has acquired minority holdings of H. O. Havemeyer estate, Norman Schulz and others. "The Morgan-Guggenheim syndicate is now building the Copper River railroad in Alaska, which will reach this property."

Arizona

GILA COUNTY

Arizona Copper—A new floor is being placed in the concentrator preparatory to the installation of Deister tables.

Inspiration—Capitalization, \$10,000,000; par value \$10. Development work on Clipper, Caraval and Americus claims, 2300 ft. Property consists of 23 claims, or about 300 acres. Adjoins Miami on the west. A low-grade copper property, and ore is said to be ideal for concentrating. Wm. B. Thompson, president; Geo. E. Gunn, general manager, and Henry Krumb, consulting engineer.

Superior & Boston—The capital is to be increased from \$2,000,000 to \$2,500,000, par value \$10; this is to add to the working capital, and pay for the Collins-Doyle group of claims.

Eureka—At the 600 level a crosscut encountered 10 ft. of good copper ore.

GRAHAM COUNTY

Shannon—The Greenlee group of claims is to be worked under option by the Shannon company.

PIMA COUNTY

Helvetia—C. C. Prindle, president, states that the daily shipments to Globe are 50 tons of 5-per cent. copper ore.

PINAL COUNTY

Imperial—About 800 tons of ore are being shipped daily to the Southern Arizona Smelting Company.

Arkansas

PKIE COUNTY

Arkansas Diamond Company—The property is near Murfreesboro. Fifteen men are employed in proving the ground. An experimental plant will be installed to handle 150 loads of ore per day. Orders are being placed for machinery and a large plant will be erected within the next 12 months.

California

AMADOR COUNTY

Eclipse Extension and Last Chance—Sold by the sheriff for delinquent taxes to A. V. Mandenhall, of Oakland.

BUTTE COUNTY

Butte Creek Consolidated Dredging Company—The new dredge has been completed, the power line connected and work has commenced.

CALAVERAS COUNTY

Challenge Group—This group of mines, comprising the Wabash, Fraction and Challenge, near Mokelumne Hill, owned by Casey, Davidson & Robinson, is now to be developed. During assessment work a blind vein was discovered which carries good values.

Flour Sack—A rich pocket of gold-bearing quartz and "black metal" was encountered recently.

PLUMAS COUNTY

Northern California & Nevada Consolidated Mining Company—J. D. Murray, one of the owners, has made a discovery of high-grade ore in a wide vein. Preparations are being made to install the first unit of a large mill.

SHASTA COUNTY

The Yuba Construction company has

launched the hull of a new dredge at Horsetown, 10 miles from Redding. There have been three dredges built at this place, two of which were burned and the third was taken apart to be rebuilt. The new dredge will shortly be put in operation.

Carnegie Mine Company—The Clipper group of copper mines, near Copley, has been sold to this San Francisco company. The group includes the Clipper, Old Judge, Little Blossom and Ridge mines in Backbone district.

Mammoth—The smelter is running at full capacity, treating about 1700 tons of charge per day, and producing copper at the rate of about 30,000,000 lb. per annum.

SIERRA COUNTY

Sixteen-to-One—The ore continues to be abnormally rich. The extent of the pay shoot is still unknown. E. H. Wilson is manager.

SISKIYOU COUNTY

At the Gardner & Weed four crews are at work in the upper and lower mines at Quartz Valley. Wright & Fletcher, of Oro Fino, are running their hydraulic mines full blast with an abundance of water.

Modoc—The recent find in this mine has attracted considerable attention to that part of the county. A number of the locations there are now being prospected.

TRINITY COUNTY

Headlight—This old mine, near Trinity Center, has been sold to New York men at a stated price of \$100,000; a partial payment has been made.

Enterprise—An important strike is reported.

Oriole—A. L. Paulsen has purchased the remaining half interest in this mine, or Indian creek, he already owning the other half.

TUOLUMNE COUNTY

U. S. Grant—Walter Cole is superintendent. A 1000-ft. tunnel is being run to tap the vein.

App—One of the best shoots of ore ever found in this old mine at Quartz has been found on the 1300 level. The ledge is about 13 ft. wide and some of it is specimen rock. The mine is owned by W. A. Nevills.

Black Oak—The mill at Soulsbyville, which has been running on old dumps, has been closed down temporarily. Good paying ore has recently been found in the

old workings which have been unwatered by S. A. Knapp and associates.

TULARE COUNTY

Green Butte—Development work is now going on in this copper property, two miles east of Portersville. Some ore will shortly be shipped to the Selby smelter.

YUBA COUNTY

Boston Consolidated—This company has been organized to work the claims on the Whittle place at Brown's Valley, adjoining the Dannenbroke and Pennsylvania mines. W. H. Allison, Charles Himes, C. L. Maseman and Louis Pierrat are the incorporators.

Colorado

LAKE COUNTY—LEADVILLE

New Monarch—The work of sinking and cutting stations on the Cleveland shaft is nearly completed. The stations are 9x12 ft., in one of which a pumping plant has been erected while the other will be used for unloading and hoisting. Regular shipments continue from the Winnie shaft.

Carbonate Hill—During the winter months, the Morning and Evening Stars and the Waterloo were the most active producers. The Yankee Doodle, Big Chief and Excelsior will soon begin active operations, work already being in progress on the Pyrennes property.

Sugar Loaf—The success which the Dinero and Bartlett tunnels have attained has marked the Sugar Loaf district as one of the most promising sections. Both of these properties are ore-producing. As soon as the weather permits work will be resumed on several other properties in this locality.

Coronado—Regular shipments of a good grade of iron ore are being made from the new portions of the Coronado property. A large body of this ore is in sight, and it contains a fair amount of silver.

Favorite—This property in the South Evans district is at present undergoing extensive development work, and shipments will soon be renewed.

Volley—A good grade of lead ore is being taken from this shaft. The gold content in the ore makes this locality practically independent of a fluctuating metal market. The drainage facilities afforded by the Yak tunnel promise to make the South Evans gulch one of the most active sections of the Leadville district.

OURAY COUNTY

Camp Bird—A strike of high-grade ore was recently made on this property, a 3-ft. vein being cut that was officially reported as assaying between \$200 and \$300 per ton.

TELLER COUNTY

Work—At the recent annual meeting the following directors were elected: J.

A. Connell, Marion Stark, W. R. Watterton, E. E. Quentin and H. C. Hall. The mine is being operated by leasers. The company owns the Little Clara claim which some months ago produced a large amount of ore. Marion Stark, of Colorado Springs, is manager of the property.

Gold Dollar Consolidated—A dividend of $\frac{1}{8}$ c. per share amounting to \$12,500, has been declared. The mine is under lease to the Union Leasing Company, which is shipping a large amount of ore. The property is situated on the east slope of Beacon hill.

Idaho

SHOSHONE COUNTY

Ajax—Lead carbonate and galena deposits were encountered recently.

Indiana

CLAY COUNTY

The joint meeting of the miners and operators of the Block coalfield was held April 15. The meeting adjourned to a future date without accomplishing much. There are a number of matters of considerable importance to be settled. The charge against several mine bosses with having sold rooms to miners is one of the things causing trouble. The feeling against the foreigners is strong because it is claimed they have been favored by the bosses in the distribution of the work. President Morgenthaler, of the miners' union, has called out the men in the Mary mine of the Otto Creek Coal Company, where trouble arose over installing machines.

GREENE COUNTY

Black Hawk Coal Company—This company's operations at Jasonville have been resumed after a three months shut down during which time repairs and improvements were made. The company announces that the orders received and booked are sufficient to keep the mine running for a year.

Shirley Hill—Mine No. 1, near Linton, has closed down until the demand for coal gets better. This mine has been worked more than any other mine in the Linton district for the past year.

VANDERBURG COUNTY

Coroner Laval has returned a verdict in the case of the mine explosion at the Sunnyside mine on March 20, in which six miners lost their lives. The coroner held that the explosion was caused by a "windy" or "illegal" shot. This, with coal gas and dust blown into the air was responsible for the loss of life.

Speck Mining Company—This company composed of 100 citizens of Evansville, has elected the following officers: President, Philip Speck; secretary-treasurer, William Swarmsted; directors Peter Walrath; J. S. Beeler, M. M. Hags; M.

L. Buckley and H. W. Flentke. The capitalization is \$1,000,000.

VERMILION COUNTY

The Dering mines in the Clinton field have been at work steadily this week whereas they had worked very irregularly before the change in management. The outlook in the Clinton field for steady operation at all the mines is regarded as the brightest in two years. There are three companies in this field—the Brazil Block, the Oak Hill and the Clinton Coal companies. The Clinton company operates three Crown Hill mines, employing 800 men, and none of these mines has been idle more than five days since last December. This company has recently bought large tracts of coal land adjoining the present holdings, and plans are being made to sink one or two new shafts soon. The Oak Hill company has let a contract to Charles Walter & Co., to sink one of its mines to the third or lower vein. The mines of this company have been operated a little over half-time. The Derings have six mines in operation in this field.

Louisiana

The Standard Oil Company, of Louisiana has been granted a charter in Louisiana with a capital of \$5,000,000. It will construct a \$2,000,000 refinery and run pipe-lines from Louisiana and Texas and compete with the Guffey Company in shipping southern oil north.

Maryland

ALLEGANY COUNTY

Consolidation Coal Company—At Ocean mine No. 2 recently, 17 cars broke loose from a trip which was being hauled up the slope. The cars jumped the track and knocked out several sets of timbers, causing a bad cave, which blocked the slope for several days.

Michigan

COPPER

Elm River—Crosscutting continues both ways from the bottom of the exploratory shaft, at a depth of 200 ft. from the surface. Some copper-bearing formations have been exposed, but nothing of a commercial value.

Oneco—Preparations are being made to begin diamond-drill operations as soon as the weather conditions will permit. Drilling will be started on line with the strike recently made at the New Baltic property.

New Baltic—Two drilling outfits are being erected to put down a series of holes. Trenching has been temporarily suspended, due to the spring breakup, and will be resumed as soon as the surface water disappears. A favorable-looking

formation was opened recently and is believed to be the northern extension of the Baltic lode.

Franklin—Report for the year ending Dec. 31, 1908, shows: Assets, \$420,754; liabilities, \$127,698; balance of assets, \$293,056. Surplus, \$192,261, as compared with a deficit of \$42,180 for 1907. Rock stamped, 342,596 tons; refined copper per ton of rock stamped, 10.82 lb.; refined copper produced, 3,703,421 lb. Total cost per ton of rock stamped, \$1.573.

Mohawk—Report for year ending Dec. 31, 1908, shows total working expenses at the mine including smelting, freight and general expenses, \$1,085,590; construction, \$21,796; mining profit, \$208,574. Total assets, \$712,332; liabilities, \$127,732. Rock stamped, 685,823 tons; refined copper produced, 10,295,881 lb.; yield, 15.01 lb. per ton of rock; cost per pound of refined copper, 0.605c. at the mine; smelting, etc., 0.938c. per lb. Total cost, 10.543c. per pound.

IRON—MARQUETTE RANGE

Ohio—This mine, owned by the Buffalo & Susquehanna Company, was the first mine on the range to begin shipments this season. A cargo was shipped to the Marquette docks last week.

IRON—MENOMINEE RANGE

Calumet—Work has been suspended for the present, and the men have been transferred elsewhere.

Dober—Arrangements have been made for increased shipments this season. This is an Oliver Iron Company mine, in the Stambaugh district.

Verona—A number of men are employed in exploration and several bodies of ore have been found.

Victoria—M. A. Hanna & Co., of Cleveland, have acquired this mine from the International Harvester Company. The property is to be opened and thoroughly tested.

Minnesota

IRON—MESABI RANGE

Canisteo—At this mine, on the western end of the range, progress is being made with the large washing and concentrating plant. The plant is near Trout lake and will handle ore from the Holman and Walker as well as the Canisteo. At the last-named mine stripping is being done.

Hull-Rust—The work of stripping on this mine near Hibbing is making steady progress. It is claimed that the orebody already proved is the largest on the range.

Lincoln—Work for the season is well started on this mine at Virginia, owned by the Jones & Laughlin Steel Company.

Longyear Lake—This mine, owned by the Euclid Iron Company, is in the Chis-

holm district. It is operated partly by shaft and partly by open pit.

Silver—M. A. Hanna & Co., owners, have the stripping well advanced, and so much of the orebody is uncovered that large shipments will be made this season.

IRON—VERMILION RANGE

Section 30—This mine near Ely is now in the hands of George A. St. Clair, of Duluth, and operations will be resumed to test its value. There are two shafts, one down 300 ft. and the other 700 ft. Both are to be sunk deeper.

Montana

BUTTE DISTRICT

Butte Coalition—The Rarus and Trainway mines are steadily increasing their output and have recently shipped as high as 1700 tons a day. The great amount of development work which has been carried on in the Tramway and Minnie Healy mines for the past year has reached a stage where the orebodies are now ready for working and it is expected that there will be a gradual increase in production from now on. The Tramway shaft has passed the 1700-ft. mark and a crosscut is now being driven from the Rarus to connect the two mines at that depth.

Nevada

ESMERALDA COUNTY

Goldfield Consolidated—A large orebody was encountered last week on the Lucky Boy claim assays from which average \$75 per ton across its entire width of 10 ft. The ore was encountered in a drift on the 300-ft. level of the Red Top company workings. Shipments from the Hampton stope were resumed on April 14 at the rate of one carload per day.

ESMERALDA COUNTY—BLAIR

Nevada Bay State Oil Company—The drill is now working at a depth of about 950 ft. A stratum of black sand heavily impregnated with oil was encountered at 915 ft., but the formation directly beneath was so hard that operations were suspended pending the arrival of heavier casing.

ESMERALDA COUNTY—BONNIE CLARE

Bonnie Clare Mining and Milling Company—This company has undergone a reorganization, and plans are being made to again operate the property.

ESMERALDA COUNTY—RAWHIDE

Razchide Queen and Coalition Estates—Malcolm Macdonald and his assistants expect to complete the examination of these properties next week.

NYE COUNTY—BULLFROG

Diamond Queen—A 30-ton shipment was made from the Culver-Hargrave lease

last week which was settled for at the rate of \$95 per ton. The company is at present driving a crosscut from the 100-ft. level of the new shaft to tap the orebody 75 ft. distant.

Montgomery Shoshone—This property shipped 15,000 oz. of bullion April 6, making a total production for March of 29,000 ounces.

Aurora Bullfrog—Ore that assays \$20 per ton was encountered in the shaft. A station will be cut at the 300-ft. level and laterals run to pick up the vein at that depth.

NYE COUNTY—PIONEER

Bullfrog Pioneer Leasing Company—Ore running from \$12 to \$15 per ton was encountered in what is known as the Office tunnel, 500 ft. from the main shaft. The ore bins at Springdale, the railroad shipping point, are now completed, and with the new hoist in commission a production of 100 tons per day will be attempted.

Rickard Lease—The new 25-h.p. hoist was placed in commission last week, and the three-drill compressor will be in operation by the middle of the month. Good pannings are reported in the bottom of the shaft, now 75 ft. deep. Work will continue in the shaft at the rate of 4 ft. per day.

Moyflower—Favorable reports come from both the mine and mill. Four power drills are being added to the underground equipment. A system of development work has been adopted which will take six to eight months to carry through. The property has been surveyed and divided into lease blocks.

NYE COUNTY—JOHNNIE

Johnnie Consolidated—The output for March was \$16,000. The showing on the 700-ft. level is reported as better than anything heretofore found on the property, one shoot of ore being 18 ft. wide.

NYE COUNTY—TONOPAH

Tonopah Extension—A continuation of the work on the 400- and 700-ft. levels is the only development work going on in this property at present. The west drift on the South vein shows a decided improvement and bunches of good ore are exposed in the breast. The work now being performed is the blocking out of a large tonnage to be available on completion of the mill.

MacNamara—The shaft was sunk 28 ft. during the past week, being now 606 ft. deep. Five feet of good milling ore are exposed on the 200-ft. level in the stope from the west drift. On the 275-ft. level, two stopes have been connected exposing an average width of 7 ft. of good ore for a distance of 50 ft. Shipments for the week amounted to 350 tons.

Midway—Work was resumed early last week after a shutdown of five days caused by an accident to the boiler. Several stringers of ore have been encountered on

the 635-ft. level, which are being drifted upon with encouraging results.

West End—A large amount of work is being done on the 200- and 400-ft. levels, and several good oreshoots have been opened. Two hundred tons of ore were shipped during the week.

WHITE PINE COUNTY

Cumberland-Ely—Production in March was 1,450,000 lb.; shipments, 1,636,171 lb. Recent figures are said to show a cost of production of 7.85c. per lb., delivered at New York, crediting railroad and smelter earnings against copper cost.

Nevada Consolidated—Production in March was 1,750,000 lb.; shipments, 2,168,088 lb. The net cost of copper delivered at New York is figured recently at 7.03c. per lb., crediting railroad and smelter earnings against copper cost. The Step-toe Valley smelting works now has three reverberatory furnaces in operation.

New Mexico

GRANT COUNTY

A strike of high-grade ore was made on the Ridgewood claim, about a mile and a half southeast of Sylvanite, and adjoining the Gold Hill property on the south. The strike was made practically at the surface. The rich streak is from 12 to 15 in. thick. Sylvanite has been quiet for the last few weeks, and this new find has created a good deal of excitement. About half a ton of this ore has been sacked for shipment, and men are to be put to work at once saving all the high-grade.

SOCORRO COUNTY

Billings Smelter—J. A. Lowe, manager of the Pan-American Federal Smelting and Refining Company, states that the old smelter will be remodeled and enlarged to 750 tons per day.

Oregon

JACKSON COUNTY

Cascade Coal—A bed of bituminous coal, reported to be of good size and quality, has been encountered in the Sunnyside mine on the Broadbent property, near Medford.

BAKER COUNTY

Humboldt—A mill is being erected by John Arthur, lessee of this property in the Mormon basin mining district.

Pine Creek—All the old claims are operating and several new placers have been opened up in the Burnt creek district.

Pennsylvania

ANTHRACITE COAL

North Mahanoy Colliery—All efforts to extinguish the fire which recently started in this colliery, near Pottsville, have failed. In order to prevent the fire from spreading to the adjoining St. Nicholas and

Shenandoah collieries, it has been decided to wall up the workings and fill the mine with water. The colliery is owned by the Reading company.

South Dakota

LAWRENCE COUNTY

Elliptic—The development work is being watched with much interest on account of the exploration of the deep formations. It has installed an excellent new diamond-drilling equipment to replace that hitherto in use.

Globe and Gilt Edge Maid—On April 6 these mining properties were sold at sheriff's sale. The former mill is a metallurgical fiasco; the latter a dry crushing mill well situated to handle a large tonnage economically, though handicapped by a few constructional drawbacks and rather low-grade ore.

Tennessee

Tennessee Copper Company—Walter Lewisohn states that the contract with the United States Agricultural Corporation is now closed. The Tennessee Copper Company has already received \$500,000 in cash, and will receive \$1,000,000 before the end of July. The agreement between the Tennessee Copper Company and the United States Agricultural Corporation, whereby the latter acquires all the acid output of the former, stipulates payments as follows: \$1,500,000 preferred stock of the Agricultural Corporation, of which \$500,000 has already been paid in cash (the stock having not yet been issued), and of which \$1,000,000 is to be paid Jan. 1, 1910; \$825,000 in common stock, to be paid over to the Tennessee Copper Company upon issuance; \$1,000,000 cash payable during May and July, this year; and \$1,000,000 cash and \$250,000 in preferred stock to reimburse the Tennessee Copper Company for improvements and additions to that extent made to the sulphuric plant.

Utah

BEAVER COUNTY

Majestic Mines—In the new silver-lead orebody on the 500-ft. level of the Harrington-Hickory, it is stated that the north drift is in about 60 ft. and the south drift about 30 ft., and as yet the walls have not been encountered. This is said to be the best showing of silver-lead ore that has been found on the property in recent years.

Moscow Bonanza—D. H. Ferguson, superintendent of the Cedar-Talisman, has taken a lease on this property adjoining the Burning Moscow.

Leonora—The tunnel is now in over 200 ft. in very promising territory. The tunnel is to develop a group of 11 claims in the Star district in the vicinity of the Cedar-Talisman, Mowitza, etc.

Beaver Carbonate—A large body of low-

grade ore has been encountered on the 700-ft. level, about 100 ft. farther east than where the first ore was opened on this level. D. C. Williams is in charge of the mine.

Deer Trail—Development work has been in progress all winter on this property near Marysvale. A good grade of gold bearing ore has been opened up and numerous improvements are contemplated during the summer.

SALT LAKE COUNTY

Utah Copper Company—During March upward of 7000 tons of ore were milled per day, production being estimated at between 4,500,000 and 5,000,000 lb. of copper. This is the first month when the company has had all 12 sections of its Garfield mill in operation.

Boston Consolidated—During March, 10 of the 13 sections of the mill were in operation. Ore milled was 53,100 tons, producing 2750 tons of concentrates, containing 1,105,000 lb. of copper. The eleventh section will go into operation during April. The Porphyry mine in March produced about 300,000 lb. of copper.

United States Smelting, Refining and Mining Company—Internal difficulties in this company have been settled by the purchase of the stock of R. D. Evans, amounting to about 100,000 shares, which has been taken over by the Winslow faction. The transaction involved about 60,000 shares of common and 40,000 shares of preferred stock. The price is said to have been somewhat above the recent quotations.

Utah Consolidated—The report for the operations of 1908 shows that 248,215 tons of ore were treated, producing: copper, 10,648,243 lb.; silver, 265,284 oz.; gold, 23,440 oz. The net profits for the period are given at \$326,312. The company carries a reserve for contingent liabilities of \$452,435 and the profit and loss surplus is \$1,256,952.

Washington

KITTITAS COUNTY

Skookum Copper—Construction work is progressing on the big concentrator in the Cle Elum district, and it is expected that this plant will be turning out concentrates by the middle of the summer.

OKANOGAN COUNTY

Gold Dust—A deposit of good copper ore was recently encountered on one of the lower levels.

Dry Gulch—E. M. Cammon has opened a 4-ft. vein of low-grade copper ore, three miles east of Oroville.

Canada

BRITISH COLUMBIA

Among recent company incorporations filed at Victoria are the following: The Slimes Treatment Company, Ltd., to ac-

quire the metallurgical patents granted Horace G. Nichols, of Ymir, B. C., for treating slimes or sands from which the valuable contents have been extracted by cyanide from gold and silver ores, and generally for recovering the solutions from pulp and extracting the solid contents from mill tailings. The Tyce-Swayne Copper Mines, Ltd., to acquire certain mineral claims adjoining Lynn creek, New Westminister mining division, B. C., and to have said claims mined and managed by the Tyce Copper Company, Ltd. The authorized capital of each company is \$100,000.

BRITISH COLUMBIA—SLOCAN

Lucky Jim—Work has been resumed at this lead-zinc mine, situated on the Kaslo-Sandon railway line. Arrangements are being made to ship ore, much of which contains a large proportion of zinc.

Slocan Star—The Byron N. White Company has shipped some high-grade silver-lead ore from the Hidden Treasure claim of its Slocan Star group. The Consolidated Mining and Smelting Company of Canada, Ltd., opened a body of valuable ore on its Richmond-Eureka property, and its Eureka No. 5 tunnel has been driven through one corner of the Hidden Treasure claim, in ore all the way. The White Company is driving on the vein in its Slocan King claim at a depth on the dip of vein of 650 ft. below the above-mentioned ore shoot on the Eureka.

BRITISH COLUMBIA—SIMILKAMEEN

Daly Reduction Company—The spring thaw has caused water to flow in the flume from Twenty-mile creek, so power is available for the stamp mill at Hedley and the stamps are dropping again.

Golden Zone—A shaft is being sunk in good ore. This mine is in Hedley camp.

Yale Mining Company—Work has been resumed at the Nickel Plate mine, near Hedley, after the winter shut-down.

NOVA SCOTIA

Nova Scotia Steel and Coal Company—The bill now before the Nova Scotia legislature to enable this company to effect a financial reorganization, which provides for the redemption of the company's preferred stock at \$120 per share, has been amended owing to the objections of the shareholders to being forced to accept that figure, leaving the holders of preferred stock at liberty to fix their own price.

ONTARIO—COBALT DISTRICT

Bailey—This company has cancelled the lease, under which the north half of the property has been worked by the Cobalt Central mines, from April 1, and will shortly begin diamond drilling on a large scale to prove several veins which look well on the surface. Arrangements are being made for the installation of a large plant and buildings to accommodate a larger force of men. Power will be ob-

tained from Ragged Chutes on the Montreal river.

Beaver—The engine house was destroyed by fire on April 5. Operations were resumed, the company obtaining a supply of power by arrangement with the Temiskaming.

Cobalt Treasure—At a meeting on April 7, in Toronto, terms were arranged for an amalgamation between the Cobalt Treasure and the Paymaster; giving the consolidated company 63 acres and a capitalization of \$2,000,000. A shaft is down on the property 110 ft. J. Trethewey is president and G. H. Schlund, Cobalt, secretary.

Alexandra—A vein encountered at the depth of 160 ft. as a narrow stringer has widened at the 170-ft. level and shows good silver contents. A new calcite vein 6 in. wide, has been found on the surface.

Ore Shipments—Shipments of ore from Cobalt for the week ended April 10 were: Crown Reserve, 118,340 lb.; Cobalt Central, 43,490; City of Cobalt, 109,000; Kerr Lake, 40,360; La Rose, 324,540; Nipissing, 128,880; O'Brien, 64,170; Right of Way, 283,000; Silver Queen, 62,865; Temiskaming, 120,000; total, 1,294,653 pounds.

YUKON TERRITORY

The new reduction plant of the Yukon District Gold Mining Company, Ltd., at Conrad, is in successful operation, and producing concentrates which are shipped to Tacoma.

Mexico

CHIHUAHUA

Alvarado—Boston capitalists are operating the mine under a 15-year lease. Plans are being made to handle 1000 tons per day.

DURANGO

Velardeña—One copper and three lead furnaces are in operation. Ore is accumulating, and another furnace will be blown in soon. There is a general improvement in the camp.

MEXICO—EL ORO

Esperanza—The last dividend makes the returns to shareholders 410 per cent. upon the capitalization of \$2,250,000. Recent installations of machinery and improved mining methods have made this property more profitable than ever before.

El Oro—Report for March: Mill No. 1 ran 31 days, mill No. 2 ran 30 days; ore crushed, 26,331 tons, yielding \$214,740; working expenses \$118,490; expenditure on development \$23,121; total \$141,611; profit \$73,129; profit on railway \$4000; total profit \$77,129; expenditure on permanent improvements \$1000.

Mexico Mines—Report for March: Mill ran 23 days, crushed 6524 tons of ore, yielding \$76,020; expenses \$32,790; expenditure on development \$8600; total

\$41,390; profit \$34,630; expenditure on permanent improvements \$1000.

OAXACA

Natividad—The differences between the two factions have been settled by a compromise. Dr. Carlos Fenelon has been chosen president in place of Antonio Alende.

Victoria-Tapada—Three carloads of boilers and supplies have arrived for the new mill.

SONORA

Creston-Colorado—Two hundred and fifty tons of ore per day are crushed. Since 1902 this property has paid its shareholders \$3,387,000.

Africa

TRANSVAAL

The gold production in March is reported by cable at 608,000 oz. fine; an increase of 42,782 oz. over February, and of 33,509 oz. over March, 1908. The gain was due to the greater length of the month, the daily average having decreased from 20,186 oz. in February to 19,613 oz. in March. For the three months ended March 31 the total output was 1,677,160 oz. fine gold in 1908, and 1,788,331 oz.—or \$36,964,802—in 1909; an increase of 111,171 oz., or 6.6 per cent.

Asia

INDIA—MYSORE

Kolar Goldfield—Gold production in March is reported at 46,284 oz. bullion, being 4125 oz. more than in February. For the three months ended March 31 the total was 135,869 oz. bullion in 1908, and 135,805 oz. in 1909; a decrease of 64 oz. only. The bullion reported this year was equal to \$2,526,391, or 122,225 oz. fine gold.

Australia

NEW SOUTH WALES

Gold production in March was 7645 oz.; for the three months ended March 31 it was 55,752 oz., or \$1,152,394 in value.

New Zealand

Gold exports in March were 41,485 oz. bullion in 1908 and 40,044 oz. in 1909; decrease, 1441 oz. Exports of silver, 89,038 oz. in 1908, and 204,008 oz. in 1909; increase, 114,970 oz. The gold bullion reported this year was equal to \$809,307, or 39,154 oz. fine gold.

The Mines Department reports that gold exports in January were 59,072 oz. bullion in 1908, and 35,956 oz. in 1909; a decrease of 23,116 oz. The bullion reported this year was equal to \$709,823, or 34,341 oz. fine gold. Exports of silver were 111,207 oz. in 1908, and 44,426 oz. in 1909; a decrease of 66,781 oz. this year.

QUOTATIONS FROM IMPORTANT CENTERS

Coal Trade Review

New York, April 21—The coal trade in the East remains quiet as far as bituminous is concerned. The only marked incident is found in the fact that West Virginia mines are bidding more actively for business and low prices have been made for Pocahontas and New River coal, f.o.b. Newport News and Lambert's Point. It is said that there is to be a readjustment of rates on West Virginia and Pennsylvania coals.

The anthracite situation shows nothing new this week. The operators' committee, the appointment of which was noted last week, has made no report as yet, and probably will make none for several days. The miners have intimated their determination not to accept the terms offered by the operators, but it is quite possible that a change may come after the meeting which is to be held April 22. The situation is unchanged, but there are no indications that the operators will give way.

In the West, steam-coal trade continues to show a slight improvement, which is comparatively steady, although not marked. It is noticeable throughout Indiana and Illinois that while mines are restricting shipments for the present, they are preparing for a large trade. The opening of the Lake trade is temporarily held up by the controversy over rates to Lake ports. There were some fears of a strike on Lake vessels, owing to the insistence of the Lake Carriers' Association on the open shop; but it looks now as if this would not seriously interfere with shipments.

Lake Coal Rates—The different railroads concerned have announced the following rates to Lake Erie ports on Lake coal, effective May 15. The rates are given in cents per ton, the third and fourth columns showing the differential, compared with the Pittsburgh district, as a base:

	Rates		Differential	
	Old.	New.	Old.	New.
Pittsburg.....	88.00	88.00	—	—
Ohio.....	86.00	85.00	— 3.00	— 3.00
Fairmont, W. Va. .	96.75	100.00	+ 8.75	+ 12.00
Kanawha, W. Va. .	97.00	106.25	+ 9.00	+ 18.25
New River, W. Va. .	113.00	121.25	+ 25.00	+ 33.25

Immediately after the publication of these rates a number of West Virginia operators applied to the United States district courts for West Virginia and secured a temporary injunction restraining the railroads from filing or enforcing the new rates, with April 23 fixed as the date for arguing the case.

COAL TRAFFIC NOTES

Tonnage originating on Pennsylvania railroad lines east of Pittsburgh and Erie, year to April 10, short tons:

	1908.	1909.	Changes.
Anthracite.....	1,461,137	1,404,832	D. 46,305
Bituminous.....	9,329,117	9,750,218	I. 421,101
Coke.....	1,970,634	2,749,239	I. 778,605
Total.....	12,760,888	13,904,289	I. 1,143,401

The total increase this year to date was 9 per cent.

Bituminous coal and coke shipments, Pennsylvania and West Virginia, two months ended Feb. 28, short tons:

	Coal.	Coke.	Total.
Balt. & Ohio.....	3,118,618	661,092	3,779,710
Buff. Roch. & Pitts.	897,383	68,626	966,009
Buff. & Susquehanna	263,853	48,023	311,876
Penn. (Inc. N. Y. C.)	1,288,147	14,936	1,303,383
Pitts. & L. Erie.....	1,014,213	687,195	1,701,408
Norfolk & Western.	1,836,620	428,914	2,265,434
Ches. & Ohio.....	1,883,543	75,007	1,958,550
Total.....	10,302,577	1,983,793	12,286,370
Total, 1908.....	9,527,201	1,222,594	10,749,795

Total increase this year, 1,536,575 tons, or 14.3 per cent. In addition the Baltimore & Ohio carried 154,302 tons anthracite in 1908, and 163,824 in 1909; increase, 9522 tons.

Coal tonnage of railroads in Ohio Coal Traffic Association, two months ended Feb. 28, short tons:

	1908.	1909.	Changes.
Hocking Valley.....	413,856	471,013	I. 57,157
Toledo & Ohio Cent..	176,082	174,988	D. 94
Baltimore & Ohio.....	239,984	172,927	D. 121,667
Wheeling & L. Erie.	420,151	406,647	D. 13,504
Cleve., Lorain & Wh.	397,779	283,600	D. 113,979
Zanesville & Western	216,286	206,456	D. 8,830
Toledo Div., Pen. Co.	317,879	308,205	D. 9,674
L. Erie Alliance & W.	190,226	177,751	D. 12,475
Marietta, Col. & Cleve.	12,577	6,882	D. 5,695
Total.....	2,436,820	2,208,069	D. 228,751

The total decrease shown this year was 9.4 per cent.

Coastwise shipments of coal from leading Atlantic ports, two months ended Feb. 28, long tons:

	Anthracite.	Bitum.	Total.	PerCt.
New York.....	2,332,397	1,610,236	3,942,633	65.0
Philadelphia.....	274,750	690,443	965,193	16.9
Baltimore.....	28,429	536,707	565,136	9.3
Newp't News.....	373,631	373,631	747,262	12.2
Norfolk.....	217,312	217,312	434,624	7.1
Total.....	2,635,576	3,428,329	6,063,905	100.0
Total, 1908.....	2,884,787	3,489,836	6,374,623	

Total decrease this year, 310,718 tons, or 4.9 per cent. New York includes all the New York harbor shipping points.

Coal shipments by water from Seattle and Tacoma, Wash., two months ended Feb. 28 were 112,654 tons in 1908, and 43,223 in 1909; a decrease of 69,431 tons.

Coal tonnage passing Lock No. 3 on the Monongahela river was 777,335 tons in February; for the two months ended Feb. 28 it was 1,705,739 tons.

Coal receipts at St. Louis, two months ended Feb. 28, were 1,339,952 tons in 1908.

and 1,203,135 in 1909; decrease, 136,817 tons.

New York

ANTHRACITE

April 21—Current trade continues steady and it is not at all affected by strike rumors. For prepared sizes business is good, many taking advantage of the April discount. No announcement has been made yet as to the discount in May, but something is expected daily. Steam sizes are still rather scarce.

Prices are \$4.25 for lump and \$4.50 for egg, stove and chestnut f.o.b. New York harbor points. For small steam sizes prices are nominally: Pea, \$3.25@3.50; buckwheat No. 1, \$2.35@2.50; buckwheat No. 2 or rice, \$1.60@2; barley, \$1.35@1.50; all f.o.b. New York harbor points. Advances are asked by commission merchants.

BITUMINOUS

Trade on the Seaboard continues slow. Contracts are dragging and it looks as if a considerable number—much more than usual—would go over until after May 1. The trade has been rather demoralized in New England territory by offers of West Virginia coal at low prices and by reports as to the intentions of the new Virginian railway to cultivate Eastern trade. The far East, accordingly, seems to be holding back, although it is known that consumers' stocks are low.

Along the Sound, trade is only fair and orders are rather irregular. New York harbor is the same as it has been for some time, buyers apparently watching for chances to get cheap coal. Fair grades of steam coal can be had at \$2.35@2.40 f.o.b. harbor points, and some speculative coal has sold as low as \$2.20.

All-rail trade continues fair. Transportation is rather slow, although car supply is good; and there is some delay in tidewater deliveries.

In the Coastwise vessel market there is a temporary scarcity of boats, which is due to foggy and stormy weather holding vessels at Eastern ports. Rates from Philadelphia are unchanged. From New York cargoes have been taken at 60c. to points around Cape Cod, and 70c. to Lynn and Saco.

Birmingham

April 19—The coal market in Alabama shows no improvement. The production is about the same it has been for the past

four months. Coal miners complain as to the unsteady work. There have not been many mine workers leaving the district so far, the anticipation being that there is soon to be a change for the better. Coke ovens are doing well, as coke is being stacked up and there is a little better demand for the product. Coal quotations are down, but this has not proved much inducement in securing business.

Chicago

April 19—Quiet conditions of buying and selling continue in the coal market. Wholesalers and retailers alike are selling small lots, the weather conditions and the caution among consumers being dominant on the market. Fine coals continue to increase in demand and will grow in popularity as warm weather advances. Little demurrage coal is on the market.

Illinois and Indiana lump brings \$1.75@2.25; run-of-mine, \$1.05@1.75, and screenings, \$1.40@1.60. There is some over-shipment of the best grades of Illinois lump.

Eastern coals are in good condition generally, smokeless being free from demurrage evils and selling at \$3.20@3.45 for lump and \$3.05@3.15 for run-of-mine. Hocking Valley is in somewhat too plentiful supply, with prices 10 or 15c. under the \$3@3.15 standard quotations. Youghiogheny at \$3.15 for gas lump and Pittsburgh No. 8 at \$3.85, remain steady, though Pittsburgh occasionally has demurrage troubles and consequent low sales.

Cleveland

April 20—The spring weather has stopped domestic coal-trade activity. Some Massillon coal is selling at \$2.25@2.30 for lump and \$2.15 for run-of-mine, both at mines. Steam-coal sales are better than they have been, but without much improvement in prices, which may be quoted around \$1.35 at mine for lump, \$1.10 for run-of-mine, and 55¢@75c. for slack.

It does not appear likely that the attitude of the unions will interfere with Lake shipments. The controversy over the new rates from the mines will have some effect in delaying shipments.

Indianapolis

April 10—Master in Chancery Edward Daniels, in addition to offering for sale by virtue of a decree of the Federal Court on May 1, at Bloomfield, Ind., a large amount of mining property belonging to the Indiana Southern Coal Company, will also, on the same day, sell to the highest bidder at the court house in Sullivan, Ind., the following property belonging to the Southern Indiana Coal Company: The Calmore, the Shelburn, the Alum Cave, the Forest Park, the Cummings, the Indiana Hocking, the Citizens, the Rainbow, the Bunker Hill, the Richmond, and the

American mines, together with adjoining tracts of coal land and timber land. The proposed sale is creating much interest and the number of bidders promises to be large.

Pittsburg

April 20—Lake shipments are limited, as few of the large boats are ready to go into commission. The Hanna interests are sending out considerable tonnages and, as they are buyers of the surplus product of the Pittsburg-Buffalo Company, that concern is operating its mines almost to capacity. The railroad mines in the Pittsburg district are being operated at between 50 and 60 per cent., but all of the river mines are going. While efforts are being made to hold the price at \$1.15 for mine-run coal at mine, the bulk of the sales during the past week have been at \$1.10 and less. Slack is quoted at 55¢@60c. The rivers were navigable during the closing days of last week; some coal went to lower ports and a number of empty coal boats and barges were returned.

Connellsville Coke—There are no signs of improvement and ovens are being closed. Furnace coke has sold down to \$1.40 for prompt shipment and foundry spot at \$1.85; and it is possible that a lower price would be accepted. On contract foundry coke is quoted at around \$2 and for second half, \$2.10, could be done, although some producers are naming \$2.25 as the minimum price for late shipments. On contract, furnace coke is quoted at \$1.60@1.75, and it is understood these prices would be taken for delivery in the third quarter, but not for the entire second half.

The Courier gives the production for the week in both regions at 233,718 tons. The shipments amounted to 8679 cars as follows: To Pittsburg district, 3579; to points west of Pittsburg, 4358; to points east of Connellsville, 742 cars.

Foreign Coal Trade

British Coal—Exports of fuel from Great Britain, with coal sent abroad for the use of steamships in foreign trade, three months ended March 31, long tons:

	1908.	1909.	Changes.
Coal.....	14,211,160	13,914,097	D. 297,063
Coke.....	289,935	270,145	D. 19,790
Briquets.....	378,642	338,915	D. 39,697
Total exports....	14,879,727	14,523,157	D. 347,570
Steamer coal.....	4,704,209	4,520,902	D. 183,307
Total.....	19,574,386	19,044,059	D. 530,877

The total decrease in coal sold for consumption beyond the limits of the United Kingdom was 2.7 per cent.

Welsh Coal Prices—Messrs. Hull, Blyth, & Co., London and Cardiff, report current prices of coal as follows, on April 10: Best Welsh steam, \$3.54; seconds, \$3.42; thirds, \$3.30; dry coals, \$3.48; best Mon-

mouthshire, \$3.12; seconds, \$3.06; best small steam, \$2.46; seconds, \$2.16. All per long ton, f.o.b. shipping port.

German Coal Trade—Imports and exports of fuel in Germany, two months ended Feb. 28, metric tons:

Imports:	1908.	1909.	Changes.
Coal.....	1,357,177	1,136,541	D. 220,636
Brown coal.....	1,364,119	1,101,313	D. 262,806
Coke.....	4,163	100,223	I. 16,060
Briquets.....	31,439	30,606	D. 833
Exports:			
Coal.....	3,138,626	3,511,347	I. 372,721
Brown coal.....	4,043	4,553	I. 510
Coke.....	664,031	531,077	D. 132,954
Briquets.....	272,279	203,955	D. 68,328

Coke exports this year included 4716 tons to the United States.

German Coal Production—Coal production in German Empire, two months ended Feb. 28, metric tons:

	1908.	1909.	Changes.
Coal.....	25,221,866	23,562,253	D. 1,659,613
Brown coal.....	11,106,716	10,892,090	D. 214,626
Total mined.....	36,328,582	34,454,313	D. 1,874,269
Coke made.....	3,634,541	3,428,731	D. 205,810
Briquets made.....	2,936,120	2,876,673	D. 59,447

Of the briquets reported this year 2,263,870 tons were from brown coal, or lignite.

Iron Trade Review

New York, April 21—The iron and steel trades continue to improve and, though the gain is somewhat irregular, there is marked activity in several lines, while in others there is a perceptible advance. It is to be noted that at the annual meeting of the Steel Corporation yesterday, Judge Gary expressed himself hopefully and noted a considerable improvement over the December quarter.

Structural steel is the most active section of the market and large orders for bridges and buildings continue to be placed. Building material of all kinds is very active and the aggregate tonnage placed has been large. There has also been an active trade in bars. It is reported that prices have been cut to secure some large orders and that there is sharp competition for the business which is coming forward. Sheets also have been active, though not quite to the same extent as bars and structural steel; nevertheless a fair business has been done. The American Steel and Wire Company has announced a reduction of \$2 per ton on wire and wire products. This was generally expected, but the cut is less than had been anticipated.

Rail orders are coming in slowly. There have been reports that a reduction in prices of steel rails was under discussion, but it is not possible to ascertain anything definite on this point. The Lackawanna Steel Company has taken a contract for 15,000 tons of rails for Cuba. The Grand Trunk Pacific has placed its large orders for rails in Canada, 22,000 going to the Algoma Steel Company at Sault Ste. Marie and 15,000 tons to the Dominion Steel Company at Sydney.

In pig iron, sales in the West have not been large but an increasing quantity of foundry iron is reported taken in Eastern territory. There is also a better demand for basic pig. Southern iron has secured the majority of the foundry orders and the furnaces there being fairly well supplied with orders for the present, are holding prices a little more firmly.

United States Steel Corporation—At the annual meeting, April 19, the directors whose terms then expired were all re-elected as follows: William Edenborn, Henry C. Frick, William H. Moore, Norman B. Ream, James H. Reed, Charles Steel, P. A. B. Widener, Robert Winsor. Alfred Clifford was also chosen a director to succeed James Gayley, resigned.

Baltimore

April 20—Imports for the week included 21 tons spiegeleisen and 1125 tons ferro-manganese from Great Britain; 13,150 tons manganese ore from India; 5150 tons iron ore from Cuba.

Birmingham

April 19—The pig-iron market condition in the Southern territory is looking up. The quotations are firm around \$11.50 per ton, No. 2 foundry. If there is any iron being sold now under that price very little is being said about it. The shipments out of the district and the home melt require considerable iron and there is not a great accumulation. While no large sales have been made in the last few days there have been a few orders taken in and a number of inquiries received that give encouragement.

The steel plant of the Tennessee company, at Ensley, will produce something like 1000 tons of rails a day on an export order this week. Other orders are said to be in sight which means that there may be no necessity of shutting down the big plant.

The trustees of the Quinn Furnace Company, which owns a 75-ton charcoal furnace at Attala, Ala., sold the property this week at public auction. There were no incumbrances on it. The Shelby Iron Company has one furnace in operation making charcoal iron.

Chicago

April 19—Sales of pig iron are increasing, with the general betterment of business and the realization by melters that prices are not likely to go lower. But improvement is as yet spasmodic; it shows waves of activity and dullness. The best index of market conditions seems to lie in prices. Southern iron now holds firmly to \$11; on some sales it is \$11.50. Birmingham, these prices representing \$15.35 and \$15.85, Chicago, respectively. Occasionally a large purchase is made for current needs and those of the third or fourth quarters, but for the most part business

continues to be of the small-lot, quick-delivery variety.

The average consumer of pig iron is having his confidence quietly restored. But he will not as yet invest heavily in the future. His needs as regards Northern iron are steady, but small, and Northern remains constant at \$16.50@17. Lake Superior charcoal, with a steady demand and well-regulated supply, is firm at \$19.50.

Sales of iron and steel products continue to show a fair increase. Coke is stationary, with light sales, the best Connellsville bringing \$4.70@4.85, Chicago.

Philadelphia

April 21—Pennsylvania makers have begun to find customers for small lots of iron for early delivery. All efforts to secure long contracts have failed. Southern makers are evidently shading still farther; a number of recent orders here have gone South, two or three to Virginia furnaces. The local demand is perceptibly better, but the sales are small and for pressing requirements. Generally speaking, the tone of this market is better.

Steel Billets—The usual hand-to-mouth business is reported, with prices tending to a lower level.

Bars—Mill trade less active than a week ago. Stores report a moderate improvement in retail demand.

Sheets—The sheet mills have succeeded in gaining considerable business for early summer delivery, but at buyers' prices.

Pipes and Tubes—All kinds of pipe work are doing better.

Plates—The balance of uncompleted work at most mills is getting rather low. Local demands just at present cut a small figure.

Structural Material—A large amount of work has been placed in Pennsylvania mills, the bulk of business for Eastern construction requirements going to mills in the western end of the State. An improvement is noted within a week in demand for local building needs.

Scrap—Millmen and others have made purchases of heavy scrap. Foundries are making inquiries. Scrap dealers are feeling better.

Pittsburg

April 20—Favorable prospects are still indicated in the iron and steel trade by increasing orders for nearly all lines of finished products. These orders are for small tonnages, but the aggregate is large and production at a number of plants in the Pittsburg and surrounding districts has been greatly increased. The Carnegie Steel Company is operating more mills at its Homestead and Duquesne works than last week. New business in wire and wire products is still confined to small tonnages as the expected readjustment in prices by the American Steel and Wire

Company has not been announced. In the meantime other producers are said to be seriously shading current quotations, particularly in nails. The National Tube Company continues to book new orders for merchant pipe and is running its plants in the Pittsburg district at around 80 per cent. Spang, Chalfant & Co. have taken an order for 20 miles of 12-in. pipe. As announced two weeks ago, the Republic Iron and Steel Company will build a large tube plant. Details were officially given out during the past few days. The works will be built by the Haselton Steel Company, which was formed by interests connected with the Republic company, and the pipe concern will be operated as a subsidiary company. Additional pipe mills are to be built by the Youngstown Sheet and Tube Company.

In tinplate contracts at current prices are being made for delivery all year, but in sheets present prices will not be accepted for delivery beyond July 1. Rail buying continues slow. Reports that a reduction in the price of steel rails is under consideration are not credited here.

The structural-steel trade is quiet owing to the great irregularity in prices. Some new business has been offered and rejected by fabricators on account of the extremely low rates named. There are several good contracts being held up because of the uncertainty regarding prices. Prices in plates and steel bars are weak, as considerable shading has been done lately. It is reported that the Steel Corporation took a large contract for plates from a concern that had been supplied by the Jones & Laughlin Steel Company by naming a low price. In retaliation, it is reported, the Jones & Laughlin company has been quoting steel bars \$2 per ton under the established rate.

Pig Iron—No sales of any consequence have been made for over a week. Quotations, which are purely nominal, are as follows: Standard bessemer, \$14.75@15; malleable bessemer, \$14.50; basic, \$14.25@14.50; No. 2 foundry, \$14@14.25; gray forge, \$13@13.25, all f.o.b. Valley furnaces.

Steel—There are reports of shading of the established price of \$23, Pittsburg, on bessemer and open-hearth billets, but shipments are on sliding-scale contracts. Merchant-steel bars are quoted at 1.2c, but sales are being made at 1.1c, but not for delivery beyond July 1. Plates are still quoted at 1.3c, but this rate is not firmly maintained.

Sheets—The sheet market continues satisfactory, and prices are firm. It is not possible to contract beyond July 1 for sheets at present prices. Black sheets are quoted at 2.25c on large tonnages, and 3.25 for galvanized, No. 28 gage.

Ferro-manganese—The market is stronger owing to a couple of large sales for delivery in the West. The latest quotation is \$45 Pittsburg.

Foreign Iron Trade

German Iron and Steel Trade—Exports and imports of iron and steel and of machinery in Germany, two months ended Feb. 28, metric tons:

	Exports.	Imports.	Excess.
Iron and steel.....	556,903	69,368	Exp. 497,535
Machinery.....	46,087	9,852	Exp. 36,235
Total.....	602,990	66,220	Exp. 536,770
Total, 1908.....	609,604	93,653	Exp. 515,951

Decrease in exports this year, 6614 tons, or 1.1 per cent.; in imports, 27,433 tons, or 29.3 per cent. Imports of iron ore for the two months in 1909 were 1,050,580; exports, 438,749 tons. Imports of manganese ore, 48,373; exports, 370 tons.

German Steel Syndicate—Sales of the German Steel Syndicate for the two months ended Feb. 28 were 224,743 tons billets and other half-finished material; 325,928 railroad material; 256,156 shapes, plates, etc.; total, 806,827 metric tons, an increase of 323 tons over last year.

Metal Market

New York, April 21—The metal markets generally show little change since our report of last week. Some improvement is noted, but it is of gradual nature.

Gold, Silver and Platinum

UNITED STATES GOLD AND SILVER MOVEMENT

Metal.	Exports.	Imports.	Excess.

Exports from the port of New York, week ended April 17: Gold, \$550,100, chiefly to Brazil; silver, \$856,016, to London and Paris. Imports: Gold, \$181,093; silver, \$28,947, from Central and South America.

Foreign trade of the United States, three months ended March 31, as valued by the Bureau of Statistics, Department of Commerce and Labor:

	1908.	1909.
Exports.....	\$ 515,499,899	\$ 421,967,296
Imports.....	258,863,772	355,649,324
Excess, exports.....	\$ 256,596,127	\$ 66,317,972
Add excess of exports, silver.....		4,020,712
Add excess of exports, gold.....		25,820,357
Total export balance.....		\$ 96,159,041

The gold and silver movement is given in the table at the head of this column.

Gold—The price of gold in the open market in London was unchanged at the usual level. The Bank of France, after a suspension of buying for several weeks, this week took all the Transvaal gold arriving. In New York \$250,000 were taken for export to Amsterdam and \$500,000 for Brazil.

Platinum—Dealers' prices are unchanged at \$23@24 per oz. for refined platinum; \$26 for hard metal and \$10@21 for scrap

Business is improving a little and sales are much better than at this time last year.

Silver—Owing to China and speculative buying silver has had quite a sharp advance. While the buying has not been aggressive, it is estimated up to the present time for the year shipments of over £925,000 have been consigned to China; and it is worth while noting that this amount in 3½ months is larger than the total shipment to China in 12 months of any year since 1900.

London quotations are per long ton (2240 lb.) standard copper. The New York quotations for electrolytic copper are for cakes, ingots and wirebars, and represent the bulk of the transactions made with consumers, basis, New York, cash. The price of cathodes is usually 0.125c. below that of electrolytic. The quotations for lead represent wholesale transactions in the open market. The quotations on spelter are for ordinary Western brands; special brands command a premium.

Copper—The market has been quiet and featureless since April 14. The European buyers are well covered and on that account are not placing orders for the time being. Some business is being done in the home market from day to day, but the transactions are not large. Lake copper has been freely sold at 12½c. for good ordinary brands, while some special brands have fetched 13c. All of the selling

agencies are freely offering electrolytic copper at 12¾c. delivered, 30 days, equivalent to a little less than 12½c., cash, New York, and most of them make concessions of a few points to consummate business. The close is unchanged at 12½@13c. for Lake copper; 12½@12¾c. for electrolytic copper in ingots, cakes and wirebars. The average of the week at which business in casting copper has been done is 12½@12½ cents.

Copper sheets are 16½c. base for large lots. Full extras are charged, and higher prices—up to 18c.—for smaller quantities. Copper wire, 14¾c. base, carload lots at mill.

The volume of business on the London Metal Exchange in standard sorts has dwindled down considerably, and the market has been slightly reactionary. The close is barely steady at £57 2s. 6d. for spot, £57s. 17s. 6d. for three months.

Statistics for the first half of the current month show an increase in the visible supplies of 800 tons.

Refined and manufactured sorts we quote: English tough, £62; best selected, £61@62; strong sheets, £73@75.

Exports of copper from New York and Philadelphia for the week, 387 long tons. Our special correspondent gives the exports from Baltimore at 1482 tons copper.

Stocks of copper in England and France on April 15 are reported by Messrs. Henry R. Merton & Co., of London, at 52,190 tons, an increase of 840 tons over March 31. The stocks include 8500 afloat from Chile and Australia.

The North Butte company in 1908 produced 36,929,028 lb. of copper, for which it received an average of 13.33c. per lb. This copper is sold by the United Metals Selling Company and is paid for on the basis of the average sales of that company during the third month following receipt of the ore. The North Butte was shut down during January and February, 1908. The quotational average for the 10 months corresponding to its settlements was 13.31 cents.

Tin—The London market has ruled somewhat firmer throughout the week. The favorable statistical position is given as the cause of the strength, but some talk about levying a duty on tin in this country, which resulted in speculative purchases of prompt material from this side, has, no doubt, added its share toward the advance. London closes at £136 12s. 6d. for spot, £134 15s. for three months, and the domestic market at about 29½ cents.

Arrivals of Bolivian tin in Europe in March are reported at 19 tons bars and 3100 tons concentrates; the whole equivalent to 1879 tons metal.

Lead—The inquiry for this metal from consumers continues to broaden, and a good-sized business has taken place from

day to day. Prices have gradually advanced and the market closes firm at 4.10 @4.15c. St. Louis, 4.20@4.25 New York.

The London market is soft and the close is cabled at £13 2s. 6d. for Spanish lead, £13 5s. for English lead.

Spelter—Galvanizers have placed large orders, due to an improvement in their business, and also in anticipation of the pending tariff legislation. On account of the uncertainty of an adequate ore supply, due to this tariff legislation, smelters have been very cautious in disposing of their metal and prices easily advanced. The close is firm at 4.92½@4.95c. St. Louis, 5.07½@5.10 New York, for prompt and early deliveries, but sales for future delivery have been made as high as 5c., St. Louis.

Quotations for spelter in New York April 15 were 5@5.02½c.; 16, 5.02½@5.05c.; 17, 5.05@5.07½c.; 19 to 21, inclusive, 5.07½@5.10 cents.

The London market is steady, good ordinaries being quoted at £21 12s. 6d., specials at £21 17s. 6d. per ton.

Base price of sheet zinc is now 63½c. per lb., f.o.b. La Salle-Peru, Ill., less 8 per cent. discount.

Upon application of Alton B. Parker, acting on behalf of the Trust Company of America, trustee for the bondholders, J. O. Rogers had been appointed receiver for the Lanyon Zinc Company. The petitioners declared that \$1,783,000 of the company's bonds are still outstanding, on which there has been a default of interest amounting to \$483,000, part of it due since 1905. This company was organized in 1899, was greatly over-capitalized, and never has been able to make a respectable showing on its stock, but up to a few years ago, succeeded in paying interest on its bonds. It is said that the receivership will not interrupt the operation of the company.

Other Metals

Antimony—There has been more buying than for several weeks, the activity being due to the expectation that a duty will be imposed on the metal. Prices are higher, 8½c. per lb. being paid for Cookson's; 8¼ for Hallett's and 7½@8c. for U. S. and other brands.

Aluminum—No. 1 ingots are still 22@24c. per lb., base price; wire, 31@32c. and sheets 33@34c. base. Business has been moderate, with no special features.

Quicksilver—Business has been rather quiet. New York quotations are lower, at \$44.50 per flask of 75 lb. San Francisco nominal, at \$44 for domestic and \$42 for export. London price is unchanged at £8 7s. 6d. per flask, with 5s. less asked by second hands.

Nickel—Large lots, contract business, 40@45c. per lb. Retail, spot, from 50c. for 2000-lb. lots up to 55c. for 500-lb. lots. The price for electrolytic is 5c. higher.

Cadmium—Current quotation 75c. per lb., in 100-lb. lots, at Cleveland, Ohio.

Magnesium—Quotations for this metal are \$1.25 per lb., New York, in 100-lb. lots; for 5-lb. lots, \$1.40 per pound.

Zinc and Lead Ore Markets

Joplin, Mo., April 17—The highest price reported paid was \$41.62 per ton, the assay base ranging from \$38 to \$39 per ton of 60 per cent. zinc, with some ore high in iron selling on a base of \$40. Zinc silicate sold at \$17.50@19.50. The average price, all grades, was \$36.50. Lead sold as high as \$58 on a base ranging from \$56 to \$57. The average price, all grades was \$54.90 per ton.

The upward move in spelter had an immediate effect on the ore market, already on a nervous tension, and prices were advanced all along, from the cheapest silicates to the best blende ore. There was an average gain in price of 60c.; some ore purchased for next week's delivery was advanced as much as \$2 per ton.

NOTE—Under zinc ore the first two columns give base prices for 60 per cent. zinc ore; the second two the average for all ores sold. Lead ore prices are the average for all ores sold.

Lead continues to advance a little each week, and the upward price has put upon the market several million pounds of reserve ore this month.

Platteville, Wis., April 17—This week the base price paid for 60 per cent. zinc ore was \$38.50 per ton; this was the highest price paid this week. For 80 per cent. lead ore, \$51 was paid; one choice car brought \$53 per ton.

SHIPMENTS, WEEK ENDED APR. 17

Year to Apr. 17	29,843,524	907,460	2,736,660

In addition to the above there was shipped to the American Zinc Ore Separating Company, 111,140 lb. and to the Joplin Separator Works, 417,390 lb. zinc concentrates.

Chemicals

New York, April 20—The market is quiet, with little change from last week's report.

Copper Sulphate—No large sales reported. Prices unchanged at \$4.60 per 100 lb. for carload lots, and \$4.85 per 100 lb. for smaller parcels.

Arsenic—Quotations for white arsenic are 2½@3c. per lb. Sales about 50 tons for the week.

Nitrate of Soda—Current sales are light. Prices are a shade lower, at 2.12½@2.15c. for both spot and futures.

Mining Stocks

New York, April 21—A slight reaction early in the week brought about some liquidation. Aside from this, the general stock market has been strong throughout the week. Prices have held up well, especially in the industrial stocks, United States Steel being a leader in the movement. At the close of the week the Steel strength was helped by the hopeful statements made at the annual meeting on April 19.

A sale of Homestake, of South Dakota, was recorded, at \$94.50 per share.

The directors of the Amalgamated Copper Company, on April 15, declared the usual quarterly dividend of ½ per cent. This action was generally expected.

On the Curb the course of the general exchange was followed rather closely. Early in the week there were some declines in the copper stocks, but these were recovered. At the close prices are a little irregular, but generally strong. Nevada Consolidated was the most active stock and realized a good advance.

It may be noted that the market was sustained throughout by a good buying movement on London orders.

Boston, April 20—The mining-share market has been one of specialties and as a rule price changes are without significance. North Butte made a low record at \$60.25, which represents a decline of over \$20 from the high of the year. Amalgamated shows slight net change as the result of the week's operations.

Boston banks have the largest amount of deposits in their history, some \$197,100,000, which is certainly not a bear argument so far as the stock market is concerned.

The real feature has been U. S. Smelting, Refining and Mining. As a result both the common and preferred shares are much higher, the former \$6.75 at \$46.75 and the latter \$2.50 at \$47. Late discords in the management have been dispelled by the acquirement of R. D. Evans' holdings of some 60,000 shares of common and 40,000 shares of preferred at an average price of \$50 per share for each. The late weakness in Utah Consolidated is now made clear by announcement of the resignation of James Phillips, Jr., from the board of directors. He is succeeded by Sidney Chase of this city.

Southwestern Development has been the Curb feature, advancing from under 20 to 90c, during the week. Speculation has been very active in this issue. Davis-Daly displayed a firmer tone on the final payment of the \$2 assessment.

Modern Silver-Lead Smelting at Laurium, Greece

The Mines Supply a Self-Fluxing Mixture Carrying 11 Per Cent. Lead.
Twelve Castilian Furnaces Supplanted by an American Blast Furnace

BY HENRY F. COLLINS*

The metallurgical treatment of the ores found in the mines of Laurium, including the smelting of lead ores, was briefly summarized by me in an article published in the JOURNAL, Feb. 23, 1905. Since the date of my visit, the comparatively low tenor of the ores in lead and the high volatilization losses always experienced with the old-fashioned Spanish type of blast furnace have induced the French Laurium Mines Company to radically reform its methods and modernize its smelting works.

The total quantity of material smelted annually at the works of the French company, is about 90,000 tons, of which from 7000 to 8000 tons are galena concentrates, carrying about 50 per cent. lead, the re-

table is taken. The deposits of lead ore in the Camareza section of the district include both galena and oxidized ore, oxidized ore predominating. The gangue is generally calcareous or ferruginous—occasionally, however, silicious; the principal associated minerals are calcite, limonite, aragonite, selenite in very fine crystals, a little calamine, and occasionally small quantities of various copper minerals and the rare minerals, adamite, serpierite and buratite.

The ores of Souréza in the southern part of the district are chiefly galena (with some lead carbonate) and zinc carbonate, in a gangue of calcspar and fluor-spar—sometimes as much as 30 per cent. of the latter—with very little iron or

pyrite. An average composition for large masses of this ore would be 10 per cent. lead, 12 per cent. zinc and 15 per cent. iron, in the form of pyrite, in a gangue of quartz and calcite which is generally more or less mixed with chalybite and carbonates of manganese. The better grade of sulphide ore is smelted direct, but the zinky silicious and more pyritous sulphide ores are first concentrated.

The smelting furnaces were formerly of the old Spanish type, circular masonry furnaces, 4 ft. 6 in. in diameter provided with 4 water-cooled tuyeres, and furnished with blast at 6 to 7 oz. pressure; the column of charge extended at most only 9 ft. above the tuyere level. There were 12 of these furnaces and each

mainder being oxidized ores with an average of 10 to 11 per cent. lead and considerable amounts of zinc and alumina. From a metallurgical point of view the most favorable feature of the ores available is that they contain high proportions of the carbonates of lime and iron with some manganese, so that it is easy to obtain a self-fluxing mixture, barren flux never being required.

VARIOUS ORES OF THE DISTRICT

Analyses of some of the principal ores of the Laurium district were published in my article in the JOURNAL, Nov. 10, 1904, from which the accompanying

silica. In bulk they run about 10 to 12 per cent. lead, with an average of 10 oz. silver per ton. In view of the considerable percentage of galena, it is somewhat remarkable that the ores contain no blende, the 10 to 12 per cent. zinc present being all in the condition of carbonates.

In the Plaká portion of the Laurium district, both carbonate and sulphide ore are found together with manganese and manganiferous iron ore. The mixed sulphide ore resembles that of Leadville rather than that of Broken Hill, in that the proportion of iron pyrite is considerable. In some of the Plaká ore the carbonates of iron and manganese predominate over the quartz, while the galena is found practically free from blende and

smelted about 25 tons of charge per day with a fuel consumption of 17 per cent. by weight of coke. The loss of lead by volatilization was 2 to 2½ per cent. of the charge, or from 20 to 25 per cent. of the total quantity of lead present. Owing to the low temperature of the smelting zone, the slow rate of smelting, and the high reduction, great trouble was experienced through accretions both in the hearths and in the shafts of these old-fashioned furnaces.

THE NEW BLAST FURNACE

The new furnace is of the American type, now standard for large installations all over the world, and handles from 250 to 300 metric tons per day. It measures

156x44 in. at the tuyeres and 20 ft. 4 in. from tuyere level to feed floor, and was built by the Colorado Iron Works Company, although certain important alterations in details have been made on the spot subsequent to the delivery of the furnace. Fig. 1 shows longitudinal and transverse sections of the forehearth, the former also showing part of the furnace. The crucible rests upon the usual sheet-steel bottom plate and is enclosed in mild steel plates with strengthening I-beams, the ribbed cast-iron plates supplied originally for the short ends of the curb having to be replaced almost immediately. The crucible is built as usual of firebrick, inside which is a lining of a special chrome-magnesia brick containing 3 parts of burnt magnesite to 1 part of chromite, this being necessary on account of the spess made here rapidly corroding all ordinary firebrick, whether silicious or basic, having, however, but little effect on those made of the above mixture.

The water jackets are of mild steel plate 5/16 in. thick outside and on the fire side 7/16 in. thick. They are 7 ft. high, the water space measuring 4 in. in width. There are in all 8 side jackets and 2 end jackets; the two central side jackets on each side of the furnace are provided with 3 tuyeres and the two outer ones with 2 tuyeres each, making altogether 10 tuyeres on each side provided with convenient independent tuyere-valves. As at first sent the tuyere pipes were fastened into the jackets like boiler flues in the usual way, namely, by expanding against the orifice cut in the inner jacket plate and beading over the edges, but trouble was experienced from leakages, and recently welding the end of the tuyere pipe to the inner jacket plate by means of the oxy-acetylene blowpipe, has been adopted, an improvement which has resulted in the elimination of all leaks.

Fig. 2 shows side by side the inner plate of two jackets one of which has the tuyere pipes "beaded" in the usual way, the other having been welded by means of the oxy-acetylene blowpipe. Sea water is used for cooling and saline deposits are entirely avoided by circulating a quantity of water sufficient to keep the temperature of the effluent at or below 50 deg. Centigrade.

STRUCTURAL FEATURES

The brickwork forming the furnace shaft is supported on brick arches turned from abutments formed of L-shaped steel castings, bolted to the tops of four mild-steel columns and strengthened mutually by means of heavy tierods running both longitudinally and transversely. Upon these arches the shaft is built as usual of ordinary red brick with a one-brick lining of firebrick, the total thick-

Doubling the weight of the charges has been tried but has not given satisfactory results, the amount of accretions appears to be increased and the working becomes irregular.

Blast is supplied by either of two Root's blowers, each of which can deliver 10,500 cu.ft. of air against a pressure of from 35 to 40 oz. The blast enters the furnace through 20 tuyeres, measuring 4½ in. in diameter but provided with thimbles of 3½ in. interior diameter; each tuyere has the usual Davis slag-escape and a separate brass tuyere valve. The blast-gate on the bustle-pipe is operated by means of a chain and a weighted safety-valve opens automatically as the gate-valve closes.

CONTINUOUS SLAG FLOW

Special attention may be directed to the arrangements for handling matte and slag, one interesting feature of which is the employment of a forehearth having a constant flow of slag without a trap spout. The whole of the molten products leave the furnace at one end through a tapping jacket, made of high-grade phosphor-bronze with 98 per cent. copper and the minimum aperture of which is 2¼ in. in diameter. Exactly opposite the center of this aperture a long water-cooled plug is held in glands hanging from fixed supports in such a way that it can be pushed in or drawn out at pleasure, thus restricting or enlarging the area of the annular ring left between its rounded point and the tapered hole in the tap-jacket through which the molten products of the furnace issue. The plug is a steel tube with rounded point made of wrought-copper. The details of its construction may be seen in Fig. 4.

By entering or withdrawing the plug, irregularities in the slag-flow caused by variations in the speed of smelting or in the pressure of blast are controlled with great exactitude, so that neither do the tuyeres become slagged, nor is there any escape of blast at the slag-spout. It seems probable that only a fusible lead slag of nearly monosilicate composition could be successfully handled in this way, and that difficulties might be experienced in handling the more viscous bisilicate slags used in copper smelting with this ingenious appliance which, however, answers perfectly under the conditions prevailing at Laurium.

The forehearth, shown in Fig. 1, is rectangular, its longest axis being placed crosswise at right angles to that of the furnace. The casing measures 10 ft. x 6 ft. 6 in. x 4 ft. 6 in. deep, and is lined with one course of the chrome-magnesia brick similar to those used for the crucible; the capacity of the forehearth is approximately 30 tons of slag. The molten products issuing from the tap jacket enter the forehearth by means of a

FIG. 2. OLD AND NEW TUYERES

ness tapering from 3 ft. to 2 ft. 8 in. at the top.

Above the feed floor, connection is made with a fixed hood and chimney supported from the roof of the furnace building by means of a movable charging hood running on wheels transversely to the longer axis of the furnace and provided with four counter-balanced doors on each side. These are opened by the side-dumping charge cars in the act of delivering their contents and close automatically. The ore charge is trammed in 8 small side-dumping cars holding 600 kg. each, or a total of 4800 kg., half of which is dumped from each side of the furnace. The coke charge of 624 kg. is trammed in 4 side-dumping cars of double the length of the ore cars so that each opens two of the furnace doors in the act of delivering its contents. Like the ore charge it is dumped simultaneously from both sides of the furnace.

water-cooled copper spout, 7 ft. 6 in. long, made in two pieces as indicated in the longitudinal section, Fig. 1, details of its construction being shown in Fig. 3. The cast-iron spouts at first adopted, even when lined with magnesia brick, became readily perforated by the hot matte and speiss. The present construction of thick copper plate, with no joint or rivet on the surface exposed to heat, is found to be necessary in order to avoid perforation and possibility of leakage with consequent liability to dangerous explosions.

HANDLING THE FURNACE PRODUCTS

The matte and speiss are tapped together from the forehearth usually once in 24 hours and run into one of two tap-

stream is diverted to the other, and the first is allowed to drain for 5 or 10 minutes by means of a perforated section at the bottom immediately above the valve after which the valve is opened by means of a hand-wheel on the pinion shaft and discharged into a wagon holding 8 tons. Two men per shift suffice to handle the slag from the furnace when smelting 300 metric tons per day, besides breaking up and loading all the matte and speiss produced.

The lead overflows from the lead well of an Arent's siphon-tap into one of two steel drossing pots holding 2500 kg. In these it is drossed and tapped at intervals into the usual half-circle of molds on wheels. The accompanying table shows the composition of some of the

with them since adopting this type of furnace.

With a fuel consumption of 13 per cent. of coke, the furnace puts through from 275 to 300 metric tons per 24 hours of a self-fluxing charge carrying about 11 per cent. lead, of which 90 per cent. is recovered. The somewhat aluminous and zinky slags contain from 0.7 to 0.9 per cent. lead. The whole of the work around the furnace takes only 36 men per 24 hours or 12 per shift, namely, 4 on the lower floor and 8 on the charging floor. The labor cost amounts to only 24 to 26 c. per metric ton of material handled. The substitution of this modern furnace for the old type formerly in use has resulted in great savings in every direction, particularly as regards loss of lead, labor cost and fuel consumption.

For the details here given and for the accompanying drawings, I am indebted to L. Guillaume, chief engineer in charge of the ore-treatment plants of the French Laurium Mines Company and to whose initiative is due the installation of this modern plant, as well as the credit for the successful results obtained.

Direct Cyaniding on the Rand

pits placed at the side of the furnace opposite to the lead well. The slag may leave the forehearth by either of the two water-cooled spouts on opposite sides, and falls into a cast-iron launder where it meets a stream of water issuing under pressure from a flattened nozzle, the whole of the cooling water from the furnace and tap-jackets, etc., being also utilized in this connection.

The slag is broken up by the powerful stream into granules, the largest particles of which do not exceed 2 mm. in diameter; the average being only 1 mm. Each launder discharges into a sheet-iron hopper, capable of holding 8 tons, and furnished at the point with a flat slide valve moved by a rack and pinion. These hoppers take alternately the whole stream of slag and water, the latter overflowing at one side while the slag accumulates. When one is full the

furnace products. Two partial analyses of shaft accretions are here given but comparatively little trouble is experienced

To omit amalgamation altogether in treating Witwatersrand gold ores seems to be a revolutionary step, but it is now seriously proposed. H. H. Johnson, manager of the Village Deep, has won credit by publicly advocating the introduction of a direct-cyaniding, non-amalgamating system of gold recovery for the Rand. From a somewhat different standpoint the idea was put forward by the Denny brothers some years ago. To indicate how strongly the proposal has taken root, it may be mentioned that experiments are now proceeding at the Wemmer mill to prove the economy of the abandonment of the copper plates, while the Bantjes plant has been designed to include shaking tables only below the tube mills and to allow for their omission altogether, if trials elsewhere prove successful. Mr. Johnson's scheme, which is destined to be warmly criticized, involves the retention of gravity stamps, to each 10 of which will be installed a mill of the Chilean type. The mortar boxes will be fitted with screens of 3/4-in. mesh, and the Chilean mills 200 to 300 mesh. Tube mills will be used below the latter, so that apart from the rock breakers there will be three distinct units for ore reduction. Chilean mills have been tried on the Rand without success, but Mr. Johnson claims that their failure was due to the wrong class of work to which they were put—on coarse rock from the crushers or concentrates from the stamps.

Legal Status of Works Producing Noxious Gases

Different Phases of the Smelter Smoke Problem in the United States; Expert Damage Board Suggested. Domestic and Foreign Legislation

BY CHARLES BASKERVILLE *

Every individual has the right to have the air distributed over his properties and habitation in its natural condition, that is, free from all artificial impurities.¹ In fact it may be stated that no one has the right to interfere with the distribution and amount of pure air which flows over another's land any more than he has to interfere with his neighbor's soil.² This right is strictly a natural one, and every use of property that causes an unwarrantable impregnation of the air with foreign substances to the detriment of another, is a nuisance, and actionable as such.³ The air must be as free and pure as can be reasonably expected.⁴

Based largely on the preceding, it is laid down broadly as a general rule in law that any act, omission or use of property which results in polluting the atmosphere with noxious or offensive gases or vapors, thereby causing material physical discomfort and annoyance to persons residing in the vicinity,⁵ or injury to their health or property,⁶ is a nuisance.⁷ This rule has

been supported by decisions in Delaware,⁸ Illinois, Kentucky,⁹ Missouri, Pennsylvania, Texas and Wisconsin.

WHAT CONSTITUTES A NUISANCE

The question as to what degree of impurity imparted to the atmosphere by one in the use of his property constitutes a nuisance, is one of fact, and is determined by the jury from the circumstances of each case.¹⁰ Injury is, of course, a question of compound facts. No precise tests may be given that are applicable to all cases. In the consideration of the surrounding circumstances of a case, the character and nature of the gas complained of is of prime importance,¹¹ and the times and periods of the generation of the gas, or the constancy and frequency of the annoyance, the extent of the injury or inconvenience caused,¹² and the nature of the business, its location,¹³ management and manner of construction,¹⁴ must all be taken into careful consideration.

To illustrate the last condition, a manufacturing business may be a nuisance because it is located in a residential or populous part of a city or county, whereas it should be located in a more remote locality;¹⁵ or a nuisance may arise merely from the faulty construction of a plant or from the negligent or improper manner in which the business is conducted and the works kept.

Although diminution in value is the proper element of damages and in some cases the actual measure of the nuisance,¹⁶ yet it has been ruled in New Jersey¹⁷ that mere diminution of the actual or rental value of a property is not sufficient to make a business a nuisance. According to common law, a sensible injury is only a visible injury,¹⁸ and in general it may be stated that injuries must not be dependent upon scientific tests to discover.¹⁹ Theoretical injuries furnish no ground for abatement,²⁰ and an injury to property must be irreparable to cause a court of equity to interfere to abate.²¹

VARIOUS STATE DECISIONS

It has been ruled in Connecticut²² that a manufactory which produces such unwholesome odors that the workmen of a neighboring manufactory are prevented from working therein, is a nuisance; and it has been given as a decision in Iowa, Kentucky, Massachusetts, New York, Texas and Vermont, that a noxious trade may be a nuisance even in a remote locality, providing it is located near a public highway and inflicts serious discomfort on people passing by. However, it has been ruled in Tennessee that such odors or gases must be really dangerous to public health and not merely offensive to certain individuals.

Odors which are carried a great distance by the wind and which are "unpleasant and objectionable," according to a decision handed down in North Carolina²³, is not sufficient ground for the interference of a court. Odors or gases must work some substantial annoyance or some material physical discomfort to maintain an action; this point is well supported by precedents. It has been decided in South

⁴Huckenstine's Appeal, *Penn. State Reports*, 70, 102; Rhodes vs. Dunbar, *idem*, 37, 275.

⁵Material discomfort to an adjoining property owner and his family, although there is no pecuniary loss, is a nuisance (Kirchgraber vs. Lloyd, *Mo. Appeals Reports*, 59, 59). It is not necessary that an owner should be driven from his dwelling, it is enough that the enjoyment of life and property has been rendered uncomfortable (Fish vs. Dodge, *American Decisions*, 47, 251; Catlin vs. Yale, *idem*, 54, 38, 567; Barnes vs. Bathorn, *Me. Reports*, 54, 132; Peck vs. Elder, *Sandford's N. Y. Reports*, 3, 126.) It is not necessary that the smell is unwholesome; it is enough that it renders enjoyment of life and property uncomfortable (Davidson vs. Isham, *N. J. Equity Reports*, 9, 189; Brady vs. Weeks, *Barbour's Supreme Court Reports*, New York, 3, 157; Catlin vs. Valentine, *Pringle's N. Y. Chancery Reports*, 9, 575).

⁶Use of a process in burning brick by which noxious gases are generated and wafted on the adjoining land, injuring and destroying the crops, is a nuisance such as will support an action for damages (Fogarty vs. Junction City Pressed Brick Co., *Kas. Reports*, 50, 478; *Pacific Reporter*, 31, 1052). Fact that injury is only occasional is immaterial (Campbell vs. Seaman, *N. Y. Reports*, 63, 588; *American Reports*, 10, 259; *Weekly Law Bulletin*, 31, 9). In Pennsylvania the operation of lead-smelting works causing injury to adjoining property and danger to health (Appeal of Penn. Lead Co., *American Reports*, 42, 534).

⁷For general rule, see Thompson's *Encyclopedia of Law*, 21, 491. For cases in point of rule, see *Gen. Digest*, subject *Nuisance*, sections 194-99.

⁸See *State vs. Wetherall, Harrington's Del. Reports*, 5, 487. It was ruled that smells need not be injurious, but merely offensive to the senses.

⁹In the case of Ashbrook vs. Commonwealth (Ky. Reports, 64, 139; *American Decisions*, 59, 616), it was ruled that it is alone sufficient that the odors are detrimental to comfort.

¹⁰Burnham vs. Hotchkiss, *Conn. Reports*, 14, 318; People vs. Davidson, *Cal. Reports*, 30, 379.

¹¹Stowe vs. Miles, *Conn. Reports*, 39, 426; Commonwealth vs. Miller, *Penn. State Reports*, 139, 77; Mulligan vs. Elias, *Abbot's N. Y. Practice Reports*, n.s. 12, 259.

¹²Stowe vs. Miles, *loc. cit.*; Dittmann vs. Repp, *Mid. Reports*, 50, 516.

¹³In the case of Roessler & Hasslacher vs. Doyle (Atlantic Reporter, 64, 156), it was ruled that the character of the neighborhood may be considered in determining the kind and degree of annoyance which will be regarded as a nuisance, and that it will not relieve the person who caused the annoyance from liability if the existence of the nuisance is proved.

¹⁴Fay vs. Whitman, *Mass. Reports*, 100, 76; Pennoyer vs. Allen, *Wis. Reports*, 56, 502; Evansville & C. R. Co. vs. Dick, *Ind. Reports*, 9, 434; People vs. Detroit White Lead Works, *Mich. Reports*, 82, 471; *Northwestern Reporter*, 46, 735; Boynton vs. Gill, *Roll's English King's Bench Reports*, 2, 416, 140.

Carolina²⁴ that where the plaintiff has sustained damage from the escape of noxious gases from the defendant's factory and also injury from other causes, the defendant is not relieved from liability for the injury he has caused.

Dust, smoke and cinders, even when accompanied by noxious gases, are not nuisances *per se*, but amount to nuisances, whether accompanied by noxious gases or not, if they cause injury to neighboring property to such an extent that its value is diminished, or if they so pollute the air as to cause inconvenience materially interfering with physical comfort and the enjoyment of the property (California, Connecticut, Illinois, Indiana, Kentucky, Maryland, Massachusetts, Missouri, New Jersey, New York, North Carolina, Ohio, Pennsylvania and Tennessee)²⁵. If smoke and its accompanying gases cause sickness or injury to health, an action for damages lies, even though the fuel producing the nuisance is necessarily used²⁶.

A DUCKTOWN SUIT

In the suit of the Ducktown Sulphur, Copper and Iron Company vs. Barnes *et al.*,²⁷ where smoke and noxious gases from a smelting works injured the property and endangered the health of the adjoining landowners, the action for damages lay, even though the business was being carried on in a suitable locality, with the most improved appliances,²⁸ and furnished employment to nearly the whole community. It was decided that it is no defense to an action for damages that there were similar establishments in the neighborhood before the plaintiff moved there²⁹; and that it is no defense that the works could not be operated without giving rise to noxious vapors. It was decided that the owner was entitled to recover all the damages sustained without reference to the incidental benefits or advantages to the land by reason of the market it afforded for timber and garden products.

The decision in the preceding would seem to indicate that no prescription can

be pleaded for a nuisance,³⁰ and that neither its collateral benefit to the community³¹ nor the good intent of the projector is a defense. It would appear that it is alone sufficient to sustain a conviction that the comfort of the community is impaired. However, the findings in some recent cases in Montana in part conflict with the aforesaid decisions and stand out in sharp contrast.

SOME MONTANA DECISIONS

In the suit of Hugo Magone vs. the Colorado Smelting and Mining Company *et al.*, in which the plaintiff sought \$20,000 damages and a permanent injunction for alleged damage to his land and crops through the action of tailings and tailings-waters, the prosecution attempted to demonstrate the cause of the damage by chemical analyses. The defense was based on the fact that the water carried mere traces of possible poisonous salts in solution, and that the soil, which was poor black alkali in nature, was not properly irrigated. Although damages amounting to \$1700 were awarded the plaintiff, the injunction was refused on the principle of the "greatest good to the greatest number."³²

One of the most extensive suits ever heard was the one brought by F. J. Bliss vs. the Anaconda Copper Mining Company and the Washoe Copper Mining Company. This suit involved the question of fumes, and was brought for a perpetual injunction. During the case, it was brought out that the Anaconda company pays more than half of the taxes of Deer Lodge county, where its smelter is located; about one-third of the taxes of Silver Bow county, where its mines are located; and with associated companies they are the principal tax payers in nearly every part of Montana. It was shown that the company had erected a stack 300 feet high and that, before the erection of this stack when they used several smaller stacks, claims for about \$340,000 were settled.

The injunction was refused for the same reason as in the preceding case. The amount of damages fixed by the master in chancery was small. A further hearing in the case has been ordered to ascertain if there is not some means of reducing the amount of arsenic in the flue dust, in order that a specific rule may be made which will afford future relief.³³

THE CONTRA COSTA CASE

In Contra Costa county, California,

²⁴Frost vs. Berkeley Phosphate Co., S. C. Reports, 42, 402; *Southwestern Reporter*, 20, 280.

²⁵Hyatt vs. Myers, N. C. Reports, 71, 271; Bareham vs. Hall, *Los Angeles Times*, 22, 116; Lee vs. Waterhouse, *idem*, 26, 761; Ward vs. Lang, *Jurist*, 35, 408; Jones vs. Powell, *Pulmer's English King's Bench Reports*, 539; for Penn. ruling, see *Pittsburg Reports*, 307, 49. In New York the Appellate Division has recently laid down the law that where the public benefit of the alleged nuisance is greater than the injury to private individuals, there shall be no conviction for maintaining a public nuisance. Under this decision, a company may use soft coal in a crowded portion of New York City or Brooklyn, thereby distributing soot and smoke without being amenable to the criminal law. Civil suits may be brought by property owners, however.

³²*Report Proc. Am. Min. Cong.* (Denver), October, 1906, 251.

³³THE ENGINEERING AND MINING JOURNAL, Jan. 30, 1909, p. 265.

where an ordinance was recently passed to regulate the distribution of noxious gases by smelting plants, the board of supervisors of the county have granted the companies involved 60 days time to install apparatus and appliances to prevent the nuisance. County ordinances of a similar nature may yet solve the problem in affected parts of the country, especially in the Western States. City ordinances usually afford little relief³⁴.

The doctrine that an industry or business erected in the vicinity of similar establishments could not become a nuisance in that locality, or that any exceptions should be made in favor of a business lawful in itself and useful in its results, that is otherwise clearly a nuisance, excepting for the fact of location and usefulness, is generally considered to stand out of the pale of recognition of modern authority and to be entitled to no weight outside of Pennsylvania³⁵. However, some jurists, particularly in the western smelting districts where a broader view must necessarily be given to the matter, have rendered decisions which would seem to be contrary to this general rule.

OTHER LOCALITY CONSIDERATIONS

In the case of Dittman vs. Repp, the Supreme Court of Maryland held that in determining the question of nuisance from smoke or noxious vapors, reference must always be had to the locality. For instance, a party dwelling in a city in the midst of crowded commercial and manufacturing activities cannot claim the same quiet and freedom from annoyance that he might rightfully claim in the country.³⁶ When the population moves up to a nuisance which was previously in solitude, then as a general rule the nuisance must recede. It must, however, be reasonably offensive.

On its first introduction, gas was declared to be deleterious to the health of the community, and in some localities steam railways were at one time so offensive to particular local authorities, that attempts to prosecute them as nuisances were not infrequent.³⁷ Grievances of prosecutors in such cases as pertain to damaging gases in particular are often sentimental or speculative—just as they were at the time when the use of gas as

³⁴Let us take the regulations of the Health Department of the City of New York as an example. According to the Sanitary Code of this Department, Section 96, no person shall cause, suffer or allow offensive or noxious gases or odors to escape or be discharged to the detriment or annoyance of any person not therein engaged. Civil actions for the penalty of \$250 only are allowed (Section 1262, *Greater New York Charter*), and it requires a delay of one month in the issuing of an order to arrest a violator, during which time the nuisance continues. When the same is finally abated, the defendant to the action suffers no penalty and pays merely the costs. Jacoby (*Journ. Am. Med. Assn.*, 49, 815), in commenting on this section of the health code, remarks that the "laws, as usual, appear to be made not for the people but for their enemies."

³⁵Wood on Nuisances, 1, 726.

³⁶*Id.*, Reports, 50, 522.

³⁷Wharton's Criminal Law, article "Nuisances."

a fuel was regarded as a nuisance—without due regard to the substantiality of the "nuisance."

POPULAR MISCONCEPTIONS

Persons engaged in agricultural pursuits in manufacturing districts invariably have impressions of the destructive action of the waste gases resulting from fuel combustion, etc., upon vegetation, but these are generally founded on observation and tradition. There are many instances of sympathetic juries having fostered these impressions, basing their awards on miscellaneous general evidence and not upon scientific examination. In such cases, too much reliance is often placed on the appearance of individual trees and of isolated trees. Poor soil, exposure to wind, especially dry wind, water supply, insects, and fungi, all produce morphological conditions in vegetation which lead to the gravest misapprehensions in the minds of rural folk, and oft-times accusation of fumes and gases as the cause results, either wrongfully or on *a priori* grounds. Ordinary testimony based upon odor alone should as a rule carry little weight.³⁹

It is well known that the present sociological and political ideas which obtain in the rural communities, and certain abuses of the centralization of capital on the part of corporations have resulted in injuring the chances of the latter in suits of this nature. While it is true that certain corporations conceal their processes of manufacture, the nature and amount of materials used and the output of product, as well as employ other precautions in order to render the recognition of damage done by fumes more difficult, yet many instances are known where gardens are purposely set out with expensive flowers unsuited to the climate, just to profit by the damages for destruction by "noxious gases," and manufacturers are not protected from such malicious actions.⁴⁰

EXPERT BOARD TO ASSESS DAMAGES

Some time since I made the suggestion with the aim of justice in mind that complaints of this nature be settled by a commission composed of three experts in such matters, one being selected by each of the parties and the third being chosen by these

two;⁴⁰ or two of the experts may be appointed by the court, and a third selected by these two. Such a board of experts could investigate the facts of the case scientifically on the spot, and if damage has been done fix the amount and warn the offenders that a recurrence will bring forth more severe penalties. Negligence on the part of the manufacturers would cease, as well as annoying and expensive interruptions of business. Honest manufacturers would welcome such a change. It is recognized that such settlements would not be looked upon with particular favor by the legal fraternity, but it is interesting to note a recent case brought against the Mammoth Copper Company, in Shasta county, California, was settled by an arbitration board composed of three horticulturists, both parties to the suit having agreed to abide by their decision.⁴¹

In this connection it may also be remarked for the benefit of those who have not had occasion to investigate the matter, that there is not entire uniformity nor definiteness of statement in the codes of our several States in regard to the contamination of the air or the pollution of streams; cases have been described and citations given to substantiate this assertion. When such contamination becomes wretchedly bad from any cause whatever, protests sometimes check the wrong and secure legislation. The continued pressure of unsubsidized publicity often encourages direct action in these matters.

CASES OF FEDERAL JURISDICTION

When a manufactory in New Jersey generates gases which are complained of in New York or when smelter fumes produced in Montana or Tennessee affect the vegetation in a neighboring State, it becomes a Federal matter. In the latter case, we have also the same indefiniteness of statement in our laws.

General rules based upon precedents and not specific regulations obtain; the rule of action is not clear and there is a tendency toward a too technical construction of the law. Some have asserted that there is no need for legislation until there is a demand for it but the law of equity is not the outcome of specific needs and abuses of justice, but is rather contingent upon anticipated conditions; and manufacturers, as well as citizens, desire just protection. As in criminal law, it is to be deplored that cases may be lost in lower courts on judicial rulings which, in other similar cases, are afterward reversed by higher courts.

A Federal decision of great import was handed down in the case of the State of Georgia vs. the Tennessee Copper Company and the Ducktown Sulphur, Copper and Iron Company. The United States Supreme Court held that a State has the right to protect its forests and that a

company can be enjoined from operating its smelting works in such a manner as to cause damage to property in a neighboring State. It was held that a State has the right to protect its citizens when their property is subject to damage by operations in another State.

The interest involved in the United States is sufficiently great and distributed to make it appear advisable for the Department of Agriculture to extend its operations and investigations in this field, cooperate with the similar departments in the States, formulate reasonable legislation, and recommend the enactment of a uniform and definite law. In such an event the Government officials would undoubtedly receive the cordial support and encouragement of the owners of the industry. Such has been the case in England where there is in force a law defining what amounts of waste gases may be permitted in the air.

FOREIGN LEGISLATION

A brief discussion of the foreign laws of importance may not be out of place in this connection. According to Lord Derby's alkali act, the sulphate works of England were not permitted to discharge more than 5 per cent. of the hydrogen-chloride gas produced. This clause was later altered to forbid more than 0.464 gram of HCl per c.u.m. With regard to the sulphuric anhydride, the Alkali Works Amendment bill of 1901 prohibits the discharge of more than 4 grains of SO₂ per c.u.ft. of residual gas. The result of these laws has been a notable diminution of the amount of acid gases allowed to escape from works—a result not achieved by numerous prosecutions.⁴²

Until the beginning of 1907, the lead and copper smelting works in Great Britain were at liberty to discharge their fumes into the air as long as no objections were raised by persons nearby. Now these smelters are included in the new alkali works regulation bill. However, according to Walker,⁴³ the method of dealing with the existing smelting works is left somewhat elastic by the act. Contrary to the American law, the gaseous output could not be restrained up to 1907 if the population moved up to the works. This is exemplified by the history of Swansea, Wales. In Prussia, in the granting of concessions for new works it is enacted that the amount of sulphuric anhydride in the waste gases should not exceed 5 grams in one cubic meter.⁴⁴

⁴²*Am. Fertilizer*, 14, 12.

⁴³The ENGINEERING AND MINING JOURNAL, Sept. 21, 1907, p. 501.

³⁹Concerning the importance of disregarding this sort of testimony, see *Gloystine vs. Kentucky Commonwealth*, *Southwestern Reporter*, 33, 824; and *Walter vs. Selfe*, *English Law and Equity Reports*, 4, 13.

⁴⁰It is a general rule that any impregnation of the air with unnatural substances is a nuisance, irrespective of the nature and character of the property affected. See *Cooke vs. Forbes*, *Law Reports*, 5, *Equity Cases*, 166; *Gullick vs. Tremlett*, *Weekly Law Reports*, 2, 358. In the case of *Campbell vs. Seaman* (*N. Y. Reports*, 63, 568; *American Reports*, 20, 567), it was held that articles of luxury come under the protection of the court as much as articles of necessity. The judgment of the Supreme Court was affirmed by the Court of Appeals. Every man has the right to cultivate on his land such products as he chooses. See *Broadbent vs. Imperial Gas Company*, *De Gex, Moenaghten and Gordon's English Chancery Reports*, 7, 436; *Miller vs. Marshall*, *Murphy's Reports*, 5, 28.

UNIFORM FEDERAL LAW IMPRACTICABLE

An objection which has been urged against the regulation of the amounts of acid gases discharged into the air is this, that it is not practicable to establish a permissible amount of noxious gas which may be emitted for *all parts* of a country owing to geographical and meteorological conditions.⁴⁵ This is indeed well founded.

Other important questions to be considered in the formulation of a Federal law, such as referred to, are the enforced selected location for smelting works, etc., preferably on plains or level portions of the country, with due regard to winds, and the advisability of enforcing the adoption of tall stacks and chimneys by all works generating noxious gases. In regard to the first, it has been suggested that smelting companies be given the right to condemn land within a certain radius of their works, especially if they were located before the advent of a definite number of people. Such a bill passed the legislature of Utah but was disapproved in 1907 by Gov. J. C. Cutler on the ground that such a measure bore the marks of class legislation. The Utah bill provided for the condemning of land within a radius of four miles from a smelter in counties of less than 75,000 people.

As to the second question, the assumption that higher chimneys will diminish the amount of damage done by allowing the acid gases to become more dilute before reaching the vegetation is not realized, according to the experience of many industrial concerns. Notwithstanding the fact that unquestionable benefits are derived from dust chambers and the contrivances associated with high stacks, and the fact that the adjacent vegetation is not so much injured from a high as from a low stack, there is considerable damage wrought by gases from high stacks, as remote vegetation is reached by smoke, etc., which would not be otherwise affected.⁴⁶ In damp, heavy air, fumes heavier than air fall rapidly to the ground, and when the wind blows the gases sink gradually, but hold together for considerable distances, so that no unusual dilution is effected by such means.

RECLAIMING DEVICES

In conclusion, the main solution of the "fume question" and "air pollution" would seem to be in the enforced use of waste-reclaiming devices by the enactment of a Federal law regulating the amounts of waste gases to be permitted to pass into the air. In England the enactment of similar laws laid the foundation of the great chloride of lime industry, and the subject has received merited attention since 1863; in fact, one might say since 1836, the year

in which Gossage solved the problem of hydrochloric acid condensation.

In Germany, after extensive experiments in 1848 the furnaces in the smelting districts were remodeled and the volume of the dust chambers increased. This proved advantageous to the smelters, as the following shows: the Freiberg Smelting Works paid 55,000 marks for damage in 1864 and but 4793 marks in 1870, after installing means of condensing the acid gases.⁴⁷ In our own country it is encouraging to note that some manufacturers and smelters have at last begun the installation of waste-recovering contrivances—surely a decided step toward the solution of a great national industrial problem, however novel and radical such devices may appear. One large concern, the Tennessee Copper Company, contemplates the production of 300,000 tons of tower acid per annum from the gases delivered from its smelting furnaces, and no fear of trouble in disposing of the product is entertained by the officials.

The Fuel Question in California

SPECIAL CORRESPONDENCE

Rather an odd thing is happening in the matter of use of fuel for manufacturing, milling, etc., in California. Before the advent of oil as fuel, either wood or coal was used. At mills in the interior wood was largely used and also at mine furnaces. In the cities and towns manufacturers used coal. During a shortage of coal here shippers began to send in large quantities of coal from Australia and British Columbia and the market is now much overstocked because the cargoes continue to arrive, notwithstanding there is plenty of coal on hand. The result is that coal prices have dropped. Meantime the prices for fuel oil have much more than doubled and this in the face of the fact that there is an overproduction. Large quantities are being shipped abroad, as much more is produced than can be used on the Pacific coast. Still the oil continues to be used though the coal prices have fallen, and those of oil increased. A few years ago oil was bought from producers in the valley at 19c. per barrel by the large companies which distribute it. They did not add a very much higher rate for consumers and thousands of people put in oil-burning plants, giving up the use of coal entirely. The liquid fuel was cheaper, cleaner, did away with firemen, and permitted the user to regulate his desired heat closely. People have now got used to it and do not want to change back to coal again. And now the big companies owning the pipe lines, and distributing the oil, have raised the prices three or four times as high as when men

originally put in oil plants. Quartz mills throughout the State have big oil tanks to keep their supplies and have their boiler furnaces arranged for oil. They do not want to change any more than manufacturers do. All of this is fine for the big oil companies. Still some men are about changing. An instance in point is of one man who formerly bought 500 tons of coal monthly and for the past four years has been using oil. Now he is trying to make contracts for coal again, fearing that oil will go still higher in price, when it will cost him more than coal for his purposes.

The largest quicksilver mine in the State installed a fuel-oil plant, with tanks, etc., and hauled the oil in 45 miles by team. The increase in price has made this company go back to the use of wood again. The mine is in a forest reserve, and the company buys from the forest service all the wood it needs. The foresters mark the trees and the company cuts the wood, paying stumpage to the Government. The arrangement is found to be satisfactory and cheaper than the oil at present prices. It is acknowledged that the oil for roasting the cinnabar ores was an ideal fuel, because the heat could be graduated to a nicety, there was no smoke and the ores were roasted in the manner desired. With the wood, more men are necessary to feed the furnaces and the roasting is not accomplished so well. It seems, from these statements, that the people in California are in a sort of transition state in the matter of fuel. If the price of oil is still farther increased many will undoubtedly go back to using coal.

In sampling metals (*Aust. Min. Stand.*, Dec. 9, 1908) they should never be filed, as the abrasion of the file will add enough iron to the samples to affect the assay for that metal. This is true even of spelter, which is comparatively soft. Samples of metals and alloys should be obtained by drilling whenever possible. If the specimen is too small for drilling, it should be chipped with a sharp cold-chisel.

A shipment of 2500 tons of manganese ore from Caledon, South Africa, to Antwerp is reported by the *South African Trade Journal*. No further shipments will be made until the results of the treatment of this first cargo shall have been ascertained. In addition to its resources in ore of this quality, the mine is said to contain abundant ore of lower grade.

The *Queen. Gov. Min. Journ.* estimates the coal produced in New South Wales during 1908 at 9,147,025 tons, valued at £3,353,093, exceeding that of the previous year by 489,101 tons and £430,674 in value, and establishing a new record. In the course of 10 years the output has more than doubled.

The Coast District of British Columbia

SPECIAL CORRESPONDENCE

An interesting report, recently issued¹ by the Geological Survey of Canada, covers that portion of the coast of British Columbia lying between the international boundary and the mouth of the Powell river on Malaspina strait, including Burrard inlet, Howe sound, Jervis inlet and the adjacent islands. The greater part of this region had not been previously examined geologically. The present report is of a preliminary character, exploration being conducted only when the formations were of economic importance. The rocks of this region are largely of igneous origin, representing a great range from acid to basic in composition, and from volcanic surface flows to deep-seated plutonics—rocks of aqueous origin having a comparatively small distribution. The principal areas of economic importance are those occupied by the Paleozoic rocks, the mineral deposits occurring in them or along their contacts. The prospector has to contend with many difficulties in this coastal belt, the whole country being extremely rugged and difficult of access, while rock slides, a luxuriant forest growth and dense underbrush below the 4000-ft. level conceal the contacts and mineral outcrops. In most cases the discovered mineral deposits of value are so situated that economic methods in mining and transportation are feasible. Surface or aerial tramways may connect the mines with tide-water, and from there transportation is afforded to the smelters. The principal metallic ores are those of copper and iron.

MINERAL AREAS OF THE COAST DISTRICT

The report gives a detailed description of the known mineral areas grouped with reference to the inlets and islands. Lynn Creek camp, Burrard inlet, is about eight miles north of North Vancouver, and comprises an area of about five square miles, in which about 35 claims have been staked. The ores consist of zinc-blende, chalcopryite, pyrite, pyrrhotite, molybdenite and magnetite, which occur as irregular bodies along shear and fracture zones in the schists. The preliminary work done on these claims consists of stripping, small open cuts and tunnels, but in no case has sufficient work been done on any location to prove its value. On the Kemptville claims two veins of almost pure zinc-blende 2 ft. and 3 ft. wide, respectively, have been discovered, and on Angel claim No. 3 small bodies of yellow

low copper have been opened up. While some of the orebodies may prove of sufficient size to make them commercially important, in any case, owing to the cost of mining and transportation, it will be necessary to amalgamate the several interests to insure successful results.

BRITANNIA MINERAL ZONE

The Britannia mineral zone is situated on the east side of Howe sound, 23 miles from the entrance. The associated rocks belong to the Britannia group, consisting of conglomerates, quartzites, carbonaceous slates and quartz-sericite schists, with intercalated sills and masses of hornblende porphyrites and quartz-syenite porphyries. They have a width along shore of $1\frac{1}{2}$ miles and extend inland for more than 8 miles. The mineralized zone lies almost wholly in the quartz-sericite series. Iron and copper sulphides were deposited simultaneously with the development of the schist, during the eruptive after-action produced by the intrusion of the granite. A concentration took place in parts of the zone and lenses of massive chalcopryite with quartz were formed in parallel arrangement along the strike of the schist. These lenses range from an inch to several feet in width and are the source of nearly all the clean ore. About 70 claims have been staked along this zone and adjacent to it. The principal groups are controlled by the Britannia Copper Syndicate, Ltd., the Empress Mining Company, and the Goldsmith Copper Company. The Britannia Copper Company had mined and shipped up to Jan. 1, 1907, a total of 168,396 tons, of which 42,552 tons were shipping ore, and 65,841 tons concentrating ore, producing 12,612 tons of concentrates. The ore is essentially low grade and about 60 per cent. has to be concentrated before shipment for smelting. The company has an extensive plant, well equipped for the economical handling of the ore. At the mine the rock is first crushed at the head of the tramway and passed on a conveyor, where clean ore and waste are picked off. The Riblet automatic aerial tramway, 16,800 ft. long, connects the mine with the concentrator and shipping dock at the beach. The Britannia West Copper Company, whose claims also produce a low-grade ore said to carry appreciable values in gold and silver, were also installing a concentrating plant and building a tramway to the shore.

BOWEN ISLAND AND SEECHELT

The Bonanza mine on the southwest slope of Mount Gardiner, Bowen island, where a tunnel has been driven in for 300 ft., yields ore composed of pyrite, zinc-blende and galena, which carries also gold, silver and lead. On Jervis inlet deposits of pyrrhotite, chalcopryite and arsenopyrite, were found in several places, and some claims had been staked. Assays gave no traces of gold or silver

On Seechelt inlet, about three miles inland from the east side of the head of Salmon arm, at an elevation of 4500 ft. above the sea, the Granite Mountain Copper Company has 18 locations. The country rock is granite and the ore occurs in fissure veins which are nine in number varying in width on the surface from 3 to 25 in. The ore is massive bornite with a little chalcocite and cuprite in quartz gangue. An assay of massive ore gave 0.4 oz. gold, 35 oz. silver and 53 per cent. (wet) of copper. Should development prove the orebodies to be extensive, an aerial tram could be built to Salmon arm for the transportation of ore.

TEXADA ISLAND

On Texada island, which lies in the Strait of Georgia, its southeast end being 80 miles north of Victoria and 47 miles from Vancouver, copper has been mined for over a decade and the output has been characterized by a high percentage of copper with good gold and silver contents. The magnetite deposits have been known since the early sixties, but development work has been desultory and comparatively little ore has been shipped. The island is 30 miles in length and its maximum width is $6\frac{1}{2}$ miles. The western half of the island is more or less mineralized throughout, and has been nearly all staked at one time or another. The ore deposits occur in the Texada group and along the contact of that group with the Marble Bay limestone formation. In the Texada group the ores are found along shear and fracture zones in the basic eruptive rocks, and comprise galena, zinc-blende, chalcopryite and pyrite, carrying, as a rule, small amounts of gold and silver. The veins are from 2 to 4 ft. wide, in one case 12 ft., and from 20 ft. to over 300 ft. long. Of the contact deposits the most considerable are the occurrences of magnetite and copper on the property of the Puget Sound Iron Company, and those of copper at Van Anda. The former, situated on the southwest side of the island, outcrop along the southern flanks of a ridge parallel to the shore, occurring over an area of one mile in length by half a mile wide. About 15 distinct bodies are exposed along the contact of limestone with granite and the greenstone. The most important deposits are known as the Texada, Paxton and Lake mines. The ore of the Texada, where considerable development work has been done, is a coarse crystalline magnetite, which is locally impure from impregnations of copper and iron pyrites, some of the ore having carried as high as 3 per cent. copper.

A tunnel over 300 ft. long passed through 74 ft. of magnetite. At the Paxton the orebody is 320 ft. long, with a width of 240 ft., and a height of 92 ft. The Lake mine, one mile east of the Texada, has an orebody nearly 200 ft. long, 50 ft. wide and 70 ft. high in one locality. Little has been done in exploring other de-

¹Preliminary Report on a Portion of the Main Coast of British Columbia and Adjacent Islands included in New Westminster and Nanaimo Districts. By O. E. Leroy; pp. 56. Illustrated; paper; 3 1/2 x 6 1/2 in. Geological Survey of Canada, Ottawa, 1908. King's Printer.

posits beyond delimiting their boundaries superficially. Much of the ore now exposed would have to be roasted to free it from sulphur. Regarding the variable amounts of copper disseminated through parts of the orebodies it will probably be found that judicious selection would prevent the copper content in the roasted ore becoming high enough to vitiate materially the product for cast iron or steel. Several analyses are given showing iron contents of the ore ranging between 65.71 and 69.85 per cent. The total amount shipped probably does not exceed 20,000 tons, the greater part of which was smelted at Irondale, Wash. The deposits present good facilities for economic mining, principally by a system of quarries and tunnels. Closely associated with the magnetites is a series of copper deposits consisting of chalcopyrite and a little carbonate, occurring as small irregular bodies

silver. About 13,000 tons are mined and shipped annually. The mine is well equipped with a modern plant. At the Cornell mine the ore near the surface was rich, the product between the surface and the 160-ft. level being valued at \$270,000; some of the ore yielding 1.25 oz. of gold to the ton.

QUARRY AND LIME PRODUCTION

There are a number of quarries along the coast which furnish building stone and scrap for concrete and road metal. The limestones of Texada island are generally pure and when burned furnish a lime of excellent quality. The Tacoma Steel Company has two kilns on Limekiln bay on the northwest end of the island, which have an output of about 120 bbl. of lime per day. Very pure clays are found on the north arm of the Burrard inlet, at the head of Howe sound on the east side

The Tres Hermanas District

The Tres Hermanas mountains, south of Deming, N. M., and 10 miles north of the Mexican boundary line, were the scene of considerable activity in the early mining days of that State, lead being the principal metal produced at that time. In 1904, attention was attracted to a heavy, white, massive or crystallized material occurring plentifully in the old lead workings. This material was found to consist of carbonates and silicates of zinc. The zinc ores include large quantities of the unusual mineral willemite (the pure anhydrous silicate of zinc), smithsonite (zinc carbonate), hydrozincite (basic zinc carbonate), and calamine (hydrous zinc silicate). Shipments of the zinc ore were made to smelters in the Mississippi valley in 1905, but in 1906 and 1907 little ac-

DETAILS OF WITT CRUDE-OIL BURNER AND AN INSTALLATION IN A NOISELESS FURNACE

along the contact of the limestone with the chlorite schist and magnetite. Over a dozen bodies have so far been discovered and some of them worked out. It is stated that over \$10,000 worth of ore has been mined.

The ore deposits which occur wholly in the limestone have their chief development in the vicinity of the town of Van Anda. The three principal mines are the Copper Queen, Cornell and Marble Bay, of which the latter has been most extensively developed. It is owned by the Tacoma Steel Company, which holds about 1500 acres in the western part of the island. The mine is 771 ft. deep and the orebody from 260 ft. to the present workings has varied in length from 70 to 105 ft., and in width from 5 to 45 ft. The ore is bornite with subordinate chalcopyrite and a little pyrite, pyrhotite and molybdenite and is throughout essentially high grade, carrying good values in gold and

and on Anvil island. On West Thornmanby island a fine, pure clay occurs, which, on drying, produces a fine powder, which makes a good natural powder for metal polishing.

Noiseless Furnace for Burning Crude Oil

The accompanying illustration shows an arrangement of a boiler furnace fitted with a Witt crude-oil burner which protects the flues of the boiler from the direct flame, preheats the air supply and produces a noiseless fire. The air is admitted through flues below the fire-box leading to the bridge and returning directly under the oil burner. The burner is placed directly under the tubes, but since the heated air enters at the bottom of the combustion chamber, the flame is not local but the fire is distributed throughout the furnace.

tivity was apparent. A geologic examination of the north end of the Tres Hermanas district was made during the field season of 1908 by Waldemar Lindgren, of the U. S. Geological Survey.

The *Marine Review*, of Cleveland, Ohio, reproduces some figures as to Lake rates on iron from a report made 25 years ago. The contracts made in the winter of 1882 were at the rate of \$1.40 per ton from Escanaba to Cleveland and \$1.75 to \$2 from Marquette. The total amount landed at Cleveland that year was 2,900,431 tons. In the winter of 1883 contracts were made for bringing ore from Escanaba to Cleveland at \$1 to \$1.10 per ton, and from Marquette at \$1.15 to \$1.25; the closing prices were at \$1.40 to \$1.50 from Escanaba and \$1.75 to \$2 per ton from Marquette. The total amount brought down in 1883 was 2,300,351 tons.

Mines of the Lordsburg District, New Mexico

By J. L. WELLS*

The renewed activity in the Lordsburg mining district may make of interest a review of the mines of this southwesterly portion of New Mexico. The Lordsburg district comprises two mineral sections, locally known as the Virginia and the Pyramid districts. The principal mines are situated from $2\frac{1}{2}$ to 9 miles southwest from the town of Lordsburg, which is on the Southern Pacific and the Arizona & New Mexico railroads. An able article by Prof. Fayette E. Jones, with an accompanying map of the district, was published in the JOURNAL, Sept. 7, 1907, outlining the history of the camp and describing the ore deposits. Since the notes were taken for the article referred to considerable development work has been done in the district.

The principal properties being developed are the Eighty-five, Miser's Chest, Bonney, Last Chance, Nelly Bly and Robert E. Lee. All of these mines give encouragement from this development, the most favorable results being shown on the Eighty-five and the Nelly Bly, where the most work was done. On the Eighty-five property during 1908 there were completed 200 ft. of shaft from the main tunnel level on the Emerald vein, and two levels were developed disclosing a vein from 4 to 12 ft. in width. A second level, which is 200 ft. below the tunnel level, is approximately 400 ft. below the surface of the vein at its outcrop on the mountain.

From these workings on the Emerald vein there were shipped during 1908, about 1000 tons of ore. The ore from this vein is highly silicious, carrying from 60 to 90 per cent. silica, 0.1 oz. gold, 3 oz. silver, and $3\frac{1}{2}$ per cent. copper. In the lower levels the vein matter is softer and native copper is found as well as several varieties of copper ore. The ore of the Superior mine to the southwest is of higher grade, but is supposed to be an extension of the Emerald vein. The ore of the Atwood and of the Eighty-five mine is also highly silicious and of approximately the same grade as the Superior ore.

There were about 7500 tons of ore shipped from this vicinity during 1908, this tonnage coming mainly from the Superior, Eighty-five, Atwood and Bonney mines. These ores were shipped to the Copper Queen reduction works, at Douglas, Ariz., and were used principally for converter lining. Among the other mines of this district, which have not been operated during the last year, are the Aberdeen, Nelly Bly, Last Chance & Clara Sutton, Venus group and Robert E. Lee. The Nelly Bly and the Robert E. Lee are adjoining mines and each has produced

high-grade copper-silver ore. The Nelly Bly resumed operation the first of this year. The Last Chance & Clara Sutton has also resumed and is sinking the main shaft which is at present about 300 ft. deep. The surface ore of this mine contained principally silver, but copper is now becoming a factor. The mine has produced over \$100,000 worth of ore.

The Venus group has been considerably prospected over the surface to a depth of from 10 to 180 ft. The main shaft on the Venus claim is 308 ft. deep, and there are several hundred feet of drifts and cross-cuts. There are two veins included in this development which, as far as have been disclosed, are from 50 to 100 ft. apart on the Venus property, but diverge as they pass to the southwest into the Last Chance property. The east vein which is the stronger of the two is almost vertical. It averages over 6 ft., as developed, and at the 225-ft. level it is 10 ft. wide.

The west vein dips to the east at an angle which would indicate that the veins will be joined together at a depth of 500 ft. It averages 4 ft. in width and the principal development has been done on this vein. From it there have been over 5000 tons of ore milled by the pan amalgamation process, the high-grade ore being shipped to the smelters. The principal metal in these veins is silver, with small amounts of gold, copper and lead associated. The mine has produced over \$200,000 from these workings.

There are two other well defined veins on the property, which have been developed in different places to depths from 40 to 180 ft.; one of these carries more copper and gold than the Venus and the other a higher average silver content. The veins of this group are influenced by a shattered zone and are intersected by numerous small veins and seams which in many cases carry high-grade ore; from one of these intersecting veins in the Venus workings, several tons of ore were taken that sold for \$1489 per ton. There remains developed in the Venus workings over 14,000 tons of ore, having it is said an average content of 18 oz. silver per ton.

To the west, between this group and the Nelly Bly and Robert E. Lee, a location was made last year by D. W. Briel and T. A. Lister, on which some exceptionally rich ore was discovered at the surface. The ore carried 6 per cent. copper but ran very high in silver. This vein has not been prospected enough to determine its length in either direction. To the south about nine miles from the Venus group, is an undeveloped district in the vicinity of South Pyramid mountain. Rich silver ore has been discovered in some of the prospects there.

The Aberdeen mine, owned and operated by the Penn Mining Company, has resumed operation and will sink the shaft to the 600-ft. level, with capital now in

the treasury, and by those in position to know it is stated that they will probably continue to a depth of 1000 ft. If this plan is carried to completion, the owners will doubtless prove their holdings to be more valuable and also demonstrate, what is much needed in this district, that the mineral deposits are not all on the surface. There has been no deep mining in this district, 400 ft. being the deepest workings, and this depth only in the Eighty-Five, Superior and Nelly Bly. Considerable money has been spent in the district but much of it wasted, through ignorance, in shallow surface work, building mills and buying traction engine outfits.

Evolution of the Gravity Stamp Mill

By ALGERNON DEL MAR*

It is a remarkable circumstance that the ancients who were in many respects first-rate engineers should have overlooked the possibilities of a mechanical device for crushing gold ores. It cannot be that they were lacking in the necessary engineering skill but rather that they could not see the advantage of combining a water wheel with the pestles already familiar to their workmen and thus save the labor and feed of many men. The sole reason must have been that while slaves were cheap machinery was not necessary but when slave labor was no longer available or had become expensive, the crude gravity stamp mills were evolved from methods and appliances long known to the ancients.

The system of gold milling practiced in Egypt in ancient times will be described to show that the next step was easily attainable and required no great amount of adaptability. The quotation is cited from Diodorus Siculus: "When the stone containing the gold is hard, the Egyptians soften it by the application of fire and when it has been reduced to such a soft state that it yields to moderate labor, several thousand of these unfortunate people treat it with iron picks. Those who are above thirty years of age are employed to pound pieces of the stone of certain dimensions with iron pestles in stone mortars until reduced to the size of a bean. The whole is then transferred to women and old men who put it into mills arranged in a row, two or three persons being employed at the same mill, and it is pounded until reduced to a fine powder. (Here we have a stamp mill operated by three persons lifting a heavy pestle presumably of iron and probably with a wooden stem.) At length the masters take the stone thus ground to powder and carry it away to undergo the

*Lordsburg, New Mexico.

*Mining engineer, South Pasadena, Cal.

"final process." The final process was "to wash on inclined tables furnished with two cisterns, all built of stone." Here we have what corresponds to a modern canvas plant. Evidently the amount of ore crushed was too great for slaves to pan, so it was run over tables with a stream of water.

Although we have no description of a gravity stamp mill being used by the Romans it would have been only a short step in evolution to have used mechanical power to lift the heavy pestles used by the Egyptians. From the Hungarian mines there are remains that date from the fifteenth or sixteenth century. The tilt-hammer used in China has been described by Henry Louis.

From the sixteenth century to the time of the discovery of gold in California little improvement was made in the gravity stamp. It was a crude affair consisting of three or four stamps. Each stem consisted of a square wooden beam usually of oak, 12 ft. long and 6 in. square, the shoe of cast iron being inserted in the wooden stem and bound with iron bands and tightly wedged. The mortar was either open, or a wooden box the bottom of which was composed of hard quartz fragments tightly beaten in with heavy iron rams.

Sometimes the screens were of punched iron but more often the discharge was simply over a side of the box which could be moved up and down to alter the fineness of the crushed pulp. The stamps weighed from 150 to 250 lb. and were dropped from 8 to 12 in. about 70 times per minute. The cams and tappets were of wood and the stamps were lifted, without turning, in pairs when the battery was composed of four stamps, and alternately when of three stamps. Even the idea of five stamps and lifting in the sequence that gives the best flow of pulp is of late origin. The oldest mills in California had four stamps in a battery all on one cam shaft. Plumas county has many such mills. It is said that six stamps were sometimes put in a battery and can be seen in Mexico today.

The modern stamp mills of the best type as used in different parts of the world are simply the refinement and perfection of these early types, made possible by the improvements in the materials of which the different parts are made. Our stamp now weighs from 1000 to 1700 or even 1800 lb. and drops from 6 to 8 in. at the rate of 100 to 110 drops per minute.

It was the discovery of gold in California and Australia and the high cost of labor, that made necessary improved machinery for crushing ore and from this necessity the old gravity mill was improved upon until we have the stamp mill in its present state of perfection. The original stamp mills as well as the mortars of the ancients were used simply to break ore that had already been subjected to a

preliminary process of comminution. It is a curious fact that the stamp mill is gradually reverting to its original use as a crusher for rock of medium size.

When the cyanide process was unknown or in its infancy stamp mills were in general use as amalgamators for it was found that a thorough admixture of mercury with gold in the mortar often saved more gold than when the processes of crushing and amalgamating were conducted separately. With the introduction of the cyanide process and the finer grinding of the ores, amalgamation has to a great extent been given up, so that the gravity stamp mill is gradually occupying the place of an intermediate crusher between the rock breaker and the fine grinder. As a coarse or fine crusher it is excelled by other machines, but as occupying the place described above in the process of winning gold from its ores it has no peer.

As the use of the cyanide process for the extraction of gold increases the purpose of the stamp mill is becoming simply a crushing machine. Its simplification from a battery of five stamps to that of one stamp is taking place at the same time, for it has been found that the single stamp crushes more ore per unit or per horsepower than when more stamps are arranged in the same battery. The amount of labor, however, increases with the single batteries so that especially where labor is high a 5-stamp battery with a narrow mortar will in the end be more satisfactory than five single stamps. When amalgamation is necessary inside the battery a roomy 5-stamp battery is used and not the single unit.

Metallurgical Treatment of Jamesonite Ores*

By G. P. IVES AND I. D. OSSA

In the ore from the Black Hills, the jamesonite is associated with quartz, servanitite, and sometimes small amounts of galena. This ore occurs in comparatively narrow veins and cuts across the formation of Algonkian schists and slates, and can often be traced for considerable distances. Jamesonite is of value as a commercial source for the metals lead and antimony. Also the gold and silver usually contained may be recovered.

Under the supervision and advice of Prof. C. H. Fulton and Prof. M. F. Coolbaugh, an effort was made to find standard economical methods for the treatment of this rather complex ore.

The ore was crushed to the proper size and roasted to 2 to 3 per cent. sulphur. The roasted ore, properly fluxed, was smelted in a cupola-lead furnace to a lead-antimony alloy or bullion containing also the precious metals. It was found

advisable during the operation to form a copper-lead matte, which was done on a small scale, due to the scarcity of copper ore. The lead-antimony alloy was electrolytically refined by the Betts' process, and gave a clean and economical separation of lead, antimony, gold and silver.

The ore furnished was of two lots which showed the following composition: No. 1: SiO_2 , 66.5 per cent.; FeO , 6.02; CaO , 0.7; Al_2O_3 , 5.33; S , 4.1; Sb , 4.2; Pb , 7.95; Zn , 1.5; As , 0.3. No. 2: SiO_2 , 35 per cent.; FeO , 3.85; Al_2O_3 , 1.3; S , 9; Sb , 17.5; Pb , 32. The first lot of ore was of low grade and could easily be concentrated, while the second lot was smelted directly, mixed with the fines of the mechanical concentration, previously roasted or sintered.

ROASTING JAMESONITE ORES

The proper temperature for the oxidation of the antimony sulphide seems to be about 350 deg. C. When this temperature is reached, the atmospheric oxygen converts the sulphide into sulphur dioxide and antimony trioxide. In the presence of an excess of air the antimony trioxide is oxidized to pentoxide, and this, combining with some of the trioxide, forms the tetroxide. The presence of an excess of air is an essential point in the roasting of antimony sulphide, for it is necessary to conduct the roasting operation in such a way as to oxidize all the antimony to the tetroxide. The trioxide is volatile at temperatures higher than 350 deg. C. Some part of the trioxide, in the presence of oxide of lead and air forms a lead antimoniate; it seems that there is no formation of sulphate of antimony.

After the oxidation reactions have taken place the temperature is raised, resulting in the formation of lead silicate. This reaction takes place between 700 and 900 deg. C., and the combination is effected without the mixture becoming fluid. At this time, if the temperature is kept constant, the lead silicate starts to fuse, sintering and agglomerating the furnace charge which is taken off.

The 2990 lb. of first-class ore was roasted in a Brickner furnace, using wood as fuel. The furnace took charges weighing 250 lb. each, and the roasting to the sintered state lasted about two hours per charge. The roasted ore, amounting to 2927 lb., was of the following composition: SiO_2 , 35 per cent.; FeO , 4; Al_2O_3 , 1.36; Pb , 32.5; S , 4.15; Sb , 15.4.

The operation of roasting is necessarily divided into two parts, viz: (1) Roasting at a low temperature with free access of air. (2) Sintering of roasted product at a relatively high temperature.

SMELTING

The roasted ore was smelted in a small cupola furnace. The first problem to solve was the calculation of the furnace charge, taking into consideration that it was advis-

*Abstract of a thesis submitted to the faculty of the South Dakota State School of Mines, May 15, 1908.

able to smelt all or very nearly all of the low-grade ore and that the formation of matte was not only advisable but strictly necessary for the proper running of the furnace. It soon became evident that the low percentage of lead in the charge was causing a considerable loss. Therefore, the charge was changed to a typical lead charge.

To start the furnace a cordwood fire was made in the crucible and kept burning for 24 hours. When the well was hot, all ashes were removed and the lead well cleaned. Lead was then put in and the breast closed up with firebrick. Cordwood was charged from the top and ignited through the tuyeres. The tuyeres were set in place and a slight blast turned on. The furnace was charged to three-fourths of its height with coke; on top of that the blowing-in charge, consisting of 100 lb. of slag and 30 lb. of coke. After the second blowing-in charge was added the first regular charge was added. A blowing-in charge was added every fourth charge for the first four or five hours.

The bullion produced showed the following analysis: Lead, 78.8 per cent.; antimony, 16; copper, 3.5; gold, 3 oz. per ton; silver, 37 oz. per ton. The matte made was of the following composition: Lead, 2.14 to 3 per cent.; copper, 7.30 to 11.97; antimony, 0.56 to 1; silver, 13.68 oz. per ton; gold, 0.24 oz. per ton. The slag made during the smelting operation closely resembles the following: SiO_2 , 30 per cent.; FeO , 33; CaO , 18; Al_2O_3 , 6. The slag was of the general formula:

It was calculated to correspond to the formula:

It is mainly a mono-silicate, the silicate degree being 1.68.

We believe the formation of a slag rather high in silica and lime is most suited for the operation and we suggest a slag of the following composition: SiO_2 , 36 per cent.; CaO , 25; FeO , 26; Al_2O_3 , 7. This will answer the requirements admirably, either from a purely metallurgical or economical standpoint.

The smelting of jamesonite ore can easily be done in a blast furnace without previous roasting and we firmly believe that losses of antimony will be in this case greatly avoided. While it will be necessary to roast the fine concentrates, the coarse concentrates and first-class ore can be smelted directly, after mixing them in such a way as to form 8 per cent. matte fall. It is desirable to have some copper in the matte and it will, therefore, be necessary to add some oxidizing copper ores or rich copper sulphides. The matte formed can be resmelted to a 30 or 40 per cent. copper matte and shipped to a copper refinery, while most of the lead of the first matte formed may be recovered in the resmelting operation.

The volatilization of antimony in the

blast furnaces cannot be lower than 10 per cent. of the antimony in the ore. This may be recovered by passing the fumes to a bag-house. If the ore is roasted, the recovery of the antimony is a little more difficult, due to the fact that the roasting fumes cannot be filtered by the bag-house system.

ELECTROLYTIC REFINING OF LEAD-ANTIMONY ALLOY

The Betts process for the electrolytic refining of lead or base bullion is based on the fact that, if in a dilute solution of lead fluosilicate, the impure metal is used as an anode, while a sheet of pure lead is used as a cathode, the electrolyte dissolves the lead of the impure anode and deposits the lead free of impurities on the cathode. The Betts process has been successfully used in three or four electrolytic refineries of this country and has proved more advantageous than the old Parke's process for the desilverization of lead bullion.

The recovery of the precious metals can be accomplished by smelting the final slimes which contain mainly Au, Ag, accompanied by Cu, Sb, Pb, etc., properly fluxed in graphite crucibles, so as to form a "doré bullion" containing certain base metals as impurities. The doré bullion cast in the form of anodes can be electrolytically refined by the Dietzel process or by the Moebius or Balback process. In these processes the electrolyte is a copper-silver nitrate solution, and while they differ in details of arrangement, their efficiency is uniform and extraordinarily high.

U. S. Geological Survey Office at Denver

At Denver, Colo., the U. S. Geological Survey has opened a permanent branch office to facilitate the transaction of its Western work. This office is not only to provide a base of supplies for the large corps of engineers which the Survey keeps in this field, but is also designed to meet the need of the Western public for a source of information less remote than Washington. The office is located in the Commonwealth building, and for the present is under the direction of R. C. Miles, special disbursing agent.

A supply of copies of the publications available for free distribution will be kept on hand, as well as a complete file of the topographic maps, geologic folios, and other publications of the Survey subject to sale. All of these publications will be open to inspection by persons desiring information concerning the subjects treated. Prospective purchasers of maps and folios will be referred to the nearest sales agent, and the free publications will be distributed in Denver to those making application.

The discontinuance of the Denver office over a decade ago was the occasion of much criticism of the policy of the Survey and the reestablishment of the office will be appreciated by Western mining interests.

Le Roi, No. 2

The report of this British Columbia company shows that the year ended Sept. 30, 1908, was the most prosperous year that Le Roi No. 2 Company has yet had. There was a profit on working account of £53,053, after writing off £19,795 for depreciation of machinery and plant and mine development. Dividends to the amount of 6s. per share, absorbing £37,800, have been paid.

The ore shipped to the Trail Smelting Works amounted to 29,648 tons, of an average value in gold, silver and copper of \$23.60 per ton. The receipts from the smelter were \$535,245, or \$18.053 per ton. The average value of the ore was, in gold, 0.9597 oz.; silver, 0.691 oz.; copper, 30.705 lb. per ton. The company also obtained a small revenue from its own concentrating plant, which treated 15,044 tons during the period. The cost of stoping, ore sorting, power plant and diamond drilling is stated to have been \$3.60 per dry ton of ore mined. Depreciation of machinery and buildings and mine development cost together \$1.71 per dry ton, making the total costs \$5.31 per ton.

The mine is now being operated down to the 900-ft. level and the main shaft is to be sunk farther. The most important discovery of the year has been the strike of ore by a diamond drill some 320 ft. below the 900-ft. level, which is believed to be the downward continuation of the south vein of the Le Roi, which is now yielding high-grade ore. The consulting engineers say that as this vein is dipping northward into Le Roi No. 2 ground, the importance of this discovery hardly needs emphasizing, its true significance lying in the fact that below about the 1200-ft. horizon of the Josie the above vein will continue to be the property of the Le Roi No. 2 definitely.

During the current year efforts will chiefly be directed to the development of the property in depth in order to open up and render available the ore now proved by the drill to enter the company's ground at a depth of 1200 ft. and beyond.

Practically the entire quicksilver production of California is sold by the Eureka Company, of San Francisco. The producers consign their product to this selling agent, which divides its sales *pro rata* among the consignors. The Eureka Company charges 1 per cent. commission and advances 80 per cent. on consignments, charging 6 per cent. interest for such advances.

Examination of Gold Dredging Properties

Loose Methods of Sampling Frequently Responsible, but Dredge Builders Often Blamed, When Ground Fails to Yield Expected Returns

B Y T S R U H

Many dredging properties that are offered to investors are owned or held under option by men who know little or nothing about gold dredging. In most cases this property has been old placer ground abandoned years ago, and often the owner or the man whom he has hired to sample the property is a placer miner. In sampling the property, the placer miner will find the pay-streak, take a few pans of dirt and make his calculations from this. For argument, we will say five pans of dirt yield three cents. Then he calculates that it requires 160 pans of

per cent. or 36 pans, and the value per cubic yard will be $\frac{160 \times 5c.}{36}$, or 32c., which would be exceedingly rich ground for gold-dredging purposes in California and good ground in many parts of Alaska. However, this test is in no wise reliable, since probably the sampler has not sunk test shafts or pits, but has sampled open cuts made by the placer miners, who followed the best pay-streaks almost by instinct. Therefore he has not taken an average sample; he simply prospected one of the best places in the property.

he can see no good returns. When he has not sufficient money of his own to install the dredge, he gets in touch with someone who has read something about gold dredging, and who thinks that it is an ideal field for investment—which it is when properly exploited.

THE ORDINARY INVESTOR

Like the man who obtained the ground, these investors know little about gold dredging, and although they may be first-class business men in another particular line, at the same time they "fall down"

GOLD DREDGING GROUND NEAR NOME, ALASKA

dirt to make a cubic yard. Therefore he argues

$$\frac{160 \times 3c.}{5} = 96c.$$

This he knows is exceedingly high, so, to be "conservative," he cuts his estimate in half. The property may be good for dredging, and the gravel may be rich, but it is needless to say that such a test is absolutely worthless.

If the placer miner will sample this ground from top to bottom, he will very likely have 30 pans of dirt and get perhaps 5c. in gold. Further, to make this test a fair one, he should take into consideration that at least 20 per cent. of the gravel has been thrown out as large stones. Therefore, the correct quantity of material would be 30 pans plus 20

If the sampler had sunk a few shafts systematically to bedrock, and then sampled from top to bottom, he would have come pretty near knowing what was in the ground. If the ground is so situated that it is impossible to sink shafts on account of water, then the only other method is to have an experienced driller drill and test the ground. It is impossible to emphasize too strongly the word "experienced" in the above sentence. Of course by "experienced," I mean one *experienced in drilling ground for gold dredging purposes*. An oil driller is worse than none at all.

Of course this costs money; and the average person who attempts to start a gold-dredging proposition does not care to put money into the ground for which

when it comes to a question of prospecting the property systematically and finding out what is really in the gravel before they go ahead.

The investor perhaps goes half way across the continent to look at a piece of gold-dredging property, and then will see the miner take pans of dirt from the gravel (as previously described), wash the "sample" and see with his own eyes the gold that is obtained. I have not only seen this, but I have also seen the miner in order to demonstrate the richness of the property sweep up a pan of dust and dirt from a road that crossed the property, take this to the creek, pan it and get excellent results. Of course the miner knows that the wind and the rain had blown or washed away the light

material, but it is ten chances to one that the investor does not know this.

I remember one property at which the men who financed it only took a few pan tests and then proceeded to purchase a gold dredge. They claimed that they had prospected the ground in a very thorough and systematic manner, and had about 40 samples of gold in glass tubes to show for their work.

The dredge that they bought was a good machine and one suitable for the ground. However, these investors placed the dredge where they guessed they had the best values, and proceeded to make a pit in which the dredge was erected on the same principle as their prospecting, namely—on a cheap basis. Therefore, they provided a very small pit, thinking that a dredge which could handle 2500 yd. per day would have a pit in a couple of days which would be large enough to suit every possible need. But imagine

is in the ground, that he knows that the dredge has handled a considerable quantity of dirt, and that he also knows that he has not got the money in the bank. Therefore, the only deduction left to him is that the dredge does not save the gold.

Further, at the end of 60 days, the final payment owing to the dredge builders and amounting to 10 or 15 per cent. of the purchase price, or on a dredge costing \$80,000 not less than \$8000 is due. If the dredge has made working expenses, it has done very well, but no doubt the investor has calculated on taking this final payment out of the ground and therefore has not raised any capital to meet this payment.

Since he has not been able to dig this money out of the ground, he naturally argues that the dredge builders are at fault and he is not going to pay this final payment. Although the dredge may be built in strict accordance with

Copper Industries of Italy

With the exception of the mines at Montecatini, which yield an ore carrying 20 per cent. copper, the average tenor of the ores produced by the Italian copper mines ranges from 5 to 12 per cent., according to Alfred Greco in *l'Echo des Mines*. In a recent issue he outlines the present state of the copper-mining and consuming industries of Italy.

The most important mines are at Libiola, in Liguria, and at Montecatini, Boccheggiano, Fenice Masselana, Capanne Vecchie, etc., in Tuscany. Cupriferous pyrite is abundant in the neighborhood of the Alps, at Algana, near Novare, at Agordo, near Bellune, and in other parts of Turin. Some of the ore from this district was once used by an electrometallurgical company with a plant at Agordo, but later was employed only for making sulphuric acid. On the northern slope of the Apennines, near Parme and Plaisance, there is an abundance of chalcopyrite, though low in copper.

Until recent years the output of copper in Italy was small, owing to the expensive methods of extraction. The leaching process was introduced in 1880, and first put the industry on an economical basis. The process as applied now consists in crushing, roasting, leaching and electrolytic recovery of the copper. After leaching out the copper sulphate the solution runs into large reservoirs and then to electrolytic vats in which the copper is precipitated on cast-iron cathodes, yielding a cement copper containing 80 per cent. Cu. This is then refined in reverberatory furnaces.

The Manhès converting process was first introduced in 1888 by the Compagnie Italienne Metallurgique de Torretta and electrolytic refining was adopted in 1900 by the same company. A certain amount of foreign raw material is imported, mainly from Coro-Coro, Bolivia, from the Lake Superior district and from Germany. Copper and brass are imported from England, Germany and France. Italy has, however, begun to export copper and brass to Switzerland and Argentina.

The copper industries are now developing on a larger scale, principally under the stimulus of increased naval construction. The most important manufactures are copper and brass seamless tubes, sheets and plates for locomotive fireboxes, bars and wire. There are now five plants for the electrolytic extraction of copper from pyritic ores, two copper refineries, two copper foundries, and six works for shaping and rolling articles in copper and brass.

An American company is reported to be employing 700 men in a mica mine near Kodarina, India, about 250 miles from Calcutta on the East India railway.

DREDGING GROUND—WHERE THE OLD MINER STOPPED

their surprise when the first day of operation passed, and they had not enough tailings to fill a small chicken house. However, there were other surprises in store since it took at least a month to open up the pit so that the dredge was able to work to its full capacity; and it was almost another month before the dredge had dug down to bedrock on which lay 90 per cent. of the gold.

Therefore, considering the lost time that a new dredge naturally consumes in making adjustments, and the fact that the dredge handled the top material which contained little or no gold, there were two months of operation, and the dredge had not paid working expenses.

In such cases as this the ordinary investor begins to feel very uncomfortable, and thinks that he has a gold brick on his hands. He goes to the dredge builder and states that he knows that the gold

the contract and specifications, at the same time he will be able to drum up some trouble real or imaginary, on which to stand off this payment, and he is not open to any sort of argument.

He still thinks that his ground is worth 50c. per cu.yd., where it is not worth 15c.; and even at 15c. per cu.yd., it is an exceedingly fine investment, but since he has not seen even the 15c., or perhaps 6c., for all the output has been consumed by the first two months' pay-roll, he naturally feels loth to put more money into what on the face looks like a failure. However, if the dredge builders are patient, and do not tie up his enterprise he may work on the next month, and handle say 60,000 cu.yd. with a gross return of \$9000, and with a total operating cost of say \$2500 to \$3000. After this experience the investor becomes a much wiser man.

Air Economy in Rock Drills

By ALEXANDER WEST

At a meeting of the Transvaal Institute of Mechanical Engineers some time ago, J. A. MacGeorge contributed an article on "Notes on Small Stope Drills" in which he gave the result of some trials made by him, at the Angelo Deep mine, to ascertain the boring speed and the air consumption of a 3-in. Konomax drill¹ and of a 3¼-in. tappet drill of ordinary design (probably the Little Giant drill). Mr. MacGeorge states in his paper that the tests were made, the air consumption was measured, and the trials conducted the same as in the City & Suburban mine tests in 1904. The results are given in a table accompanying his paper showing great care and much labor in its compilation, but unfortunately every mistake made in the City & Suburban trials is repeated so that the test has little practical value. It seems a pity that, since these mistakes were pointed out at that time by

low the horizontal. Although 80 runs were made, the results of only 27 runs were given without any explanation of why the others were thrown out.

As will be seen from the accompanying table the two drills were tested at air pressures of 80 lb., 70 lb. and 60 lb. per sq.in. The average depth of hole drilled was only 8 in. for the Konomax and 5 in. for the other drill. The results obtained condemn themselves, for they indi-

for the increased speed in boring more than counterbalances the increased air consumption. This is shown by a test run by the engineer of the Robinson mine, Mr. McCracken, with holes of an average depth of about 18 in. The holes were drilled at an angle of about 20 deg. from the horizontal and before starting the test to a depth of 7 in. The air pressure was 50 lb. per sq.in., which is about an average of that in use here at many mines. The

MAXIMUM AND MINIMUM EFFICIENCY OF THE KONOMAX AND THE 3¼-INCH PISTON DRILL.

Drill Tested.	Test Number.	Gage Pressure.	Total Time of Run.	Depth Drilled.	Size of Drill.	Total Cubic Inches Removed.	Cubic Feet Free Air Consumed.	Rate of Drilling Per Minute.

KONOMAX DRILL.

several engineers, they should have been made again in these tests. The drills were set up so as to drill a vertical hole in a granite block. The air was furnished from a receiver so that by reading the pressure at the start and the end of the test the amount of air used was calculated. The holes were not started before the test runs began, the steel was not accurately centered, nor were the bits of uniform size; consequently the results have little comparative value. Besides, as the holes were drilled vertical the results would have little practical use at least on the Rand for all the holes except those in shafts are drilled only slightly inclined above or be-

cause that a machine drills more quickly at 70 and 60 lb. than at 80 lb. per sq.in. The results would also indicate that a hole can be drilled much faster with a 2½-in. bit than with a 2¾-in. bit. The air consumption indicated is also erratic. The only practical result from the test seems to be that it showed that the Konomax drill at greater than 40 lb. per sq.in. can drill almost as fast in free-boring holes as can the best machines of the ordinary type and uses only 60 per cent. as much air.

COMPARATIVE VALUE OF THE DRILLS IN STOPING

But at lower pressures and in difficult holes the ordinary drill can do better and more efficient work than the Konomax,

results showed that an Ingersoll-Sergeant auxiliary-valve machine bored 129.9 in. in 76 min. 21 sec., or 1.708 in. per minute, and the Konomax drilled only 127 in. in 116 min. 18 sec., or only 1.1 in. per minute, the Ingersoll machine thus doing 55 per cent. more work per minute. Tests under working conditions at a certain mine confirm this result. It is known that on this field the Slugger drill can, with high air pressure, drill rock with a smaller consumption of air than any other ordinary drill. This drill has not been compared with the Konomax drill. Owing to low air pressure available the Slugger drill is little used here, however. Fraser & Chalmers are introducing another drill called the Minamax, which is a modified Darlington drill with air used expansively.

¹The operation of the Konomax drill is described in the JOURNAL, May 23, 1908, p. 1045.

Coal Mining at Hosmer, British Columbia

SPECIAL CORRESPONDENCE

The Hosmer Mines, Ltd., a company closely identified with the Canadian Pacific Railway Company, last December commenced shipments of coal from its mine at Hosmer, in the Crow's Nest Pass district, in southeast Kootenay. The opening of the mine, the erection of buildings, coke ovens and other surface structures, installation of plant and machinery, laying of railway trackage, etc., had been in progress for more than a year previously.

The company owns six sections of coal lands, and two sections of surface on which are located the town of Hosmer and the mine surface works and plant. The known coal seams number 13, varying in dip from 65 to 35 deg., and in thickness from 4 to 30 ft. A main three-compartment tunnel, driven at right angles to the measures, is in about 4500 ft., and has cut nine of the seams. It is expected that the remaining four seams will be intersected within 500 ft. from the present face. The entry is about 600 ft. above the track at Hosmer railway station. Two compartments of the main tunnel are for haulage purposes, and the third for traveling and use as a pipeway. A single compartment parallel tunnel for ventilation is used as a return air course.

Driving of the tunnels was commenced in what are known locally as the Fernie shales, underlying the coal measures, which were reached at 847 ft. The first seam cut is, therefore, the lowest of the series. The coal is bituminous, high in hydrocarbon and consequently an excellent coking as well as steam coal. Much of the product of the mine will be used as fuel for the Canadian Pacific locomotives on its Crow's Nest and other railway lines in the Kootenay and Boundary districts of British Columbia.

The mine is ventilated by a 20x9-ft. Walker fan, driven by a pair of 30x16-in. engines connected to the fan by a rope drive. Steam is supplied by three 80-h.p. boilers. The fan house is of steel and concrete construction and the engine house of brick. Other buildings at the mouth of the mine are concrete lamp house and timekeepers' office, locomotive house for the compressed-air locomotives, and wash houses with baths and lockers for the miners.

The coal is lowered to the level of the tippie by a steam-actuated double-track incline, each track being an independent incline. The mine cars, each of two tons capacity, are lowered in trips of 20 cars; empty cars are hoisted in convenient numbers. Power for haulage is from a pair of 28x48-in. first motion steam engines, with 8-ft. drums fitted with clutches and brakes. Steam for handling these, with

reversing gear and throttle, works through catarcet cylinders.

Compressed-air locomotives haul the cars from the foot of the incline and dump them into the tippie by means of a cross-over dump. The tippie is equipped with shaking screens to separate the slack for the coke ovens, and picking bands for removal of refuse from the lump coal. Storage bins hold 2600 tons of screened coal, 3000 tons of slack, and 200 tons of refuse. Coal is loaded into closed cars by a box-car loader and into open cars by chutes. The slack is hauled in 7-ton larries to the coke ovens by air locomotives, which also haul the refuse in iron self-dumping cars to the dump.

The coking plant consists of 240 beehive ovens, 12 ft. in diameter and 7 ft. in height; total capacity about 300 tons of coke per day. Only one-third of the ovens are in use, but others are being started as circumstances permit.

The power-house building is of reinforced concrete with steel floor joists and roof trusses and corrugated-iron roof. Two low-pressure compressors supply air at 100 lb. pressure for rock drills, inside hoisting engines, and other purposes; two high-pressure compressors supply air at 1000 lb. pressure to five compressed-air locomotives. Two 75-h.p. alternating-current generators for electric light for plant and town, are driven by two 125-h.p. steam engines. All the steam engines are fitted with cut-off valves to allow steam to be carried at 120 lb. pressure, cut off early and used expansively. Exhaust steam passes through a 1500-h.p. Hoppes heater, heating the boiler feed water to 200 deg. F. A 10-ton traveling crane facilitates handling of machinery.

The boiler house is of similar wall and roof construction as the power house, but has a cement concrete floor. In it are four 250-h.p. Babcock & Wilcox boilers, with chain-grate stokers, and appliances for the convenient handling of coal and ashes.

The mine buildings in the part of the town reserved for the company's use include a general office, mess-house, three residences for officers, several houses for foremen, large boarding house, 60 houses for miners, and hospital. All buildings are neatly finished and painted, and supplied with water and electric light.

Hosmer lies nearly midway between the Crow's Nest Pass Coal Company's collieries at Coal Creek and Michel, respectively, the mines of which have been in operation for various periods up to 12 years. All development, construction and installation work at the Hosmer mine has been done under the direction of Lewis Stockett, general manager.

The 54-mile double-rope tramway connecting the mines of the Turkestan Coal Mining and Metallurgical Company with Rostowzewo, the nearest station of the Central Asiatic is shortly to be completed.

Report on Cause of Explosion at the Short Creek Mine

The State mine inspectors who made an examination after the explosion at the Short Creek mine of the Birmingham Coal and Iron Company, in Alabama, found that the main entry was ahead of the air, and it is believed that the explosion occurred in what is known as the new slope. The inspectors state that the manner in which the shots were placed, and the quantity of dynamite used in charging the holes leads to the belief that when the shots were fired a large quantity of carbon-monoxide gas was generated and afterward ignited by the flame from one of the shots. It was further stated that the shock of the firing caused fine dust to become suspended in the air, and by being ignited, this element added additional force to the initial explosion. This belief in the activity of dust in this explosion is strengthened by the fact that the explosion was confined to the dry and dusty part of the mine.

Of the sixteen men who were in the mine at the time of the explosion, some were badly burned, and death must have been instantaneous. Other victims were not burned at all, but died from suffocation by inhaling the afterdamp produced by the explosion.

A previous explosion occurred in this mine on October 26, 1908, and six men died of the burns received in this accident. The mine inspector at the time of this first explosion, notified the officials of the coal company that the method of drilling, charging and firing shots in the mine was dangerous, and that all men should be withdrawn from the mine while the shot-firers were exploding the charges. In compliance with the instructions given at the time of the first accident, the mine management has since been busy installing a system of watering the mine, and at the time of the last disaster, the pipe lines were already extended to some parts of the mine, and it is believed that this precaution of sprinkling, prevented the explosion extending over the entire mine, and causing a much larger loss of life. It is stated in conclusion that if former suggestions in regard to the discontinuance of shooting at noon had been complied with, and all shots had been fired at night by certified shot-firers, the probability is that the explosion would not have occurred, and if it had taken place, only one life would have been lost instead of eighteen.

On Dec. 31, 1908, there were 515 blast furnaces standing in Great Britain, of which 310 were in blast and 203 idle. This compares with previous quarters of 1908 as follows: March, 312 in blast; June, 308; September, 301. On Dec. 31, there were five new furnaces under construction, and 70 being relined and repaired.

Welsh Coal Miners Object to Mining Machines

SPECIAL CORRESPONDENCE

For some time past there has been unrest among the coal miners of South Wales owing to disputes as to the rate of wages. At the beginning of March, the situation was so bad that a general strike appeared imminent. Fortunately during the last few days an understanding has resulted between employers and the men at the colliery where the trouble originated, and the situation is for the moment less dangerous. There is, however, a possibility of further trouble taking place in the near future owing to the coming into force on July 1 of the eight-hours bill, which as the title implies, limits the working hours of the men. It is anticipated that when this act comes into place, the employers will demand a reduction in the wage, equivalent to the reduction in the hours worked, a reduction which is likely to be resisted by the men.

The situation is complicated owing to a difference of opinion on the part of the counsel as to the effect of the eight-hours bill on the agreement as regards the rate of wages at present in force. This agreement separates the rate of wages according to the selling price. Having regard to this uncertainty as to the legal position, it is obvious that a definite settlement on the wage question may be difficult to arrange and until some settlement is arrived at the Welsh coal trade will be in a critical position. The coal industry of South Wales is of such great importance that a general strike would be a most serious matter. The district produces somewhere about a fifth of the total coal production of Great Britain and the stoppage of the collieries would paralyze a great many important industries, especially the tinplate and the metallurgical works, besides doing damage to the shipping trade of Cardiff and Swansea.

MINERS REFUSE TO WORK WITH MACHINES

As regards the original cause of the dispute between the owners and the men, some interesting information was given by the chairman of the Powell Duffryn Steam Coal company at the annual meeting of shareholders held during the week. It appears that as far back as October, 1906, the managers of this colliery, which is one of the largest and most up-to-date in equipment of all the collieries in South Wales, tried to introduce coal-cutting machinery to work a seam called the Gellideg seam. The men, however, refused to work the new machines. "We tried," says the chairman "over and over again to get the men to come in and test their machines, to test what reasonable men could do in the ordinary way of working in the seam with the coal cutters, but they have,

unfortunately, refused and have put every obstacle in the way of the working of the machines." The dispute was then referred to a conciliation board, but it was not until last December that a report was made and then it was to the effect that no agreement with the men could be arrived at. The next step was the decision of the colliery owners to shut down the colliery, and after due notice had been given, the colliery was actually closed on March 1. Fortunately the dispute was of short duration, and, as mentioned above, the men and the management have during the last few days come to terms and work has again been resumed.

With regard to the introduction of coal-cutting machinery, the management of the Powell-Duffryn colliery explains that this method of hewing the coal is necessary for working certain of the seams. Unless machines are introduced there will be a waste of coal and the life of the colliery will be limited to a much shorter period than would otherwise be the case. The problem is not confined to this colliery but will have to be faced by other mines in the district. The position taken by the miners is extraordinary, especially as it has been shown that with machines, they would earn wages equal to and perhaps in excess of their present wages which are at the rate of \$2.40 a day, a wage which according to English standards is a handsome remuneration for a workman.

The company has been accused of making huge profits and of grinding down the men. The huge profits are not denied, but it is claimed that they have been won more by the sweat of intellect than the sweat of the workman's brow. At all events, some fifteen years ago, the colliery was practically bankrupt and it is due to the skillful way in which it has been managed, to the introduction of electrical equipment, coke ovens, gas engines, and a plant to recover by-products, which installations have made the mine one of the show places among engineering works in Great Britain, that prosperity has been won. That the men are not imposed upon is evident from the wages that are paid.

The refusal to work machines is altogether unreasonable, and the men appear to have recognized the untenable position they have taken up. It is to be hoped that they will be equally reasonable when the time comes to adjust the wage according to the scale of hours for working, laid down statutorily by the eight-hours bill. The shorter hours will chiefly affect the surface hands who have been accustomed to work nine hours. The underground men working on a tonnage basis will probably find that although working shorter hours, they will be able to get out the same tonnage as formerly and consequently will draw the same pay.

It is only fair to add that the situation has been described from the point of view

of the employer. There may be other causes than those mentioned that have produced friction between the owners and the men. There is, however, good reason to believe that the refusal of the men to coöperate with the management in the use of machines is a primary cause of the trouble, and on this point there cannot be much divergence of opinion on the part of the public, as to which side is in the right.

Action of Sulphur in a Gas Coal*

In a general way, about 60 per cent. of the sulphur in coal remains behind in the coke. The amount of gas per long ton of an ordinary Westmoreland gas coal is about 10,750 cu.ft., so that where this coal contains 1.5 per cent. of sulphur we have 0.6 per cent., or 13.44 lb. of sulphur leaving the retorts from one ton of coal. A portion of this passes into the tar, probably over 2 lb. to each ton of coal, leaving in the neighborhood of 11 lb. of sulphur to pass on with the gas. This would give 720 grains per 100 cubic feet.

The great mass of the sulphur leaving the retorts with the gas goes in the form of hydrogen sulphide, the percentage of the sulphur in this form being between 90 and 95 per cent. of the total. The rest is in gaseous sulphur compounds of which the most important is carbon bisulphide. Not all of the so-called sulphur compounds are accounted for by the carbon bisulphide, but the exact constitution of those which remain is by no means certain. Between 80 and 90 per cent. of the sulphur occurs as carbon bisulphide.

The total amount of sulphur which is driven off from the coal is but little affected by the temperature of carbonization, but the form in which this sulphur is in the gas may be profoundly affected by the retort temperature. In a general way as the retort temperature is raised there will be produced more sulphur compounds and less hydrogen sulphide. This has been ascribed to the passage of the sulphur containing gases over the bed of very hot coke, in which passage more than the normal amount of sulphur combines with the carbon to form carbon bisulphide. It is believed by some that the sulphur from the coal is first given off as hydrogen sulphide and that all of the carbon bisulphide formed is a result of the subsequent reaction of the hydrogen sulphide with carbon at a high temperature, the reaction being as follows:

It may, therefore, happen that in the effort to obtain the maximum yield of gas, and, therefore, economy in the production, an abnormal amount of sulphur compounds is formed.

*Abstract of a report by A. D. Little, chemical engineer, Boston, Mass.

The Wolf-Bohres Electric Safety Lamp*

By R. CREMER

The Wolf-Bohres electric safety lamp, fitted with an osram lamp made especially for the purpose, is supplied according to two designs: one arranged to throw the light downward and the other upward. The osram glow lamp will give an equal light, while using slightly more than half the electrical energy required by a carbon lamp. The lamp is fitted with a single-cell accumulator, affording the advantage of a considerable reduction of the weight of the lamp and a more simple treatment of the accumulator. The average length of burning of a 2-volt osram lamp is 600 to 800 hours, against scarcely 100 hours for a 4-volt carbon lamp.

The lamp is fixed in a strong, air-tight glass globe, mounted on the top of, or below, the accumulator, and accessible from all sides. The pure air inclosed between the glass globe and the glow lamp becomes heated by the burning lamp, and its pressure is thereby increased. Should the glass globe be smashed and the glow lamp injured, then the expanded heated air drives back the outer air of the mine, and will at the same time rush into the vacuum of the lamp, causing the filament of the lamp to be instantaneously destroyed. The circuit is thereby interrupted, and the glow lamp extinguished, before an explosive atmosphere has time to enter and to reach the light. Numerous tests made in explosible mixtures have shown that this lamp is safe, under all known conditions prevailing in mines.

The lamp is closed by means of a magnetic lock, which prevents unlawful opening and thereby producing sparks at the contacts. The top and bottom parts of the lamp are connected by slots and projections; and electric contact is formed by sliding two broad spring plates over the contact bridges of the accumulator. The contacts consist of a metal alloy, on which diluted sulphuric acid has a small and slow effect. The opening of the lamp is effected by withdrawing the iron-locking bolt by means of a magnet.

DESCRIPTION OF ACCUMULATOR

The single-cell accumulator is inclosed in a celluloid case. The case fits loosely into the lamp body and is easily removed and replaced. The leads to the contact pieces are bedded in and are acidproof. The filling opening is fitted with a three-chambered screw-closing device, allowing any gas developed to escape, but preventing any acid from flowing out when the lamp is held in inclined positions.

The accumulator is connected up to a simple charging device by plugs. The

glow lamp is fed by the accumulator and glows for a period of 12 hours per charge, yielding a light varying from 1 to 2 c.p. The lamp is 1 1/2 in. in height and weighs, complete, about 4 lb. It is rectangular in shape, and is incased in a tinned sheet-steel body coated with acid-proof paint.

Electric Colliery Winding in England

By T. HINTON*

The views of English engineers on the subject of electrical winding in coal mines may interest American readers. Several distressing accidents involving losses of life have recently occurred in British collieries during the hoisting of men in the shaft. Taking into consideration the conditions, including the depth of the pit, the high speed of the winding and the fact that the cages pass each other in the shaft with but little room between them, it is wonderful that serious accidents are not more common. As it is, they are frequent enough in England, and of a sufficiently serious character, to justify inquiry into the general methods of winding in use in English mines, as compared with the continental practice. The first great difference is that in England, steam engines are almost entirely used for winding, whereas in other European countries, electric power is much more generally used, both for winding and for all other colliery work.

A few electrical-winding engines are at work in Great Britain, and others are now being installed at new mines in South Wales and other districts; however, on the whole, mining engineers in England are unwilling to make any change from their hitherto prevailing practice. This is not due to the want of information and experience, for English mining engineers have repeatedly paid visits in large parties to the continent to see some of the many electrical-winding plants in use in other European countries. Nothing but praise has been heard from them on their return, but with an exception here and there, nothing farther is done. On the continent on the other hand, almost all the new mines of importance are electrically equipped throughout.

ADVANTAGE OF ELECTRICAL HOISTING

The principal advantage of electrical winding lies in the ease and certainty of control. Steam-winding engines are big, powerful machines, with heavy moving parts, difficult to control. The speed of the engine being low, the cylinders have to be large in diameter in order to develop the power required. Furthermore, in consequence of the slow speed, there is a great variation in the angular velocity of the cranks, and the drum has a vary-

ing turning movement, which causes unsteadiness in the ropes. The control of the engine is both difficult and laborious. The driver has a throttle valve, a reversing lever, and a foot brake, all with large and heavy levers to work, and he is kept hard at it for most of his time. The safety of the winding depends entirely on the driver, for no mechanical control gear has been devised efficient enough to be generally adopted. The engineer has to watch the depth indicator, listen to the bell, and work the levers controlling the engine, accordingly.

The engine driver uses his reversing gear as a brake and thus reduces the complication to some extent. Electrical-winding gear, on the other hand, is simple and easy to control. Control is affected by dealing, not with heavy currents in the armatures of the winding motors, but with the small exciting current of the generator field. Dealing with small currents of low voltage, the control gear is light and easily manipulated. Only two small levers are needed, one controlling the winding motor and the other the brake. The direction of the winding is determined by the driver's pulling the control lever either toward, or away from him.

The brake lever and the control lever are interlocked, so that the brakes are released when the winder is started, and they are applied again when the current is shut off. For hoisting men, when a lower speed should be employed than for coal, there is a device which automatically makes it impossible for the driver to exceed a certain speed. Furthermore, a combined depth indicator and automatic safety gear is employed, which prevents the driver from starting too quickly. This device also will automatically bring the control lever to the "off" position and will apply the brakes, should the driver by some mischance omit to do so at the end of the wind.

SPECIAL EMERGENCY BRAKE

A special emergency brake is also used, worked by air pressure, which holds the brakes off as long as all is right. Should the pressure fail or the bank be overrun, the emergency brake is automatically applied and at the same time the current is cut off from the winding motor. The certainty and safety of this gear does not depend on electricity, for as long as the electrical equipment is in perfect order, the winding gear can be controlled in the ordinary way. However, should anything go wrong, for instance, the supply of current fail, or should the driver lose his nerve or fall ill, the emergency brake would work at once. It cannot fail, for the power which holds it off is gone and the brake is applied by the force of gravity.

The electrical-winding gear usually consists of a motor generator fitted with a heavy flywheel and one or two motors directly coupled to the drum shaft. With

*Abstract of a paper read before the North of England Institute of Mining Engineers.

*87 Atlantic Chambers, Manchester, Eng.

lost, but with the electrical gear much of it is saved, as the power used for acceleration at the beginning of the wind is largely regained during braking. During braking, the winding motor acts as a generator, absorbing the power given out by the moving masses during retardation, and reconverting it into power, which is stored in the flywheel of the motor generator.

Electrical winding is perfectly safe and reliable, but it is somewhat expensive in its first cost. The steam-winding engine has worked satisfactorily for many years, and the accidents have been comparatively few. The English colliery engineers and owners whose pits are equipped with the best modern steam-winding engines, cannot reasonably be expected to discard a valuable plant, unless some special circumstances warrant their doing so, but in the case of new mines, especially where electricity is to be largely used for other purposes, it will pay coal companies to adopt electrical driving throughout.

Mine Explosions as Related to Earthquakes

By W. A. SPALDING*

Supplementing my article published in the JOURNAL, Feb. 20, 1909, page 411, I take the liberty of sending an additional list of coincidences and close approximations of earthquakes and mine explosions, covering the time from July 3, 1908, to March 2, 1909.

In those eight months I note 13 striking cases; four actual coincidences; five approximations within one day, and four approximations within a few days.

SUPPLEMENTAL LIST OF COINCIDENCES AND CLOSE APPROXIMATIONS—EARTHQUAKES AND MINE EXPLOSIONS.

1908.

- July 2—Explosion Rikovsky mine, Russia; 214 killed.
- July 15—Explosion, Fottsville, Penn.; 7 killed.
- Aug. 3—Mine explosion, Shenandoah, Penn.
- Aug. 18—Explosion, Maypole colliery, Eng.; 76 killed.
- Sept. 8—Dickson City, Penn.
- Nov. 12—Explosion, Badhoe coal mine, Westphalia; 322 killed.
- Nov. 17—Explosion, Birmingham, Ala.
- Nov. 28—Explosion, Marianna mine, Penn.; 142 killed.
- Dec. 23—Explosions at Trinidad, Colo., and West Brunswick, Eng.
- Dec. 29—Explosion, Lick Branch Colliery, W. Va.; 50 killed.
- July 3—Earthquake, lower Mexico.
- July 3—Earthquake, southern California.
- July 16—Severe earthquake, Chile.
- Aug. 3—Destructive earthquake, Constantinople, Algeria.
- Aug. 18—Severe earthquake, Eureka, Cal.
- Sept. 4, 5—Earthquake, Hawaii
- Nov. 6—Violent earthquake, Plaren, Germany.
- Nov. 7—Moderate shock, Sabatha, Kan.
- Nov. 12—Earthquakes in Missouri and in Belgium.
- Nov. 28—Earthquake, Boston.
- Dec. 21—Two shocks, Montana.
- Dec. 28—Great earthquake, Sicily and southern Italy.

- Jan. 10—Explosion, Zeigler, Ill.; 25 killed.
- Jan. 12—Explosion, Lick Branch, W. Va.; 150 killed.
- Jan. 14—Explosion, Vizprin, Hungary; 61 killed.
- Jan. 19—Explosion, Stone Canyon mine, San Luis Obispo Co., Cal.
- Jan. 25—Explosion, Merchants Coal Co., Boswell, Penn.
- Jan. 27—Explosion, Morrissey, B. C., Can.
- Feb. 9—Explosion, Short Canyon mines, Ala.; 17 killed.
- Feb. 9—Explosion, Catherine mine, near Yuzovka, Russia.
- Feb. 16—Explosion, Stanley mine, Newcastle, Eng.; 168 killed.
- Mar. 2—Explosion, South Creek Slope colliery, Port Griffith, Penn.; 2 killed.
- Jan. 8—Earthquake shock, Messina.
- Jan. 8—Earthquake, western Mexico.
- Jan. 8—Earthquake, Tacoma, Wash.
- Jan. 11, 12—Three earthquakes recorded at Washington, D. C. Earthquakes in Vancouver, B. C.; Washington and Mexico.
- Jan. 13—Northern Italy severely shaken.
- Jan. 19—Heavy earthquake, Asia Minor.
- Jan. 20—Mt. Colima, Mex.; violent.
- Jan. 20—Earthquake, Sinyrua.
- Jan. 20—Earthquake, Sicily.
- Jan. 20—Volcano Laguas, P. I.; active.
- Jan. 23—Destructive earthquake, western Persia.
- Feb. 1—Earthquake shocks, Montreal, St. Petersburg and Messina.
- Feb. 2—Slight earthquake, Owensville, Indiana.
- Feb. 2—Severe earthquake, Saghalien Island.
- Feb. 3—Slight earthquake, Montreal.
- Feb. 9—Heavy shock registered at Naples.
- Feb. 9—Earthquake and eruption at Colima, Mex.
- Feb. 14—Earthquake, Reggio, Sicily.
- Feb. 16—Heavy earthquake, Turkey.
- Feb. 16—Earthquake, Budapest.
- Mar. 2—Fresh Outbreak, Colima, Mex. New crater formed. Shocks southeastern Mexico.

Estimation of Ash in Coke

By HARLEY E. HOOPER*

Some time ago when conducting some tests of coke ovens, I was considerably puzzled by the fact that the ratio of the ash in the coke produced, did not correspond to that in the coal charged into the ovens.

Taking a simple example: Ten tons of coal carrying 5.5 per cent. of ash, was charged in. This produced six tons of coke which, according to the ratio, should have carried 9.17 per cent. of ash, but on analyzing, a result of 11.1 per cent. was obtained. The sample was re-assayed, but practically the same result was obtained. The accuracy of the sampling was then suspected, but a more careful sampling revealed no difference. The columns of coke (beehive) were then sampled in section, but the total gave, approximately, the same discrepancy. Some coke formed in the laboratory way from the same coal, showed a discrepancy, but not to the same extent as that formed on a practical scale.

It was then noticed that the color of the ash from the practical test was darker than that from the laboratory, and this the steam-winding engine the work done in accelerating and retarding the load is

latter was again darker than the coal ash. An analysis revealed far more iron and less silica in the ash from the coke than that from the coal; and this and other considerations led me to suspect iron added, through the abrasive action of the coke on the grinding plate. This latter was the ordinary cast-iron plate as used in most laboratories.

A small sample crushed down in a wedge-wood mortar returned, approximately, the calculated ratio of ash, but this method of grinding was out of the question with the size of the samples required to give an accurate coke-oven test.

Withdrawal of the iron from the mulder-ground sample by means of a magnet was then tried, but owing to the formation of magnetic oxide of iron in the water quenching of the coke, according to the equation

$6\text{FeS} + 6\text{H}_2\text{O} + \text{O}_2 = 2\text{Fe}_2\text{O}_3 + 6\text{H}_2\text{S}$, this later was withdrawn as well, and returned a low result.

ESTIMATES OF EXTRACTION OF IRON IN COKE AND COAL

A series of estimations were then made, of the iron in the coke and coal extracted by hydrochloric acid. These results are given below and show clearly that the iron was introduced through abrasion:

Sample.	Crushed to:	Iron, Per Cent.	Equivalent to Fe ₂ O ₃ , Per Cent.
Coal.....	40 mesh	0.107	0.153
Coal.....	80 mesh	0.121	0.173
Coke (laboratory)...	40 mesh	0.86	1.23
Coke (laboratory)...	80 mesh	0.98	1.40
Coke (oven).....	40 mesh	1.13	1.61
Coke (oven).....	80 mesh	1.37	1.96

These figures would, of course, be slightly high, owing to traces of iron oxides (soluble in hydrochloric acid) originally contained in the samples, but judging from the first estimation 0.1 per cent. would more than cover that amount.

The method finally adopted was to crush the coke in the ordinary manner and assay it for a ash, and b ferric oxide extracted by hydrochloric acid. The percentage of original soluble oxides of iron in the ash had been determined a number of times previously on small samples ground in a wedge-wood mortar, and since it averaged about 3 per cent. (of the ash), this figure, being a minor factor, was used.

An example will serve best to show the method of calculating the result:

Data.

Total ash, got by ignition of coke..... 10 per cent. (of the coke)
 Ferric oxide extracted by HCL..... 2 per cent. (of the coke)
 Oxides of iron (originally in ash)..... 3 per cent. (of the ash)
 Let X = the true content.
 then $X = 8 + \frac{3}{100} \text{ of } X$
 or $X - \frac{3X}{100} = 8$
 $X = 8.24$.

From the above it will be seen that in the usual methods of estimating ash in coke an error of about 2 per cent. is incurred and this when dealing in coke in large quantities is a serious item.

Impressions of a New Ontario Camp—Gowganda

The Silver Minerals Resemble Those of Cobalt but the Veins Occur in Diabase and Not in the Huronian Rocks as at Cobalt

B Y H. E. W E S T*

That the Cobalt silver mines are now so well known to the mining world is largely due to the railroad facilities connecting it with the several important cities of eastern Canada and the United States. The more recently discovered "Montreal River section," owing to the lack of such railroad communication, is correspondingly less familiar. Particularly is this true of the western section known as Gowganda, which until the first month of the present year was inaccessible except by the canoe route in summer—70 miles from Elk lake, with 18 portages—or in winter over a forest trail 34 miles in length.

The important discoveries by Mann and Reeves were made in the early days of August, 1908. In September there was a rush by way of the Montreal river, when much of the ground in the Gowganda district proper was staked. My acquaintance with Gowganda was made about the middle of December, 1908, when, with a party of eight we made the trip from Elk lake over the newly cut road as far as Long Point, thence by toboggan and "pack-sack" over the unbroken and timber strewn trails to the shores of Gowganda lake.

DIFFICULTIES OF THE TRAIL

This little journey occupied one week, as we were heavily laden, and the rough portages necessitated unloading the toboggans, packing the freight, doubling back, etc., so that there were days when four miles seemed a fair day's work, and all hands were glad to make camp. At that time there was no provision for shelter on the road, and each night the tent had to be pitched and camp made, an operation, taken together with packing each morning, which consumed a large portion of the short winter's day. We arrived at Gowganda on Dec. 16, and camp was made on the shore of the north-west arm east of the Mann claim.

The impressions of the trail and of our first days at Gowganda will never be effaced from my memory. Our little party seemed alone in its human activities and all around the lake the dark, pine forest crowded to the shore. Not a sound was heard, nor was the welcome smoke of any camp fire seen save our own. The place seemed deserted and lifeless, which for a camp so much in popular favor as Gowganda caused the inevitable early impressions that the district had been much overrated. Occasionally men were visible in the distance, strung out in Indian file

across the lake, leaving to spend Christmas outside and looking for all the world like a flock of homing geese against the wintry sky.

On further investigation of the neighboring woods, some men were encountered in isolated camps, but there were comparatively few who spent their 1908 Christmas at Gowganda. What men were coming into the district were heading northward for Obuskong and Diabase lake, while our party went south visiting Hanging Stone, Frying Pan and Elk-Horn lakes. The slush on the ice of this latter lake was so thick that it became impossible to drag our toboggans. We could make but one mile an hour and that with killing work, so that finally the attempt to reach Duncan lake, 25 miles farther by the lake route, was abandoned. A permanent camp was established and others of the party returned for fresh provisions.

It was apparent that no considerable number of men could operate for any period far from their base of supplies, since the carrying power of the party was limited to the capacity of the individuals, the transported supplies lasting two or three weeks at most. This meant the packing in of supplies of consumption rather than those of utility, such as dynamite, steel, etc., thus accounting for the slight development accomplished, or that was in progress at that time.

WAGON ROAD OPENED

When the government road was pushed through to Gowganda lake—and this important feature was accelerated by the energetic action of the several claim holders, whose roads antedated the completion of the government road a month or six weeks—teams were able to haul in supplies in quantities, and it was not long before the entire camp took an entirely different aspect. Labor became more plentiful, clearings were made, log houses put up, roads constructed and camps established. Development, of which practically none had been done previously, was no longer neglected and several shafts were started on promising properties.

Since the opening of the road early in the present year the main object has been to freight in supplies and machinery, so that active work might be instituted and carried on throughout the summer. To this end the leading properties are endeavoring to accumulate a stock of supplies sufficient for nine months—until winter roads are again available. It must be understood that the present road is suitable for

winter travel only, as a considerable portion of the lake has been utilized for this route. The matter of a suitable summer road, though under discussion, is still undecided.

TRANSPORTATION PROBLEM

The question of railroad connections with both Charlton, the present head of the T. & N. O. railroad, and Sellwood, on the Canadian Northern Ontario railroad, is being actively canvassed. There is no question that railroad connection is essential to the opening up of the mines of the Montreal River section. In fact, without a railroad to bring in supplies and transport ore, there is not a mine that can hope to make payable returns.

That road transportation cannot cope with the problem is proven by the fact that, although there were over 600 teams between the railroad at Charlton and Gowganda, no surplus of supplies has yet been collected at the latter point. The demand of the host of prospectors in the woods estimated at 5000 men is equal to the supply of provisions the two roads are capable of delivering. Machinery and mining supplies are moreover engaging a considerable proportion of the available teams. The freight rate from Charlton to Elk lake, a distance of 24 miles, which was until recently 50 to 60c. per 100 lb., has been raised to 75c. or \$1. From Elk lake to Gowganda it is \$3 per 100 lb. for a distance of 34 miles.

Leaving the question of transportation, it may be of interest to pay some attention to the claims of Gowganda as a mining district. My personal experience of Gowganda, up to March of this year, has been confined entirely to the southern half, and from Gowganda to Elk Horn lakes. As this area, about two miles square, comprises all the better known properties, it will be a guide in estimating the probabilities of this new mining camp as a future producer of silver.

From the Boyd-Gordon on the north to the Bartlett mine on the south, all of the properties on the "ridge" may be included in the prospective list of Gowganda's silver producers. These "ridge" properties include the Mann, the Reeves-Dobie, and the Welsh claims. The Milne, Armstrong Fraction and Crawford claims abutting the "ridge" may also be considered of prospective value. All these properties lie either entirely or partly across the ridge of diabase composing the "backbone" of the peninsula.

*Mining engineer, El Oro, Mexico.

ROCK FORMATION AT GOWGANDA

The rock formation of Gowganda is not dissimilar to that of Cobalt. There are the same coarse conglomerates, angular clastic agglomerates, slate-graywacke and quartzite, all members of the Huronian series, with diabase appearing at the surface in narrow bands, usually striking northwest-southeast. From the frequent change, in parts, of diabase and slate it is not unlikely that diabase may be found the underlying rock in several areas now covered by members of the Huronian series. In Cobalt, this underlying or fundamental rock is Keewatin. At Gowganda I should judge a considerable area of the surface Huronian rock to be underlaid with the intruded diabase. In other words, that in parts the Huronian rocks are superficial and at moderate depth the fundamental rock will be exposed—be that what it may. Rocks of the Keewatin horizon do not appear conspicuous in any part and are absent in the southern half of the district.

BEST VEINS IN DIABASE

The striking point of dissimilarity between the Cobalt and Gowganda districts lies in the fact that in the former the conglomerates and graywacke-slates of the Huronian series contain the majority of the proven veins. At Gowganda no deposits of merit have yet been proven except in the diabase rock. Just why this radical distinction occurs—if this be a correct interpretation of surface phenomena—is difficult of comprehension.

So far as proven then the diabase is the favored formation; the coarser crystalline variety, gabbro, is prevalent, in which occur the aplite veins or dikes for which the entire Montreal River section is noted. Aplite, in the textbooks given as a mica-less or one mica granite (muscovite), is here perhaps more correctly regarded as a later intrusion of the same magma as the diabase, by differentiation, filling the secondary fissures in the diabase with a light colored rock usually pink from a contained feldspar, from which the darker silicates of the diabase are lacking. Feldspar, quartz and calcite are the main constituents, with "aplitic" texture, forming what is termed the diabase-pegmatite.

THE VEIN SYSTEM

Throughout the district the vein system is marked by two sets existing at right angles to each other, one set of veins striking roughly north-south, with the other east-west. More correctly speaking, however, these veins are usually east of north, or approximately northeast, with the other set south of east, or southeast. At the surface in several of the properties mentioned, veins carrying metallic silver are observed. Such veins are in no instance more than a few inches wide. Usually 1 to 2 in. represent the rich silver portion, although between the walls the fissure may measure from 10 to 12 in. The re-

maining portion carries a certain amount of leaf silver and usually is characterized by "cobalt-bloom." This enrichment may extend also into the walls for a few inches.

So far as developed, there exist no duplicates of the massive native silver veins such as are visible even today at Cobalt, at the Lawson, La Rose, of Temiskaming and Hudson Bay properties. Of course, these latter are phenomena not often met in any part of the world, and it is not necessary that such should exist at Gowganda. There is sufficient evidence of an encouraging nature already exposed. Massive smaltite and niccolite occur, but usually the richer silver veins are sparsely accompanied with these accessory minerals.

THE VARIOUS PROSPECTS

The deepest development thus far at Gowganda is in the shaft on the Boyd-Gordon claim. This shaft is down about 45 ft. In it are exposed three veins, one of which for an inch or two in width carried native silver. Smaltite is in considerable evidence in the other veins with small silver content. One hundred bags of ore containing from 3000 to 6000 oz. of silver per ton have been bagged during the sinking of this shaft. The shaft is in diabase.

On the Mann claim two shafts are being sunk, the northern one down about 12 ft. and the southern about 25 ft. deep. A vein from 1 to 3 in. wide, carrying in places considerable native silver, is seen against the north wall. All these veins are members of the east-west type. In the Reeves-Dobie claim, except for the credible report of rich surface showing, with some chunks of metallic silver to prove the assertions extant, nothing is at present open to inspection. The Welsh property has, it is claimed, some 50 veins and fractures in the two claims of 70 acres; two of these veins carrying native silver. These claims are trenced at the surface extensively, with a few pits sunk on the first exposure.

NARROW VEINS WITH ENRICHED WALL ROCK

In the four southern blocks of the Bartlett claim exist some excellent surface showings of native silver. I remember one particularly that I saw in December last that was exposed for about 50 ft. In places the vein was 12 in. between the diabase walls, the silver streak averaging from 1 to 2 inches in width carrying probably 3000 to 6000 oz. per ton of ore, the balance of the vein containing leaf silver. The walls doubtless contain leaf silver for a few inches, or possibly a foot from the silver streak.

To the west the vein was seen cutting through the polished glaciated surface of a diabase bluff. Six feet to the south was an intrusive aplite vein about 18 in. wide. Joining the two veins were cracks or joints in the diabase, about $\frac{1}{8}$ in. wide and

filled with sheets of silver. The appearance was striking and up to the present the most promising exposure I have seen at Gowganda.

All veins are not of these narrow dimensions. In one of the Crawford blocks running into Crawford lake is a vein of calcite fully 6 ft. wide. Beyond a sparse occurrence of chalcoppyrite and galena the vein at the surface is thus far barren. It is in the narrow veins with the enriched wall rock that the payable deposits are found.

DEVELOPMENT NECESSARY

With the numerous veins exposed, several of which show native silver in mass and leaf form, all the claims situated on the "ridge," or touching thereon may be considered as possessing bright prospects of being converted into payable mines. Depth is required to prove the persistence of these silver veins in the diabase and depth is that factor, more than all else, that only time and work discloses.

The fact that veins "tight" at the surface open out encouragingly a few feet below proves nothing conclusively. At 100- or 200-ft. depth, facts as to vein enrichment begin to be ascertained. Indications at the surface are favorable. If these are confirmed with developments at moderate depths, profitable silver production at Gowganda is assured.

In addition to the "ridge," another area of diabase extends south of Gordon lake, westward to the Elk Horn lake. Here also are some promising properties in prospect. The Gowganda section possesses many claims on which strong and persistent veins are disclosed. The summer's development, however, is needed to prove just what the pretensions of this section justify. Notable silver discoveries have not been authentically reported up to the present time.

RAILROAD CONNECTIONS ESSENTIAL

Whatever developments may disclose, Gowganda's mines cannot become producers until facilities are obtained to bring in supplies and export ore. Without railroad connections, Gowganda's mines are not capable of profitable production. The mines at most can be developed to the producing stage. This, in most cases, will occupy a year or two's work, and after that period shipments of ore may be expected.

As yet nothing has been determined to solve the much-needed problem of transportation. Schemes are on foot to connect Elk lake with the T. & N. O. railroad at Charlton, and Gowganda with the Canadian Northern Ontario railroad at Sellwood, and also to connect these two centers. Meantime, no definite railroad construction has been decided upon. People criticize the Government's seeming apathy, but many support the conservative view that time is necessary to prove the prospects and justify the building of railroads.

When it is remembered that a large amount of money is being invested in the Montreal river section by capitalists of Canada, America and England, whose calculations are primarily made on obtaining transport facilities (without such it is a difficult matter to ever develop these claims to the producing stage) it seems reasonable for the Government to display no less enterprise, and after a preliminary investigation to energetically provide the means of communication essential to the community.

This argument is further strengthened in view of the considerable revenue the Province of Ontario derives from the numerous phases of the mining industry. The mining community, justly or not, has a decided opinion that many of the sources of revenue are extortions and from the considerable revenue derived it receives an inadequate return.

When a new mining industry is grafted on a province devoted mainly to agricultural and allied interests, it is invariably the case that the mining interests are subordinated to the vested interests. This was amply demonstrated in the early days of Victoria, when the friction between mining and older interests in that colony became so acute that the mining community decided on separation. This movement ended with the deplorable incident of the Eureka stockade—an episode well known to all mining men conversant with Australian history.

Whatever the individual view held on the policy of the Government, I think all mining men who have inspected the Montreal river section will agree that in this section, and especially the Miller and Gowganda districts, are many favorable prospects that promise to become mines. At the same time it is certain that not one of these embryonic mines can become a steady producer of silver without the assistance of the railroad. It would, therefore, seem to be the duty of the Government to provide the means whereby these latent assets can be quickened into life, and increase the silver production of Ontario.

It appears that in the realms of possibility the whole Montreal river section might, within five years, equal the present production of Cobalt, but this must be based on the two assumptions that railroad construction is commenced forthwith and that the development of the mines at depth is not less favorable than at the surface.

According to the government report the estimated number of persons employed in and about the mines of New South Wales during 1908 was 38,780, or 4900 less than in 1907.

According to *Queen. Gov. Min. Journ.*, the value of the tin and tin ore of New South Wales, obtained during 1908, was £205,447

Filtering Gold Slime

BY EILER JENSEN*

In small cyanide plants where a clean-up press is not provided, the filtering and washing of the gold slime after acid treatment of zinc is generally found to be a slow and tedious process, but the following arrangement can be very cheaply installed. It will save much time in the clean-up, and is, in fact, with small plants, a good substitute for a filter-press. The whole operation of washing and filtering can be done in the acid tub, and consists simply of applying the principle of vacuum filtration to the clean-up. The appliances necessary are a filter frame, a vacuum chamber and a vacuum pump.

The frame is constructed of $\frac{3}{4}$ -in. piping, screwed together in the form of a square, with a T-piece let into one of the sides, to which pipe and hose can be fitted; the sides of the pipes toward the center have $\frac{1}{4}$ -in. holes drilled every 6 inches. A

ning out clear acid solution; this should be placed six inches above the bottom of the drum; *D*, cock in center of bottom for cleaning out drum. Pipe *B* is carried down one foot inside the drum, so as to obviate the carrying over of any of the acid solution through pipe *A* to the vacuum pump. Drums with convex ends should be chosen as they can be thoroughly drained when cleaning out.

After the acid treatment is finished, the tub is filled with water, and the contents well stirred, then after the precipitate has settled, the clear solution is decanted off. The remaining gold sludge is well stirred and the frame is put into the tub, and the cocks to the vacuum chamber and pump are opened. The frame should lie horizontally on the bottom of the tub and remain there until all the liquid is drawn off; it can then be lifted from the bottom and placed upright against the side of the tub while sufficient water is run in for washing. The slime adhering to the frame is scraped off, and, together with the rest

APPARATUS FOR FILTERING ZINC PRECIPITATE

filter cloth to fit the frame is made of two pieces of good canvas or cotton duck, between which are two layers of coarsely woven cocoanut matting. The four layers are all held together by a few rows of stitchings, about 3 in. apart. The cocoanut-mat layers are made so as to fit easily inside the frames, the duck being left large enough so that the top and bottom layers can overlap the frame on opposite sides and can be well sewn together all round. This then forms an efficient cell for filtering solution. The frame is made of such size as to fit the bottom of the acid tub with about 2 in. clearance all round.

The vacuum chamber can be conveniently made from a sulphuric-acid drum, fitted with pipe connections as in an accompanying illustration. *A* is a pipe with cock to vacuum pump; *B*, pipe with cock and hose to filter frame; a cock *C* for run-

of the slime in the bottom of the tub, is thoroughly stirred up with the water. The frame is again laid horizontally on the bottom of the tub and the vacuum cocks are opened as before. One washing in most cases will be ample, but can easily be repeated if insufficient. After the liquid is all drawn off, the vacuum is maintained for a time so as to air-dry the slime as much as possible. The slime is then collected from the frame and from the bottom of the tub; with careful scraping very little need be left on either. What is left can, however, be collected by washing and sponging the tub and frame with about half a bucketful of water. The washings can then either be filtered through a small calico filter, or use may be made of the filter frame, by laying it down flat and, with the vacuum on, slowly pouring the washings upon one side of it; when dry the slime is carefully scraped off. If the filtering is slow with only one frame, there is no reason why two or more should not be used.

NOTE.—Abstract of an article in *Journ. Chamber of Mines of Western Australia*, p. 423, November, 1908.

The Mineral Production of Maryland in 1908

By WM. BULLOCK CLARK*

The statistics gathered by the State Geological Survey, acting in coöperation with the Division of Mineral Resources of the U. S. Geological Survey in Maryland, show clearly the effect of the business depression arising from the difficulties in the money market during 1908. The depression is especially noticeable in the larger industries; some of the smaller ones, like flint and feldspar, sand and gravel, show a satisfactory increase. The statistics collected to date are practically complete with the exception of a few small operators. The total value for the year is \$8,591,817 or about 78 per cent. of the normal annual production.

COAL

The production of coal in 1908 amounted to 3,908,120 long tons, the legal standard in the State, or 4,377,093 short tons valued at \$5,116,378. These figures show a decrease of 1,031,726 long tons as compared with the production of 1907 and the value has been correspondingly decreased \$1,507,319. This is an unusually heavy reduction in the annual production, representing the lowest valuation since 1901. The average price per ton was the same as in 1907, viz., \$1.34 per long ton. The coal from the "Big Vein" or Pittsburgh seam of the Georges Creek Valley sold at prices from \$1 to \$1.80 per long ton, the average being about \$1.38.

The relative production of coal from the different seams remains about the same, but there appears to be an increasing interest in and development of the "small veins" as the "Big Vein" coal approaches exhaustion in some of the well known mines. The conditions during 1908 were not favorable to the development of new properties in the small-vein coals.

BUILDING STONE

The building-stone industry suffered less during the depression than the coal on account of the increased use of crushed stone for concrete and road construction. The total value of the stone produced during 1908 was \$1,045,880, as compared with \$1,555,415 in 1907, or a decrease of \$509,535. Much of this decrease is directly due to the completion of the construction of the McCall Ferry Power Company's immense dam across the Susquehanna river. The decrease is only temporary since there is every prospect of a greatly increased production next year from the use of crushed stone in the filtration plant of Baltimore and the State roads system recently inaugurated.

*State geologist, Baltimore, Md.

CLAY

The production of clay and clay products during 1908 was considerably less than that for 1907. The total production for the year is valued at \$1,452,259, or a decrease of \$463,979 from the figures of the preceding year. The production for 1908 is somewhat below that obtaining prior to the marked increased demand resulting from the Baltimore fire. The figures given include the brick, tile, pottery and raw clay.

LIME AND CEMENT

The production of lime and cement during 1908 was almost the same as that for 1907, the lack of change being due to the practical extinction of the natural-cement business and the beginning of operations of a large portland-cement plant near Hagerstown. The lime-burning industry remained unaffected by business depression, the reaction in the lime industry usually occurring a year later than with the other mineral products. The value of the production of lime and cement during 1908 was \$332,445 as against \$334,316 for 1907.

SAND AND GRAVEL

The production of sand and gravel shows a marked increase over that reported for 1907, which is doubtless due to the continued increase in the use of cement and the consequent demand for these products. Most of the sand sold is obtained from the Coastal Plain deposits or by dredging the tributaries of the Chesapeake. In one instance disintegrated crystalline dolomite is employed with success. The total production for 1908 is valued at \$402,966 as against \$268,048 for 1907.

FLINT AND FELDSPAR

The production of flint and feldspar during 1908 was greater than in 1907 but not as great as that of 1906. The total production for 1908 is valued at \$104,563 as against \$90,860 for 1907. Of this production feldspar represents two-thirds and quartz one-third. The feldspar output is chiefly in ground form as is also true for the quartz.

ORES

The production of the metalliferous ores in Maryland is so small as to affect but little the State's total mineral output. Gold and copper are found in small quantities and there is generally a small production each year of one or both of these ores. The industries based upon them are, however, not well established and the returns frequently are less than the outlay. The iron ore, on the other hand, has been one of the most important metallic products in the State. With the closing down of the Muirkirk furnace there has been a complete cessation of mining the carbonate ores of the eastern counties. This has been offset in part by some revival in

the mining of the brown hematite ores in the Piedmont, especially in Carroll and Frederick counties. Most of the deposits are relatively inaccessible, such ore as is mined being shipped to furnaces in Pennsylvania. The total production of all the ores, gold, copper, iron and mineral paint amounted to only \$37,758 in 1908 against \$37,767 for the same materials in 1907.

MISCELLANEOUS

Under this heading are included talc, soapstone, diatomaceous earth, or tripoli, mineral waters and marl. The production of mineral waters shows an apparent decrease in quantity and value, due in part to closer inspection of the statistics. The value for 1908 being \$75,858 as compared with \$110,039. The production of the remaining materials is slightly less than \$25,000.

Nipissing Mines Company, Cobalt

The president's report April 20, 1909, shows that the record for 1908 is as follows: Shipments of ore, 3505 tons, of which 702 tons were high-grade ore containing 3155 oz. of silver per ton, with 10.01 per cent. cobalt, 5.48 nickel and 37.69 arsenic. The remaining 2803 tons contained 210 oz. of silver per ton. The total net value of the ore shipped was \$1,363,783. The cost of producing silver, per ton of ore, in 1908 was as follows: Operations, \$105.46; depreciation at the rate of 24 per cent. on the plants and buildings, \$13.03; marketing ore, \$51.02; corporation, legal and other expenses, \$6.50; less income from rents, etc., \$8.10, or a total cost of production, \$167.91, which, based on the amount of silver produced, is \$0.20715 per ounce.

The exploration work for the year exposed much new ore, and on Jan. 1, 1909, the ore reserves were estimated at \$1,078,000. During the year 10,013 ft. of underground work was done through 12 shafts and two tunnels. The company owns 846 acres of land, 383 acres of which have not been prospected. Since Jan. 1 a rich vein has been found in the Fourth of July and No. 64 shafts. The total dividends paid by the company since it began operation four years ago is 44 per cent. on the capital, or \$2,640,000.

The report of the United States Steel Corporation for 1908 gives the following figures for the export sales made, in long tons:

	1907.	1908.	Changes.
Pig iron and scrap.....	21,898	1.	21,898
Finished steel.....	1,014,014	777,276	D. 236,738
Miscellaneous.....	68	232	I. 164
Total.....	1,014,082	799,406	D. 214,676

Comparing these with the total exports, we find that the Steel Corporation in 1908 furnished 87 per cent. of the total exports of finished steel, and 47 per cent. of the pig-iron exports.

Three Thousand Horse Power Winding Engine

Details of a Coupled High Pressure Type to Operate at 150 Lb. Steam Pressure and 50 Deg. Superheat; Safety Gear of the Whitmore Type

BY J. B. VAN BRUSSEL*

The winding-engine plant illustrated herewith has recently been installed in an English colliery. The engine is of the coupled high-pressure type, each cylinder being 36 in. diameter and 72 in. stroke. The cylinders are joined directly to the engine-bored guides and under the piston rods are supporting brackets. The back covers are easily removable for the pur-

pose of examining the pistons. Provision is also made on the supporting feet of the cylinders to allow for expansion to take place in a straight line. To make this possible the holding-down bolts of the cylinders are separate from the foundation bolts. The cylinders are constructed for a working pressure of 150 lb. and superheat of 50 deg. Fahrenheit. The cylinder body and steam chest are well protected with nonconducting material and covered

with blue-steel plates secured by polished bands. The valves are lifted and released by levers actuated by eccentrics driven from the lay shaft running the same speed as the engine and parallel to the engine frame. An auxiliary eccentric is placed by the side of each trip lever eccentric to vary the cut-off by means of a cam lever

and allow the pistons to work with the minimum amount of clearance.

The governor, which is of the static type, is driven by a roller chain from the engine shaft, the governor being coupled to the trip motion by cross-shafts and bevel gearing and so arranged that the reversing hand lever can be left at full gear, the governor automatically varying

A 3000-HORSEPOWER WINDING ENGINE AT AN ENGLISH COLLIERY

pose of examining the pistons. Provision is also made on the supporting feet of the cylinders to allow for expansion to take place in a straight line. To make this possible the holding-down bolts of the cylinders are separate from the foundation bolts. The cylinders are constructed for a working pressure of 150 lb. and superheat of 50 deg. Fahrenheit. The cylinder body and steam chest are well protected with nonconducting material and covered

*Brussels, Belgium.

which is also under the control of the governor. The grades of cut-off vary from 0 to 80 per cent., and steam may also be admitted up to 60 per cent. of the stroke when not under control of the governor. The exhaust valves are similar in design to the steam-inlet valves, and are actuated by means of rocking levers worked from the steam eccentric, thus giving a full exhaust under all grades of cut off. The valves are so placed as to effectively drain the interior of the cylin-

the steam admission. The governor is so set that the engine speed cannot exceed 50 r.p.m. The reversing is effected from the driver's platform by a hand lever capable of easy movement. This hand lever is connected to the steam-reversing engine with floating lever attachment, in order that the reversing gear may promptly take a position corresponding to the driver's reversing lever.

On the reversing shaft is placed a lever and rod connecting with the governor

transmission shaft, and thus disconnecting the governor from the cut-off gear when reversing. Provision is made to throw the trip gear to full-steam position to enable the steam reversing to be effective even when the engine is running full speed in the opposite direction. A safety gear of the Whitmore type is fitted to this engine, which shuts off steam from the engine and applies the brakes, thus preventing the possibility of overwinding if the attendant fails to shut off steam, or starts the engine in the wrong direction.

A steam separator 3 ft. in diameter by 9 ft. long is placed between the cylinders and is followed by a 12-in. parallel slide valve. The main throttle is placed next this valve and is of the equilibrium type with cast-steel body. The engines are fitted with a most efficient system of drain gear and all the valves and handles are in a convenient position for ease in working.

The winding drum is of the built-up type, with channel-steel arms firmly secured to cast-iron bosses. The form of the groove is such that slipping of ropes is reduced to a minimum. The brake paths are faced with steel plates and arrangements made for adequately ventilating same and keeping cool when running on the brake. The drum is arranged for two ropes, each rope commencing on a flat 13-ft. diameter, then continuing up a slow core to 14 ft. diameter, then running up a spiral to the cylindrical portion of the drum, which is 17 ft. in diameter. The distance between the flanges of the cylindrical portion is 7 ft. 6 in. in the clear.

The brakes are operated by a vertical engine and weights. The brakes are put on by the weights and released by the engine, the engine being fitted with a system of floating levers whereby the position of the piston and consequently the degree of intensity with which the brakes are applied can be varied at will. The position of the piston corresponds to the position of the lever on the driver's platform. The brake engine is also coupled to the overwinding device and, as in the case of the former, the steam is cut off and the weights apply the brakes.

The depth indicator is arranged so that 1 ft. movement of the cages is represented by at least 1 in. of the pointer of the barrel. It is also provided with gong to ring at approved periods before the end of each of such wind. The driver's platform is on the left-hand side of the engine. All the operating levers are here handily arranged for controlling the throttle, reversing, brake engine, drain valves, etc.

The leading dimensions of the engine are: Diameter of cylinder, 36 in.; stroke, 72; diameter of piston rods, 7; diameter of crank bearings, 18; length of crank bearings, 32; diameter of crank pin, 10; length of crank pin, 12; diameter of crank shaft in drum, 22; diameter of gudgeon, 8; length of gudgeon, 12; length of connect-

ing rod, 15 ft.; diameter of connecting rod at ends, 7 and 8 in.; diameter of connecting rod in middle, 9 inches.

The West African Goldfield

The West African goldfield of Gold Coast Colony has been attracting considerable attention in London of late, and the shares of the producing mines, as well as those of companies owning undeveloped properties, have been bought. The Consolidated Goldfields of South Africa Company, Ltd., has given a lead in drawing capital toward this goldfield, which up to the present has given disappointing financial results, by guaranteeing a large amount of money, about £250,000, for opening up new properties. This mark of confidence in the future success of the field has been prompted, it is said, by favorable reports from Walter Broadbridge and J. H. Curle. The results obtained by the producing mines do not call for any great enthusiasm. Although a good deal of gold is produced the dividends have been insignificant. For the last three years 1906, 1907 and 1908, the value of the gold produced has been £877,568, £1,154,885 and £1,186,342 respectively. Last year the Abosso Company alone distributed a dividend. Up to the present the cost of working has been high compared with the Rand; owing partly to the bad climate which causes difficulty in securing efficient management; and partly to the small scale of operations, the largest mill on the field being one of 50 stamps. If the mines can be worked on a larger scale, costs will no doubt be reduced, but to do this a large amount of development work and a considerable outlay are required. The thickness of banket on the West Coast compares unfavorably with the Rand and a far greater footage of development will be required for a given tonnage. Then again the continuity of the West Coast banket as a payable ore deposit is still uncertain. It may be found that the beds are workable only in certain portions, and that in between the reef may be too narrow or too poor to work at a profit.

A map of the West Coast banket area is marked off into blocks much the same as on the Rand and an enthusiastic speculator, who figures out tonnages as on the Rand should bear this point in mind. With increased outputs a reduction in grade may be expected. In examining the statistics of the producing mines, it will be seen that there has been a great falling off in the yield lately compared with the yield obtained at the commencement of operations, a sign that the mines were started on a grade above the average.

Although the field has undoubted possibilities, it would be unwise to look upon it as a second Rand, and those who are finding the money for its further develop-

ment would do well to concentrate their efforts on the best known portions of the banket.

The Peat Fuel Industry of Canada

A memorandum prepared by the Dominion Superintendent of Mines and presented to the Canadian House of Commons, gives some information relative to the peat-fuel industry of Canada and its possibilities substantially as follows:

The high prices of imported coal in the middle provinces of Canada, the depletion of our forests, together with the increasing value of the forests for other purposes, and the suffering induced on account of scarcity of fuel in recent years consequent upon labor conditions are causes which have again prominently brought forward the question of utilizing peat bogs and lignite deposits for the production of marketable fuel and other purposes.

The estimated area so far reported distributed over the different provinces of the Dominion is 37,000 sq.m. The areas covered by peat bogs in the different provinces are, in square miles: Nova Scotia, 250; Prince Edward Island, 10; New Brunswick, 250; Quebec, 500; Ontario, 10,450; Alberta and Saskatchewan, 25,000. The beds vary from 5 to 10 ft. in depth. Further investigation will undoubtedly prove that this estimate represents but a fraction of the total area available.

Although several attempts have been made to manufacture peat fuel, especially in Ontario, they have, as a rule, resulted in failures, due principally to lack of knowledge. The successful working of peat bogs and manufacture of the raw peat into marketable fuel depend on:

1. The proper classification of the different peat bogs, since the peat occurring in one bog might be suitable for peat-fuel manufacture, while that from another might not.

2. The treatment of the raw material and the apparatus used for its combustion either for domestic or industrial purposes.

These facts, upon which the whole success of the industry depends, can be determined only by experiments carried out on a commercial scale and in an intelligent manner.

In several European countries peat is used largely for domestic and industrial purposes with satisfactory and economical results, and as conditions in Canada are quite as favorable for the manufacture of peat fuel and the use of lignite, there is no reason why, with the employment of proper methods and latest ideas, peat-fuel manufacture and use cannot be successfully introduced into Canada.

The memorandum recommends the establishments of a government testing and experimental plant, where the values of these fuels could be demonstrated and investigated.

Colliery Notes

An explosive mixture of firedamp ignites at a minimum temperature of about 650 deg. C. It must be exposed to this temperature for about 10 sec., however, before ignition takes place.

In one German district where safety lamps are used exclusively, the cylinders of the lamps are now made of a specially patented hard glass. This increases the cost of lamp 40 per cent., but prolongs its life 83 per cent.

In putting down boilers, it is advisable to see that the under strata is dry, and to put in a concrete foundation, covering the length and breadth of the space occupied, not only by the boilers, but also the outside walls forming the house and flues. The best kind of a sludge drift leading away from a boiler house, is built of large earthenware pipes, laid in good concrete.

There is no longer any question that coal dust will explode and damage a mine that is free from gas. One writer has aptly said: "Gas will always bear the relationship to coal dust that the detonator does to the high explosive, even though the latter in each case does most of the damage, and can usually be exploded in the absence of the former."

Coal miners generally believe that black-damp is any mixture of gases which is heavier than air, non-explosive, extinguishes a lamp, and does not cause any noticeable effect on the miner when mixed with sufficient air to allow a lamp to burn. In investigating this subject it has been found that an atmosphere, which is extinctive to lamps, may be lighter than air. Such a condition may occur when the atmosphere is a mixture of nitrogen and carbon dioxide, in which the quantity of CO_2 is so small, that the mixture is lighter than air. A similar condition will exist if the mixture contains less oxygen than is necessary to support combustion, and a percentage of firedamp above the explosive limit.

One question that often arises is, whether the ventilation of a mine should be maintained even when the pit is not working. In this connection it is always best to see that ventilation is constantly produced, even when the pit is idle. In many countries (England, for instance) the mine laws specifically state that ventilation shall be maintained at all times, unless the mine is abandoned. Any mining man of experience must realize that the policy of constant ventilation is the only sensible plan to adopt. It is always easier, in dealing with a large quantity of gas to remove it little by little, than to try to remove it all in a body. What the blood is to a man as it courses through his body, so is the ventilation to a mine

When a central rescue station is established to serve a group of collieries, the station should be in direct telephonic communication with every colliery within its radius by means of a private wire to each; the telephonic line between each colliery and the station should be tested daily and the tests recorded in a book at the station where at least one assistant should be continuously on duty. Those who oppose the establishing of rescue stations do so on the ground that prevention is better than cure. Although explosions can be prevented, they continue to occur, and it is certainly wise to spare no reasonable expense in properly equipping such central stations, so that when the unexpected does happen, perhaps hundreds of lives may be saved.

Much care should be observed when electric motors are installed underground. American operators could learn much from observing the practice in continental mines, where the chambers for motors are constructed with water-proof arched roofs and tiled pavement; everything being as clean underground as is usual in surface plants. If the arched roof in such a chamber does not prevent the dripping of water, it is then best to have recourse to inclosing covers, which should be of the weather-proof ventilating pattern, and easily opened for examination of the windings. Totally-inclosing covers, admitting of no ventilation, prevent the accumulation of dust, but interfere with the cooling, and necessitate the use of large types of machines in which the material is insufficiently utilized, with a consequent lower efficiency and higher price.

Concerning the question of forced draft, a considerable diversity of opinion exists. In a new system of forced draft recently put forward, the steam is taken direct from the boiler and led by pipes into the side flues, where it becomes superheated, and is then carried to the air injectors, where it draws in and mixes with air, giving up to it a portion of its heat, and drives it into the fire, on each side of the door at a point a few inches above the dead plate. On one side of the injector apparatus a pipe is led from the flue direct, and in addition to the air, heated gas is also drawn in, so that a mixture of superheated steam, air, and heated gases is delivered into the fire at a high temperature. Tests with the apparatus have shown an increase of 30 per cent. evaporative efficiency with a marked decrease in the quantity of smoke emitted.

When electric power is used underground, due precaution should be taken that the insulation of the winding and current-carrying parts is of a character to resist the continued action of a moist atmosphere. The insulating material used for high-tension work is generally better suited to stand this action than that commonly used on low or medium pressures.

and it is therefore especially important in cases where medium pressure is employed to pay particular attention to the class and method of insulation, and to avoid the use in it of any material of a hygroscopic nature. The accumulation of coal dust on the windings should be avoided as much as possible, as it might form a conducting film, or layer, over the insulation to the frames. Periodical inspection and cleaning should be enforced as a preventative. Motors should be placed in well-built chambers, properly lighted and ventilated with intake air.

Recent tests show that an ordinary miner's lamp (of the type generally worn on the miner's cap) when burning tallow, consumes 2.49 cu.ft. of oxygen and produces 1.74 cu.ft. of carbonic acid per hour. The same lamp when burning oil consumes 1.13 cu.ft. of oxygen and produces 0.78 cu.ft. of carbonic acid per hour. The same investigators determined the candlepower of various lamps by photometry as follows: Wolf safety lamp (having a wider flame than most safety lamps and a white enameled reflector), burning with a flame 9 in. high gave 8 candlepower. Scottish miners' oil lamp (consuming 13.8 grams of oil per hour) average during 15 min. with uniform flame, 1 candlepower. The kind of oil used affects the candlepower considerably. Scottish miners' tallow lamp (consuming 17.4 grams tallow per hour) average during 15 min. with uniform flame, 2.3 candlepower. Scottish miners' lamp (consuming 13 grams paraffin wax per hour) gave 1.6 candlepower. Scottish miners' lamp (consuming 19.3 grams paraffin wax per hour) gave 2.6 candlepower.

The English coal mine laws forbid the use of electric motors, that are liable to sparking, in gaseous workings. In an attempt to solve this problem, competent engineers have recently made a series of experiments to determine the proper method of encasing such motors. It was found that practically all of the protective devices proposed were a positive danger in an explosive atmosphere. Inclosings made of wire gauze or solid covers were found to be inefficient. The covering of the openings with wire gauze (even with two layers) was not found altogether satisfactory. It was discovered that if gaps were provided of a certain size, that is, not too small to prevent the egress of the heated gases and cause a dangerous rise of pressure, and not so large as to allow free passage of the burning gases, the communication of the explosion was avoided. In some cases the failure of the gauze may have been due to the too coarse mesh, but generally it was found that the gauze did not offer sufficient cooling surface to prevent the inclosed gases from being raised to a dangerous temperature, and finally allowing the explosion to be communicated to the external atmosphere

THE ENGINEERING AND MINING JOURNAL

Issued Weekly by the

Hill Publishing Company

JOHN A. HILL, Prop. and Treas. ROBERT MCKEAN, Sec'y.
505 Pearl St., N. Y. C.
London Office: 6 Bonville Street, London, E. C. Eng.
Cable Address "ENGINEERING, N. Y."

Subscription, payable in advance, \$5.00 a year of 52 numbers, including postage in the United States, Mexico, Cuba, Porto Rico, Hawaii or the Philippines. \$6.50 in Canada.

To foreign Countries, including postage, \$8.00 or its equivalent, 33 shillings; 33 marks; or 40 francs. Notice to discontinue should be written to the New York office in every instance.

Advertising copy should reach New York office by Thursday, a week before date of issue.

For sale by all newsdealers generally.

Entered at New York Post Office as mail matter of the second class.

CIRCULATION STATEMENT

During 1908 we printed and circulated 507,500 copies of THE ENGINEERING AND MINING JOURNAL.

Our circulation for April, 1909, was 43,000 copies.

May 1, 1909, 12,000

None sent free regularly, no back numbers. Figures are live, not circulation.

Production of Copper in 1908

We have received official reports for the full calendar year 1908 from all of the producers in North America. These show that the production of copper in the United States in 1908 was 948,196,490 lb., against 879,241,766 lb. in 1907. In each year the statistics are computed on the uniform basis of production of the Michigan mines, plus the fine copper content of the blister copper produced by the other smelteries, plus the copper content of ore and matte exported, the last being a comparatively insignificant item. As we have previously pointed out, this method of computation differs from that based on the output reported by the refineries, and is adopted as representative of the production of the country because it comes nearest to the output of the mines. Details of the statistics are given in the accompanying tables.

PRODUCTION OF COPPER IN THE UNITED STATES

Groups.	1907.	1908.

Totals	1,055,367,300	1,100,092,010

The production of copper in Canada and Mexico is computed on the same basis as in the case of the United States. Our statistics differ somewhat from those of the Canadian government, because the latter reckons the copper content of ore, matte and blister copper, while we do not enumerate it until it has all been converted into blister copper, which to a large extent is done after the crude material has been exported from Canada. The basis of blister copper is the only one that precludes danger of duplication. In the cases of Mexico and Cuba there are no official statistics.

Many of the producers of blister copper resmet a good deal of scrap copper. This has been carefully excluded in our statistics. It is to be remarked that all of the copper that we report as the production of the smelters, and consequently of the mines, does not finally appear as refined metal, several million pounds per annum being recovered by the refiners in the form of bluestone. The production of the latter as a by-product in the United States was 37,654,961 lb. in 1908, compared to 34,867,650 lb. in 1907. A small portion was obtained each year as a direct product in the treatment of matte, but the bulk of this production is made as a by-product by the electrolytic refiners. The copper content of bluestone is roughly 25 per cent.

(c) Estimated.

The statistics of the world's production of copper ore are based on our own figures for North America, together with those of Henry R. Merton & Co., and the respective governments for other countries, the official figures being used when they are available and of undoubted accuracy.

The Virginian Railway

The opening of a new railroad into a district of established traffic has always a disturbing effect, even though the new line may develop some traffic especially its own. This has been the case with the Virginian railway, to which reference has already been made in these columns. The expected effect has been increased by reports regarding the intentions of the owners of the new line. It is stated, without contradiction and apparently from well informed sources, that the company intends to enter largely into the seaboard trade, especially in New England territory. To this end it will establish at central points on the coast large storage plants from which coal can be furnished directly to consumers; and in connection with these it will maintain steamship lines which will deliver coal to the different distributing ports. At the present time the seaboard trade is carried on mainly by sailing vessels and barges; steam colliers will be able to make quick and regular trips and to maintain stocks at the distributing yards, no matter what the conditions of wind and weather may be. How far this plan is to be carried out is uncertain, but there seems to be little doubt that something of the kind is in contemplation.

One effect will be to change to an important degree conditions in the seaboard trade. At present sales are made at prices—whatever they may be—delivered at shipping points, the purchaser paying the coastwise freight rate. Under the new plan prices will be fixed at the port of delivery, throwing the freight rate upon the selling company and making the price to the consumer of rather a speculative character to those companies which do not own their own vessels. The reports have already caused a commotion in the seaboard bituminous-coal trade and there is a degree of uncertainty which has prevented many large consumers from closing their contracts for the season.

Possibly all the current rumors are not correct. It is evident, nevertheless, that the Virginian railway intends to have a hand, and an important one, in the large trade for which it was built to serve. A fuller exposition of its plans is anxiously awaited by some of its rivals.

Current report also has it that negotiations are in progress for a combination with the Chesapeake & Ohio railroad for

a Western connection, the object being to secure a share of the Western trade, which is already much disturbed at the competition of West Virginia coal.

The Anthracite Situation

Although the anthracite operators and miners have been gradually approaching an agreement, it cannot be said that the situation is yet definitely settled. As we anticipated, the very strong position of the companies has gradually forced the miners into a practical acceptance of the companies' proposition for the renewal of the present agreement for a three-years' term. A few concessions of minor importance were made by the operators' committee, apparently more for the sake of appearances than for anything else. The final proposition is being considered by a miners' convention which is now in session. It is within the possibilities, however, that some trouble may arise to prevent the settlement and it is not safe to say that a strike is finally averted; nor will it be safe to say so until the agreement is finally made and signed by both parties. Those who can recall the situation 16 or 17 years ago will remember that the worst strike on record in the anthracite country followed the actual closing and signing of a preliminary agreement.

State Regulation of Mining in Norway

As is well known, the Norwegian government has been taking an advanced position with respect to the conservation of the resources of that country, and particularly the protection of domestic interests. This has to a large extent prevented the preemption of the great water powers by corporations. Indeed, it is considered to have retarded development to some extent.

A concession recently granted for the working of the Glomrindkollen zinc mines is illustrative of the present policy of this government. The concession is for 82 years, at the end of which period the mines revert to the state. Their operation must be carried on according to the laws governing the proper working of mines. The company must submit a working plan to the Department of Mines, which has the right of altering it, but the company may appeal for a final decision to a commission of arbitration. The company, under a

penalty of 10,000 kroner, binds itself not to join any combination calculated to raise prices in Norway. Only Norwegian workmen and officials may be employed, and Norwegian material must be used if as good and not exceeding in cost by 10 per cent. that supplied from abroad. If a company store be opened the net profits accruing therefrom must be devoted to the benefit of the workmen.

IT IS INTERESTING to note that the litigation between the American and British stockholders of the Harney Peak Tin Mining, Milling and Manufacturing Company, which has been before the courts for 14 years, has been ended and a reorganization is in process of being effected. During all these years Dr. A. R. Ledoux has been receiver for the company, but has been prohibited by the courts from spending any money in development of the mines. We understand that under the terms of the reorganization the first thing to be done is to make a careful test of the most promising properties to determine what is the grade of any ore found in quantity, and to inaugurate this work Doctor Ledoux has already gone to the Black Hills. It is gratifying to know that through this settlement there is at last a possibility of establishing a tin industry in South Dakota.

AN IMPORTANT INCIDENT in its bearing upon coal traffic is the purchase by the Pennsylvania Railroad Company of the stock in the Norfolk & Western Railway Company which it sold three years ago. This large block of stock will give the Pennsylvania a controlling voice in Norfolk & Western affairs. Two considerations have doubtless prompted this purchase, one being the opening of the Virginian railway; the other is the manifest intention of the independent operators in the Pocahontas district to compete actively for coal business on the seaboard with the Clearfield, Cambria and Pittsburg regions. This can be done only by securing extremely low rates from the railroad, to meet which would involve a considerable sacrifice of revenue by all the other lines concerned.

This transaction and some other recent movements have given rise to rumors of a contemplated "soft-coal trust." To these revivals of an old story, little credence is to be given. The bituminous trade is too large for one combination to handle.

Mineral Riches of the German Colonies

By ROBERT GRIMSHAW*

As the Germans are beginning to understand that they cannot compel the negroes in Africa to become farmers, also that their own people who have no capital cannot settle there and get rich, they are turning their attention to discovering minerals which they can export to Germany and other countries. In this they are succeeding admirably. The following is a résumé of a report recently published by the Imperial Colonial Department.

Hard coal, which has already been tested, and concerning which the reports as to its value are favorable, has been discovered in southwest Africa near Keetmanshoop; also in East Africa on Lake Nyassa, and in the German possessions in the Indian ocean. Iron ore is found in Togo, southwest Africa, and Kaiser Wilhelm Land. Signs of gold have been noted in both Southwest and East Africa; in the latter, recently on Kironda creek, where it is to be worked by a company already formed. Blue dirt, the soil in which diamonds are found, has been met with in several places in Southwest Africa; and in the same places a variety of other precious and semiprecious stones. Mica of excellent quality is found in Kamerun, in the district of Ostdinge.

Phosphate beds are among the discoveries in the Bismarck archipelago, and this material has been shipped therefrom. The first shipments have been received in Germany, the amount being stated as 3911 metric tons between Jan. 1 and June 30, 1908. There is marble in Southwest Africa in the neighborhood of the railway station Kubas.

As there are in the German colonies and protectorates immense areas awaiting prospectors, as for instance, in German East Africa, and on Lake Tanganyika, as well as in the Kilimandjaro district; and as farther in the back country (Hinterland) of Kamerun, there are large districts which have not been geologically surveyed, the Colonial Committee charged with such work intends to have these regions properly surveyed by geologists and prospectors, in order to afford the population new sources of income.

The most important copper deposits are in the Oktavi district. There are in this region several mines, of which the Tsumeb is the most important. The ore of this mine has been shown to be very rich in copper, so that the company exploiting it has changed its original idea of working it in Africa, and intends sending the best grades to Europe for smelting. According to the opinion of experts, officially published by the government the yield of this mine should be about 35,000 tons of ore per year.

River-bed Mining in California

SPECIAL CORRESPONDENCE

More attention is being paid these days than for some time past to river mining in California. Steam shovels and engines take the place of the old wing-dam and Chinese pump in these operations, though those old appliances are still in use along the Klamath river at certain localities. Up on the Stanislaus river, which divides Calaveras from Tuolumne county and San Joaquin from Stanislaus county, several companies recently formed have taken up much of the river bottom, especially between Parrot's Ferry and Camp 9 of the Standard Electric Power Company. Hereabout the primitive style of river-bed mining will be modernized. Steam shovels are to be used to lift the auriferous gravel from the river bed. At Otter Bar similar enterprises are under way; and at the confluence of the Middle and North forks of the river, operations of the same nature are projected. Up to this time only intermittent operations have been carried on when there was a low stage of water in the stream.

A New Grondal Plant in Sweden

By N. V. HANSELL*

One of the most recently erected Grondal plants in Sweden is the one connected with the Lulea Iron Works in northern Sweden. The ore used there is taken from the well known Gellivara mines and contains 58 per cent. iron, 0.10 per cent. sulphur and 1.3 per cent. phosphorus. Although this ore is high in iron, on account of its high phosphorus content, it was found to advantage to fine grind it, separate it wet, and afterward briquet the concentrates. The latter generally contain 72 per cent. iron, with 0.017 per cent. sulphur and 0.008 per cent. phosphorus. The tailings have a total iron content of 8.4 per cent., composed of about 1.5 per cent. magnetite and the balance in silicates and hematite. They contain 5.7 per cent. phosphorus. The quantities of concentrates and tailings stand in the ratio of 78 to 22, making the total recovery of iron 97 per cent. The briquets usually average about 70 per cent. iron.

In the Swedish iron industry briquets have been extensively used in the blast furnaces. From an ore containing as much phosphorus as the Gellivara briquets are produced with only 0.008 per cent. phosphorus and 0.006 per cent. sulphur. The iron obtained is high grade, with guaranteed 0.01 per cent. sulphur and 0.02 per cent. phosphorus. In the blast-furnace charge briquets alone are used, making

the iron percentage of the charge between 65 and 70. The charcoal consumption per ton of pig iron is said to be lower than in the usual Swedish practice, on account of the physical character of the briquets.

Steel and Iron in France

The production of pig iron in France is reported by the Comité des Forges as below, in metric tons:

	1907.	1908.	Changes.
Foundry iron.....	651,700	705,527	I. 53,827
Forge iron.....	673,885	543,967	D. 129,918
Bessemer pig.....	122,046	118,121	D. 3,925
Basic pig.....	1,988,343	1,949,107	D. 39,236
Special irons.....	152,975	74,428	D. 78,547
Total.....	3,588,949	3,391,150	D. 197,799

Foundry iron includes 111,101 tons direct castings in 1908. Special irons included ferromanganese and similar alloys. The raw material used in 1908 included 7,357,686 tons domestic iron ore, 1,568,114 tons imported iron ore, 144,339 tons manganese ore and 649,652 tons of scrap, cinder, slag and pyrites residue.

The steel production is reported as follows, in metric tons:

	1907.	1908.	Changes.
Acid converter.....	78,771	77,581	D. 1,090
Basic converter.....	1,669,757	1,632,296	D. 37,461
Open-hearth.....	1,001,463	1,002,789	I. 1,326
Crucible.....	16,782	12,662	D. 4,120
Electric.....		2,289	I. 2,289
Total.....	2,766,773	2,727,617	D. 39,156

Electric steel was reported separately in 1908 for the first time. The figures above are for ingots. Finished steel reported was 1,860,308 tons in 1907, and 1,894,022 in 1909; an increase of 33,714 tons. The larger items of finished steel in 1908 were 390,037 tons merchant steel, 344,772 tons plates and sheets, 333,756 tons angles, shapes, etc., and 322,241 tons rails.

The National Bureau of Standards in the Department of Commerce and Labor has contracted with Constructor Emery, who built the large testing machine at the Watertown arsenal, to furnish a new testing machine, to cost \$150,000, for the use of the Bureau of Standards. This machine will be installed for the purpose of making tests for the public and for the other departments of the Government, the work of the Bureau of Ordnance in the War Department being now limited to the testing of materials for guns and gun carriages.

The first electrometallurgical plant for making tool steel in Russia has just been installed at the Oboukhoff works, near St. Petersburg. Professor Lipine, after visiting most of the plants of this nature in other countries, decided that the Heroult system was the best adapted for the purpose, and the present equipment is of that type.

*Engineer, Dresden A. Germany.

The Hand Jig in Practice

By C. N. NELSON*

Under my direction at Santa Barbara, Chihuahua, we had occasion to use over 30 hand jigs and the following data and sketch are from notes taken over a period of 10 months. The ores of the district are mainly oxidized lead and silver minerals with occasionally gold and copper; and it is on these soft, easily sliming ores that the hand jigs prove their usefulness. With sulphides, of course, good results are easily obtained.

As may be seen from the sketch, the screen moves in the water and the hutch product, called *lamas* or slimes, is retained with the water in the hutch. When the latter fills up with slimes nearly to the top the screen is removed and the hutch emptied by shoveling. The concentrates are obtained from the screen by the use of a tin scraper, first cleaning off the layer of tailings and then the concentrates. Five-gallon oil cans are used to remove the products. This sounds like a tedious and costly operation but as one man can produce about one-half a ton of concentrates and slimes per day of nine hours, it is not very costly with Mexican labor.

The jigs are made in batteries of two and three for economy of lumber and space. A good arrangement is to have two rows of jigs with a track for the tailings car down the center, and room for ready access of wheelbarrows to all the jigs.

The heads should be carefully screened, and two or three sizes maintained as closely as possible. The mesh of the jig screens is, of course, varied according to the size of the heads and proportion of slimes desired. A $\frac{3}{4}$ -in. aperture iron wire screen was used for the coarser material, and $\frac{1}{2}$ -in. aperture for the finer. For more careful work still finer screens may be used.

The jig patio is generally let out on contract to one man who contracts to deliver the concentrates and slimes on the patio above a given minimum assay value. The contractor furnishes all labor necessary but has the ore delivered to the screen at the head of the patio. The prices were about \$2 per ton for the coarse and \$1.50 for slimes, with labor at 75c. per day of nine hours. These prices varied with the grade of the heads and the convenience of operation.

The water was furnished from a tank about 8x5x6 feet, which supplied 20 jigs and took its small supply from the mine. The water is needed chiefly in refilling the hutchers after a clean-up, though a little is used all the time to make up for the splash.

*Mining engineer, 120 North Norwood avenue, Buffalo, N. Y.

The heads are wheeled up to the jig and piled in front and the screen filled by shovel when required. The concentrates are not removed every time the tailings are cleaned off, but allowed to accumulate a little. The motion of the screen is given by a quick down stroke on the long arm with a slower recovery. The spring of the arm and looseness of the suspension give an even motion with the required variation in the up-and-down movements. This action has to be learned by the operator; the men also get very skilful in judging the amount of work needed to clean a screen full of ore, and the depth to scrape to keep the tailings clean.

The assays given in the accompanying table were averaged from about three months' operation on 3000 tons of ore. The value is given in United States currency on the basis of silver at 60c. per

The Kent Coalfield in England

SPECIAL CORRESPONDENCE

Kent Collieries, Ltd., is a company formed in 1905 to work the coal which had been proved to exist under the well known Shakespeare's cliff at Dover, England. For one reason or another the company has so far succeeded in doing little more than proving the existence of the coal as a workable deposit, and is now seeking for fresh capital. Two shafts have been sunk, known as No. 2 and No. 3. No. 2, which has an inside diameter of rather more than 14 ft., has been sunk to a depth of 1632 ft. and has penetrated several seams of coal. This shaft is lined with iron casing and concrete backing to a depth of 1200 ft. below which it is lined with brick and cement. No. 3 shaft,

HAND JIG PATIO AT SANTA BARBARA, CHIHUAHUA

oz., copper at 18c. per lb., lead at 4c. per lb., the metric ton being used.

HAND JIG OPERATIONS.

	OZ. PER TON		PER CENT.		Value Per Ton.
	Au.	Ag.	Pb.	Cu.	
Ore.....	.12	8.0	11.6	...	\$18.41
Concentrates.....	.17	24.5	34.0	2.0	55.94
Slimes.....	.42	12.0	29.0	0.6	49.52
Tailings.....	.06	3.0	2.5	...	5.20

The use of hand jigs is peculiarly appropriate to small mines in a region where water is scarce and ores soft and easily slimed, and where a shipping product must be made with moderate initial outlay. In theory the jig is rather interesting, as it may be said to combine the action of the jig with that of the old Cornish dolly-tub.

The domestic production of metallic sodium in 1908, according to statistics collected by the ENGINEERING AND MINING JOURNAL, was 2000 short tons valued at \$1,000,000.

which will be the main hoisting shaft, has an inside diameter of 18 ft. and is down 674 ft., the bottom being some distance yet above the coal. In No. 2 shaft several seams of coal have been cut, while others have been proved to exist by boreholes. Coal was raised from a seam at 1274 ft. and 200 tons were sold to the railway company, which traverses the coalfield, for testing purposes, the results of the trials being reported satisfactory. The thickness of the seam at 1274 ft. was 20 in. A larger seam, 4 ft. in thickness, was met with in a borehole at a depth of 2221 ft. and it is intended to sink the shafts to this depth, when further funds are subscribed.

The coalfield has been reported on by a large number of experts, including Professor Hull, a member of the Royal Coal Commission 1901 and a director of the company. Professor Hull states that no fewer than 13 seams of coal of various thicknesses were proved by boring, of which seven might be considered workable. The lowest was the 4-ft. seam mentioned above. The bottom of the coal formation

has not yet been met with, so that further coal seams may still be found to exist. Another expert who has reported favorably on the undertaking is Carl Hold, a German mining engineer from Westphalia.

The possibilities of the coalfield have recently attracted the attention of prominent coal owners of the South Wales coalfield and their coöperation has been promised, provided the shareholders will find the money required for the further sinking of the shafts and for equipping the colliery with a suitable plant for mining the coal and making it marketable. These practical gentlemen from South Wales are not prepared to take up the scheme unless they first have all the money which their long experience in coal mining tells them will be required, the amount being about £125,000. If the colliery is properly equipped these gentlemen, one of whom is chairman and the other the managing director of the well known Powell-Duffryn Steam Coal Company, of South Wales, say that they believe that Kent coal can be won profitably.

The geographical position of the colliery is favorable. Situated on the seacoast close to Dover, the coal would find a ready market for railway, industrial and shipping purposes. According to the South Wales experts, however, too much weight ought not to be placed on the geographical situation, because Newcastle coal could be delivered at the wharves in the Thames for 11s. 6d. per ton and if suitable arrangements existed at Dover harbor, coal could no doubt be delivered there at a price to compete with Kent coal. The businesslike way in which the undertaking was discussed by the South Wales coal experts at a recent meeting of the shareholders inspired confidence and it seems probable that the requisite amount of capital will be found. If so, it will probably not be long before coal mining in Kent, the garden of England, will become an accomplished fact.

are shown in the following table are obtained. Gross tons are used throughout:

Scrap, etc.	1880.	1890.	1900.	1904.
Blast furnaces . . .	316,114	1,145,699	1,600,313	1,865,385
Rolling mills and steel w'ks.	1,198,842	1,726,162	4,113,287	5,124,277
Total . . .	1,614,956	2,871,761	6,713,600	6,989,662

The great increase shown in the table in the use of scrap by rolling mills and steel works from 1890 to 1900 and from 1900 to 1904 is explained by the development of the basic open-hearth steel process, which actively began late in the 90's

cluded, and due allowance were made for the great increase in consumption by our basic open-hearth steel furnaces, it would probably be found that the total consumption of iron and steel scrap, cinder, scale, etc., in this country in the calendar year 1907 would amount to at least 12,000,000 tons, and might reach 12,500,000 tons, or almost one-half of our total production of pig iron in that year. The scrap and cinder consumption of 1908 was naturally much less than that of 1907. There was doubtless a large accumulation of scrap in 1908. . . . We are informed that there is an increasing tendency to substitute scrap for pig iron in the open-hearth furnace.

The Engineering & Mining Journal, N. Y.

DETAILS OF HAND JIG AT SANTA BARBARA

The Consumption of Scrap*

In addition to the millions of tons of iron ore which are annually consumed in this country in the manufacture of pig iron there is an ever-increasing consumption by our blast furnaces of mill cinder, scale, scrap, etc. While the consumption of materials of this character is not annually ascertained by the American Iron and Steel Association, it has been ascertained by the Bureau of the Census for the census years 1880, 1890, and 1900; also for the calendar year 1904. The Bureau has also ascertained for the same years the consumption of old rails and all kinds of iron and steel scrap by our rolling mills and steel works. By combining these two

statements the interesting results which

*From the *Bulletin* of the American Iron and Steel Association.

and which has since made wonderful progress. The acid open-hearth process is also a large scrap consumer. While no accurate figures are available it is probable that in 1904 the open-hearth process alone consumed approximately 3,000,000 tons of iron and steel scrap, and that in 1907, when the production of basic open-hearth steel was more than double that of 1904, the consumption of scrap in the open-hearth process approximated 6,000,000 tons.

In the above table the iron and steel scrap consumed by iron foundries, cast-iron pipe works, car-wheel plants, forges which manufacture scrap bars, etc., is not considered. If the scrap consumed by establishments of this character were in-

The Minister of Labor in Belgium has proposed a plan for the pensioning of old miners. Funds are to be raised by taxing employers 15 fr. per year for each miner engaged, and a similar amount is to be deducted from the wages of each mine worker. These receipts, enlarged by grants from the government, are expected to permit the payment of at least 360 fr. per year to every miner who reaches the age of 60 years.

According to the *Queens. Gov. Min. Journ.*, both stream and lode tin are reported as being discovered in the Northern Territory of South Australia, the locality on this occasion being a few miles east of Eureka mines of Pine creek.

Zinc Mining in Butte

By A. H. WETHEY*

Butte has been known for so long a time as one of the greatest sources of supply of copper in the world, that it has not received much recognition heretofore as a probable center from which large quantities of zinc may be furnished. It is true that considerable quantities of zinc ore have been found from time to time in various of the producing copper mines of Butte, but such ores have been more valuable for copper and silver than for the zinc they contained, and no effort has been made to recover the zinc.

Extensive development work during the last two years in the eastern end of the Rainbow lode has resulted in the discovery of immense deposits of zinc ore, containing from 10 to 50 per cent. zinc. In order to render the ores of sufficiently high grade for the zinc smelters, the Butte Reduction Works has recently installed a concentration plant for that purpose. The concentration of zinc ores differs from that of the copper ores in the Butte camp. With the copper ores every effort is made to save as much of the copper as possible with a minimum amount of crushing. It is only after all the coarse mineral has been saved that fine crushing is resorted to in order to save the copper in the slimes. With the zinc ores it is found necessary to crush the ore much finer than is the practice with the copper ores. The concentrates from the ores developed in the Elm Orlu mine owned by the Elm Orlu Mining Company, and the Black Rock mine owned by the Butte & Superior Copper Company, readily concentrate up to above 40 per cent. zinc, and will carry in addition from 3 to 4 per cent. copper, from 20 to 30 oz. silver and from \$1 to \$2 in gold. The zinc smelters after distilling off the zinc sell the residue to lead and copper smelters, for whom it is an excellent material, it being practically free from sulphur, while most of the zinc is eliminated in the distillation process.

The concentration plant at the Butte Reduction Works will have a capacity of about 300 tons per day. It requires about 2 to 2½ tons of the zinc ore to make 1 ton of zinc concentrates. It is estimated that in the two properties already referred to, there are approximately 400,000 tons of zinc ore already developed. It seems singularly appropriate that Ex-Senator W. A. Clark, who has been interested in the Butte district for over 30 years and was one of the pioneers in the development of its mines, and also in the erection of plants for the treatment of the Butte ores, first for the treatment of silver ores and then for the treatment of copper ores, should now be among the pioneers in the erection of a plant for the wet concentration of

zinc ores. The Elm Orlu property is owned by Ex-Senator Clark and his son, W. A. Clark, Jr., while the Butte Reduction Works is owned by Ex-Senator Clark, and is the oldest smelting and concentrating plant in this district, having been in continuous operation since 1885.

A New Direct Method for Determining Nickel in Steel

By H. GROSSMANN AND WALTHER HEILBORN*

When separating nickel from tri-valent iron by the method already described in the JOURNAL, p. 1044, 1908, the precipitation of ferric hydroxide by caustic alkali or ammonia must be prevented. This is most easily effected by the addition of some soluble tartrate. The amount of tartrate to be added varies, according to the relative amounts of nickel and iron, and in the analysis of nickel a great deal more of the tartrate has to be added than in the analysis of alloys containing, approximately, equal amounts of the two metals. If to a solution of nickel steel only a little more tartrate is added than necessary to prevent the precipitation of the two hydroxides and then the precipitation of the nickel by the new method effected, the color of the solution above the precipitate remains red and the liquor contains most of the ferric iron in the colloidal state, for the complex ferric alkali-tartrate primarily formed is largely hydrolyzed. This is corroborated by polarimetric methods, not to be described here. The colloidal solution produced by the hydrolysis not only retains considerable amounts of the nickel-dicyandiamine, but may also coagulate spontaneously and completely spoil the analysis. If, however, a large excess of tartrate is added the hydrolysis is largely diminished and the alkaline solutions of a yellowish or greenish color will keep unchanged many days and will always yield good results.

SCHEME OF ANALYSIS

In consideration of the above the practical execution for the determination of nickel in steel is as follows: Dissolve 0.5 to 2 grams steel, according to the percentage in nickel, in aqua regia, evaporate on the water bath to a volume of about 10 c.c., filter off any impurities and the silica precipitated and add to the solution about 15 grams of sodium-potassium tartrate for each gram of steel. In the presence of much manganese oxidation must be prevented by the addition of some hydrazine sulphate. In case, after addition of the tartrate, a crystalline precipitate of yellow color is formed (it consists of potassium bitartrate colored by

inclosed mother liquor), a little ammonia is added and the precipitate redissolved. To the solution giving off a strong odor of ammonia an excess of caustic soda is added. In most cases about 40 c.c. of a 20-per cent. solution seems to be sufficient. In case, however, no precipitate is formed after a little while, some more caustic soda is added. The nickel dicyandiamine naturally is formed more quickly with a high percentage of nickel in the steel and with a small amount of solution. In the analysis of alloys rich in nickel the filtration may be effected as soon as the liquor above the precipitate has cleared up completely, while solutions containing but little nickel are left to stand for quite a while before filtering.

The suitability of the described method is shown by the accompanying analyses applied to six different grades of nickel steel from Krupp. The percentages given in the last column are those found at the Krupp works by the potassium cyanide method.

ANALYSES OF DIFFERENT GRADES OF NICKEL STEEL.

Batopilas Mining Company

The report of the Batopilas Mining Company, April 12, 1909, for the year ending Dec. 31, 1908, states that the work for the year was confined to the Porfirio Diaz Tunnel, Todos Santos, San Miguel, Camuehin, Animas and Exploration mines. The development work consisted of 21,343 ft. of drifts, shafts and raises. The ore handled during the year was, first-class, 944 tons, second-class, 99 tons, and third-class, 31,731 tons, or a total of 32,776 tons. The 100-stamp mill operated 258 days, crushing 31,732 tons of ore. The average net recovery from the third-class ore was 0.3 ounces silver per ton, producing 19.15 tons of first-class concentrate, containing 96,821 ounces. There were also 013 tons of second class concentrates containing 103,263 ounces or a total of 200,085 ounces. The company's surplus, which has accumulated during the years 1905 to 1908 is \$715,085.

According to E. F. Pittmann, under-secretary for mines, the mineral production of New South Wales for 1908 was £8,600,007, a decrease of £1,067,771, as compared with that of 1907.

*General manager for W. A. Clark's mining interests, Butte, Mont.

*Fitzburgerstr. 8, Berlin W. 15, Germany.

Personals

Mining and metallurgical engineers are invited to keep *THE ENGINEERING AND MINING JOURNAL* informed of their movements and appointments.

Cortlandt E. Palmer has returned to New York from Mexico.

B. B. Thayer has gone to Butte, Mont., on a periodical tour of inspection.

C. Colcock Jones is examining mining property in the vicinity of Goldfield, Nevada.

R. Meeks is at Webster, N. C., superintending the erection of machinery at the nickel mine there.

Huntingdon Adams is now manager of the *Compañía Minera de Navidad y Anexas, S. A.*, of Oaxaca, Mexico.

Camille Clere passed through New York last week on his return to Paris after a year spent in Colombia and Ecuador.

H. F. E. Gamm has returned to Rutherford, N. J., from a professional trip to Blacksburg, S. C., to visit some manganese and tin properties.

H. W. Hardinge is returning to New York, having made an extensive trip through Colorado and Arizona in the interest of the conical mill.

Norval J. Welsh has completed a two months' examination trip in Coahuila and Chihuahua, Mexico, and is at the Engineers' Club, New York, for an indefinite stay.

Percy E. Barbour has accepted the management of the Promontorio mines at Minas Nuevas, Sonora, Mexico, recently acquired by the Clark Copper Company, of Los Angeles, California.

James MacNaughton, general manager of the Calumet & Hecla, has returned to the mine after an extended visit South, where he went to recover his health, having been ill with appendicitis.

R. M. Raymond has been appointed managing director of El Oro Mining and Railway Company, and will have his headquarters in the city of Mexico. Alfred F. Main succeeds Mr. Raymond as general manager at El Oro.

George Gordon Crawford, of Birmingham, Ala., president of the Tennessee Coal, Iron and Railroad Company, who has been abroad for the past three months for his health, after an attack of typhoid fever, is expected in New York, April 28, and in Birmingham a few days later.

Edward Flynn, former president, of Alabama district No. 20, United Mine Workers of America, has been appointed chief State mine inspector of Alabama for a three-year term, commencing May 1. Mr. Flynn served out the unexpired term of J. M. Gray, who took a position with a Walker county coal company.

F. G. Coggin, superintendent of the

Champion and Baltic stamp mills of the Copper Range Consolidated Company, and also the Atlantic stamp mill, has resigned from the Copper Range mills, to take effect May 1. He will be succeeded by Edward Keopel, superintendent of the Trimountain mill, who will then become head of all three of the Range mills. Mr. Coggin will for the present remain as head of the Atlantic mill.

Obituary

Job Froggett died in Youngstown, O., April 18, aged 80 years. For over 40 years he had been prominent as a blast furnace manager in the Mahoning Valley district. He retired from active work 10 years ago.

William M. Stewart died in Washington, April 23, aged 82 years. He was born in Lyons, N. Y., in 1827, but passed most of his boyhood in Ohio. He entered Yale College, but left there to join the rush to California in 1849. After mining for some years he studied law and was admitted to the bar. About 1860 he went to Nevada and soon became prominent in the then new territory as an owner on the Comstock, and in politics. In 1863 he was chosen one of the United States Senators from the new State, and was in the Senate until 1875, when he returned to Nevada and engaged in mining. In 1887 he was again elected to the Senate and served three continuous terms, until 1905. During that period he became prominent as a leader of the advocates of silver coinage, and was the most widely known of the group of "silver senators." After his retirement from Congress he lived chiefly in Washington, though he frequently visited Nevada, where he had extensive interests in the newer mining developments of the State. Senator Stewart made and lost several fortunes in the course of his career, but is believed to have been possessed of valuable property at the time of his death.

Societies and Technical Schools

Morenci Mining Society—A society has been organized at Morenci, Arizona, for the purpose of visiting the mines of the district and studying their geological features and methods of working.

Canadian Mining Institute—A meeting of the Cobalt Branch was held in Cobalt, Ont., April 21, at which R. W. Brigstock was elected chairman, A. A. Cole secretary-treasurer for the ensuing year, and E. L. Fraleck, Robt. Bryce, S. L. Logan, M. T. Culbert and H. P. Davis as executive committee. E. L. Fraleck read a paper on mining conditions in Ontario; Neil McDonald spoke on Larder Lake, and A. A. Cole on sampling at La Rose

vein. President W. G. Miller, of the Institute, made an address, congratulating members on the success of the branch.

Missouri School of Mines—The Senior class accompanied by Professor Durward Copeland and Instructors Boyd Dudley, Jr., and H. T. Mann, has been visiting metallurgical plants in St. Louis and vicinity. At the Laclede-Christy plant the manufacture of refractory materials used in furnaces was studied. At the plant of the St. Louis Blast Furnace Company the class saw the production of pig iron and at the Scullin & Gallagher plant the open-hearth method of steel manufacture. The metallurgy of zinc was investigated at the Edgar zinc works and the metallurgy of lead at the Federal Lead plant at Federal, Ill., at the St. Joe Lead plant, at Herculaneum, and the National Lead Company's plant at St. Louis.

University of Wisconsin—This institution at Madison has arranged a new course in mining engineering, to cover four years. Ore dressing and assay laboratories are to be equipped in a special building. A course in practical assaying will follow those in general chemistry and quantitative analysis. The course in excavation and quarrying will include excavation, explosives, blasting and allied subjects. Tunneling, boring and shaft sinking will form the subject of another course in which the ventilation, drainage, and timbering of mine shafts will be considered, with the methods of sinking shafts. In the course on prospecting and mine development the relation of mining geology to exploration will precede a consideration of the various forms of prospecting on the surface and by shafts and drifts, and the development of veins discovered. A separate course in exploitation of mines will be given. Mine accidents, their causes, control and prevention will be treated in the general course.

American Society of Engineering Contractors—On April 14 and 15, meetings were held at the United Engineering Society building, in New York, at which a constitution was adopted and officers and directors were elected. The object of the society is the advancement of engineering knowledge and contracting practice; the maintenance of a high professional standard among its members and the elimination of those practices and abuses that now exist in the engineering and contracting business, and to strengthen the bond that should exist between engineers and contractors. Officers for the first year were elected as follows: George W. Jackson, Chicago, president; Halbert P. Gillette, New York, first vice-president; F. Baxter, New York, second vice-president; Daniel J. Bauer, New York, temporary secretary. The society will begin monthly meetings in the fall. It is already assured of a large membership. The temporary secretary has his office at 721 Park Row building, New York.

Special Correspondence from Mining Centers

News of the Industry Reported by Special Representatives at San Francisco, Butte, Denver, Goldfield, Salt Lake City, Toronto

REVIEWS OF IMPORTANT EVENTS

San Francisco

April 23—The dredge miners are having more troubles of their own because State Engineer Ellery comes out in the public press and says that the main contributing cause of the overflow of the Feather river at Biggs is the dredges. The great piles of rock which they have left behind them in their operations have, changed conditions so that the river is obstructed and the flow of water is naturally retarded in its movement toward the Sacramento river. He wants the dredges to carry on their operations according "to one system." He is compelled to confess that erosion is another cause of the floods but says that "this would not happen if the dredges were compelled to level out the heaps of cobbles and stones which they have piled up." He gives it as his opinion that dredge mining is a matter that must be controlled or otherwise the rivers will be ruined. Mr. Ellery intends sending an engineer from his office to make a complete detailed survey and prepare for overcoming the present bad conditions. A levee along the west side of the river is suggested and it is also thought that the river must be "straightened."

The "good roads" question in the mining districts of California is one attracting much more attention than ever before. In fact it has become recognized, that the more prosperous and active camps, or districts, are those which have good transportation facilities. At the present time a number of mining communities are trying to get better roads to places near railroad lines. Washington, 18 miles from Nevada City, is one of these. During the winter the mining companies at Washington had to keep the road open with their own teams. To develop the mineral resources of that portion of Nevada county there should be good transportation facilities and the Nevada County Promotion Committee has taken the matter in hand for the mining companies with the idea of getting the county itself to pay out more money for good roads.

Sierra county, an isolated mountain region without railroads, and at an elevation where there is much snow in winter, has a number of mines, but they still remain largely in an undeveloped condition owing to lack of good communications. It is believed that the prevailing conditions would be greatly bettered by the construction of a road from the vicinity of Good-year Bar, Sierra county, to Marysville, Yuba county, following generally the shortest practicable route along the North

Yuba river. The mining people of the county are engaged in an effort to make the county supervisors build it. A number of mining companies have offered \$1000 each toward the proposed road and other citizens of Forest, Alleghany, Downieville, Sierra City and other towns will contribute.

Many oil producers who have been vigorously denying that there was an overproduction of petroleum in California have met with a surprise when officials of the independent producers announce that an excess of 10,000 bbl. per day above consumption is now being made, and that by the end of the year this excess will be about 20,000 bbl. daily. A curtailment of production is advised until business conditions improve and the market can absorb a greater amount of oil. The Associated Oil Company has about 750,000 bbl. in storage in the Kern river field and the Standard Oil Company has 12,000,000 bbl. It is impossible to dispose of this oil at present prices. Meetings of those principally concerned will shortly be held and it has virtually been agreed that a suspension of development throughout the State will be recommended.

Meantime the oil companies listed on the Oil Exchange paid in dividends \$402,000 last month and this does not include some of the very big ones. But the Japanese have quit taking oil from Gaviota—the Santa Maria field—and none has been sent them this year. It was thought that the demand from that quarter would greatly increase but the contrary is proving to be the fact.

Butte

April 21—On February 19 a further hearing of testimony in the case of Fred Bliss vs. Anaconda Copper Mining Company, *et al.*, was had in the Federal district court before Judge Hunt. The mining company had some time previous offered testimony to the effect that everything possible was being done toward the elimination of the poisonous fumes from the smoke of the Washoe smelter. At the hearing held on the nineteenth, the complainant was to have an opportunity to give testimony showing by what means the company could further abate the smoke nuisance. The complainant failed to introduce any testimony on this point, but instead filed his written offer to arbitrate the question at issue. In his offer to arbitrate, the complainant states that he is willing either to submit the matter to a

board of arbitration or to have condemnation proceedings instituted in the ordinary manner for the purpose of allowing the smelting company to purchase his land. The complainant further insists that should the defendant mining company agree to arbitration, such arbitration should include the claims of all of the members of the Deer Lodge Valley Farmers Association, who are equally interested with complainant in the matters involved in the trial of the case. The decision of the court may not be made for some time to come.

In the action of E. W. Beattie, Jr., vs. Bald-Butte Mining Company, instituted in the Federal district court a short time ago, Judge Hunt recently appointed N. P. Walter and Cornelius Hedges, Jr., as receivers for the company. This allows one representative for each of the two contending factions in the company. The State Board of Railroad Commissioners has decided to reopen the hearing on coal rates recently terminated. The hearing will probably be some time before May 1.

In the case of the United States against the Northern Pacific Railway Company *et al.*, Judge Hunt, of the Federal district court, has entered a decree in favor of the Government in conformity with his decision rendered a week ago. By the decree the patent of the Northern Pacific to certain coal lands in Carbon county is declared to be null and void and the company is enjoined permanently from asserting any claim to the land. The case will doubtless be appealed to the circuit court of appeals.

Denver

April 23—In the Cripple Creek district, the apex and trespass controversy between the Jo Dandy Company and the New Haven Gold Mining Company, has been amicably adjusted, and the \$100,000 plant of the Jo Dandy (which was burned some months ago) will probably be rebuilt at once. The production of this mine prior to 1904 was large; the ore is found in a mineralized phonolite dike which traverses the property, and also in a fissure zone in the breccia. In the Eclipse No. 1 claim of the New Haven Company, the gold is in a system of parallel narrow seams which form the vein; it is also found in the breccia.

The deep drainage tunnel appears to be in difficulties, inasmuch as only \$388,500 of the \$500,000 required has been subscribed, and 70 per cent of the former

sum has already been spent. The tunnel company has asked the Colorado Springs Mining Stock Association for \$5000 to assist in the work, and will ask donations from all those mining companies in the district which have not already contributed. The original water level of the district was at about 9600 feet elevation, and was lowered first by the Standard tunnel, the portal of which was at 9027 feet, and next by the El Paso tunnel, at 8783 feet, the present one being at 8020 feet. It is generally considered as a great basin or collection of basins of underground water connected with one another, in the breccia area. Practically all the mines in this area will be unwatered by the completion of this deep drainage tunnel, and it is therefore felt that all mines in the district should contribute toward its construction.

It was shown at the annual stockholders' meeting that the Eagle Ore Company in 1908 sampled 193,000 tons of ore. A theft of concentrates is reported from the Golden Cycle mill, and it is stated that the manager has secured the return of \$5000 in cash and other valuables forming part of the proceeds of the robbery.

In the Red Mountain district, on the divide between Ouray and Silverton, the San Antonio company, owning the Carbon Lake mine, is the only one doing any extensive work at this writing. This bids fair to prove one of the largest copper producers in the State, and the manager is only awaiting the opening of the Silverton railroad to send down 50 cars of ore which he has stacked up at the mine. From July 1, 1908, to Feb. 1, 1909, 178 cars of about 23.5 tons each were shipped to the Durango smelter, the average yield of the ore being 11 per cent. copper, 8 per cent. lead, 0.12 oz. gold and 7.25 oz. silver. Several carloads ran from 20 to 22 per cent. copper, this high-grade being mainly enargite. This ore has been produced from drifts and stopes from a shaft only 200 ft. deep, but the orebody is from 40 to 60 ft. wide. A tunnel, the total length of which will be 2300 ft., and which will deliver the ore into the railway cars, is now in 1600 ft., and should cut the orebody 300 ft. below the present workings.

In the same district, the Red Mountain Railway, Mining and Smelting Company, owning a large area, including the Yankee Girl, Robinson and others of the early heavy producers, is doing but little owing to financial difficulties. The long Joker tunnel of this concern was stopped owing to lack of funds, within 200 ft. of the Genessee-Vanderbilt vein, from which so much was expected. A few leasers are at work, however, and the Treasury tunnel is working a small force.

Salt Lake City

April 23—Ore shipments from the Tintic district for the past week to the

Tintic and Salt Lake valley smelters were as follows: Centennial Eureka, 40 cars; Colorado, 28; Iron Blossom, 33; Sioux Consolidated, 16; Brooklyn, 6; Dragon Iron, 29; Ajax, 2; Beck Tunnel, 7; May Day, 2; Yankee, 2; Black Jack, 2; Eureka Hill, 1; Bullion Beck, 2; Swansea, 4; Mammoth, 21; Laclede, 1; total, 196 cars.

The annual meeting of the Emma Copper Mining Company resulted in the election of the following officers and directors: John A. Kirby, president; Joseph Lipmann, vice-president; H. S. Joseph, treasurer; W. M. Wantland, secretary; these officers, with H. E. Peery, of Ogden, constitute the directorate. The company owns a number of patented claims in the Alta district.

It is announced that interests affiliated with the Nevada-Douglas Copper Company have formed a corporation for the purpose of providing a custom smelter in the Yerington district in Nevada. It is understood that the construction company, to whom the contract for the railroad has been awarded, has agreed to have the railroad from Wabuska to the Nevada-Douglas mine, completed and running by August 1. The Orem interests have recently acquired the townsite of Morningstar, near the mines, and it is understood that they have rejected the overtures of well known smelting interests to erect a plant in the Yerington district, and take a controlling interest in the Nevada-Douglas properties.

At the annual meeting of the Utah Consolidated Mining Company, Sidney Chase, of Chase & Barstow, bankers, of Boston, was elected a director to succeed James Phillips, Jr. Other retiring directors were reelected. At the annual stockholders meeting of the Utah Copper Company, on April 23, the following directors were reelected: J. Dawson Hawkins, C. M. MacNeill and Spencer Penrose, all of Colorado Springs; D. C. Jackling, of Salt Lake; Charles Hayden, of Boston; W. B. Thompson and John Hays Hammond, of New York, and K. K. MacLaren, of Jersey City. Mr. Hammond was reelected managing director. The following officers were reelected: President, C. M. MacNeill; vice-president and general manager, D. C. Jackling; secretary and treasurer, Spencer Penrose.

Goldfield, Nevada

April 23—Four hundred and twenty men are employed by the Goldfield Consolidated Mining Company. The amount of ground broken in the various properties for January and February was: Combination, 1656 ft.; Mohawk, 986 ft.; Red Top, 1818 ft.; leasers, for January, 1489 ft. The Clermont shaft is 1050 ft. deep and is connected with the Mohawk workings at the 600 ft. level by a 1000-ft. crosscut. A station has been cut on the 1000-ft. level, from which point

lateral will be run to thoroughly explore the property at this depth. This ore shoot, as developed, shows a width varying from 40 to 50 ft., and from 80 to 100 ft. long. It is opened up on the 230-, 280- and the 380-ft. levels. The tonnage of ore extracted and treated for the first three months of the year was: Mined, 45,967 tons; milled, 45,606 tons; shipped, 341 tons. From this the net profits are estimated at \$1,584,436. The costs for mining, milling and transportation are: January, \$7.136; February, \$6.315, and estimated for March at \$5.85 per ton. The results obtained in the new mill are highly gratifying to the management, and a comparison of cost sheets shows that it is treating the same grade of ore at less than one-half the amount per ton as charged against the Combination mill.

J. F. Brim, of the Ely Amalgamated Copper Company, has been advised that the Steptoe Valley Smelting Company has deeded back to the Government a strip of land $1\frac{1}{2}$ miles long by $\frac{1}{2}$ mile wide near the smelter. Some of this territory has been claimed by mining companies and individuals and this action on the part of the Steptoe company is a victory for the other owners. Among those who will be benefited is the Ely Amalgamated Copper Company. This ground is within 100 ft. of the smelter. They will at once take steps to obtain patents for their claims and will begin the shipment of ore to Utah smelters at an early date.

The report of the State bullion tax agent, James F. Haley, submitted to Governor Dickerson April 16, shows a gold production of \$14,373,545 for the year of 1908, the tax collected on this being \$101,000. The production by counties is as follows: Nye, \$6,517,174; Esmeralda, \$4,917,507; Lincoln, \$890,606; Storey, \$700,645; Eureka, \$454,426; White Pine, \$207,101; Humboldt, \$103,850; Churchill, \$100,074; Elko, \$02,854, and Lyon, \$47,360.

Toronto

April 24—The Department of Public Works has begun the survey for a wagon road from Charlton to Gowganda, for which \$50,000 has been appropriated. It is expected that the work of construction will begin in June.

The Ontario government has issued an order in council throwing open to prospectors 1,439,300 acres of land in Algoma district, lying north of Sault Ste. Marie. The land was set aside as a grant to the Algoma Central & Hudson Bay railway, about five years ago, and closed to all prospectors except those of the company. It is now declared open to all until Dec. 30, 1910, unless the company completes the road to the main line of the Canadian Pacific before that time. It is provided, however, that all discoveries of coal, iron ore, iron pyrites, or nickel ore belong to the railway.

Mining News from All Parts of the World

New Enterprises, Installations of New Machinery, Development of Mines and Transfers of Property Reported by Special Correspondents

THE CURRENT HISTORY OF MINING

Alaska

FAIRBANKS

A half million dollars is expected in the haul up on 17 below on Goldstream. The property is worked on lays. Many other claims in this vicinity are making good, while the lode claims are coming to the front.

NOME

More than 20 good placer properties are showing renewed activity in this vicinity, with expectations of large gold outputs.

VALDEZ

Ellamar Copper—Operations were suspended some time ago because of the dangerous proximity of their main workings underneath the sea to the ocean floor. Regular work will be resumed after the completion of a cofferdam to keep the water of the ocean away from the working zone. The dam will be built under the direction of C. A. Middlekamp, superintendent.

Sunrise District—Julius Singer has purchased the Harry Ellsworth claims and will install a dredge with a capacity of 2000 yd. of gravel per day.

Moose Pass—Twelve miles from Mile 29 on the Alaska Central railroad is a new district containing placer and quartz. Free-milling gold quartz is also reported from Indian creek. Quite a stampede has occurred to Moose creek.

Matheson Brothers—The property near Hope is to be worked this summer with a steam shovel, a new experiment in placer mining in the Cook's Inlet country.

Alaska Central Railway—Bonds have been issued to the extent of \$250,000 as a first lien on the property. The money will be expended in extending the railroad from Mile 52 to Mile 74.

Copper River Railway—The immediate construction of a branch to the coalfields is being considered to bring about their rapid development for commercial use. Two broad-gage locomotives were loaded in Seattle for shipment North, and upon their arrival train service will be inaugurated over 55 miles of road.

Arizona

Copper Production for March—The production of copper in Arizona for March amounted approximately to 27,070,000 lb., distributed by mines as follows:

	Pounds.
Copper Queen.....	8,500,000
Cahumet & Arizona, Superior & Boston...	4,300,000
United Verde.....	2,900,000
Old Dominion.....	2,970,000
Detroit.....	2,100,000
Arizona Copper.....	2,950,000
Shannon Copper.....	1,850,000
Imperial Copper.....	1,300,000
Miscellaneous.....	500,000
Total.....	27,070,000

COCHISE COUNTY

Cahumet & Arizona—Four of the six furnaces are in operation.

Superior & Pittsburg—One of the largest orebodies in the Bisbee district has been opened on the 1200 level of the Hoatson shaft.

Copper Queen—Seven furnaces are in operation, and the April output is estimated at 8,500,000 lb. of copper.

Centurion-Arizona—Recent shipments to the smelter at Douglas are reported to yield 14 per cent. copper.

Leadville—While grading for the Mexico & Colorado railroad between Gleason and Courtland, a body of carbonate ore carrying 7 per cent. copper was opened, at a depth of 12 ft. The deposit is said to be 50 ft. wide.

Shattuck & Arizona—A high-grade copper carbonate ore, 5 ft. thick, was opened recently on the 600 level.

GRAHAM COUNTY

Stevens Copper—A large amount of prospecting work has been done recently. Development work will begin soon.

MARICOPA COUNTY

Vulture—The first cleanup yielded 115 oz. gold bullion, valued at \$1800. The large orebodies have been reencountered on the 450-ft. level.

YAVAPAI COUNTY

Copper Chief—The large orebodies blocked out are crushing the old timbers, which necessitates retimbering many of the drifts and stopes.

Grand Island—The double-compartment shaft is now 100 ft. deep. Superintendent Wilson announces the early delivery of the new steam plant, with which sinking will be continued to a depth of 300 ft. A talc formation has recently been encountered accompanied by a heavy flow of water.

Arizona Power—The early delivery of electrical power will greatly stimulate mining in this district. The substation at Jerome is nearly completed.

Cleopatra Copper—Electrical machinery is being installed. A 12-drill, electric, Ingersoll-Rand compressor is now on the

ground, and a 30-h.p. electric hoist has also been delivered. This hoist will be operated in the winze located 1200 ft. inside the Dillon tunnel. The ore consists chiefly of chalcopryite and black oxide, occurring in a porphyritic formation.

Butte & Verde—Messrs. Mulcaire, Bradley, Shea and others, of Jerome, have recently incorporated a group of 10 claims near Allen Springs, as the Butte & Verde Gold and Copper Company. Capital stock is \$1,500,000, divided into 1,500,000 shares of the par value of \$1 each. The property is partially developed by 200 ft. of tunnel.

YUMA COUNTY

Golden Star—The initial dividend of 1 per cent. was declared payable May 15. The milling facilities will be increased early in May.

California

AMADOR COUNTY

Plymouth Rock—Pritchard Brothers, lessees, near Plymouth, are extracting gold from the pocket recently discovered.

BUTTE COUNTY

Butte Creek—The power line from Centerville has been connected with this new dredge and active work on the gravel bed has commenced.

CALAVERAS COUNTY

Voinich—Ore has been found running \$8 per ton and a 40-stamp mill is planned.

EL DORADO COUNTY

Prevolcanic Channel—After a partial suspension of operations for some weeks on account of stormy weather, work has been resumed with a large force. The gravel is cemented and must be milled.

FRESNO COUNTY

Arkansas—At this property near Trimmer Springs, J. F. Ellwood vice-president, the miners are taking pay ore from the tunnel. There has been considerable snow in that section of late.

INYO COUNTY

Bishop Creek—Development on the ore-shoot continues favorable. The sinking of another 100 ft. of shaft has commenced and three shifts of men have been set at work again.

MARIPOSA COUNTY

E. J. Mahoney, of San Francisco, has

purchased for Eastern men, the Rattler, Cold Springs, Hidden Treasure and half of the Lucky Strike, at Mountain King, on the Merced river in Hall's gulch. These claims will now be suitably equipped and developed.

MONO COUNTY

Bodie—The Syndicate mine and mill, under lease to the New Bodie Mining Company, is being worked on the leasing system. Goldfield men are about to begin operations on the Snowdrift claim. The Reading-Meagher properties are to be developed this summer.

NEVADA COUNTY

California Exploration Company—This company has bonded the old Nichols mine near Grass Valley and has commenced pumping out the old shaft. Oscar Coffin is manager.

Pittsburg—Manager Kerr has finally cleaned out the long drain tunnel and the water is flowing out that way. The main shaft has been partly cleaned out and re-timbered.

Spenceville—There is a renewal of activity at this copper camp. C. C. Bittner and Otto Woehler are taking out excellent ore from their copper properties.

Native Son—The strike of rich ore at Blue Tent, a few miles from Nevada City, was in the main tunnel 800 ft. from the entrance. The mine was worked years ago, but was abandoned, and now Wisconsin men have taken charge of it.

Central Consolidated—At Banner Mountain, seven miles east of Grass Valley, in Nevada county, has showed up a valuable body of ore.

PLACER COUNTY

Orpheum—A new electric pumping and hoisting plant has been installed and a mill will shortly be put up. Chas. Peach is superintendent.

PLUMAS COUNTY

The drift mine on Spanish Peak, C. W. Fagg superintendent, has resumed operations after being closed down all winter.

SHASTA COUNTY

Esperanza—A new hoisting plant, air drills, etc., have been provided. The work of developing the property has commenced. A. J. Oswald is manager.

SIERRA COUNTY

Chippis—At Sierra City a new vein has been found carrying exceptionally high-grade ore.

SISKIYOU COUNTY

Scott River Dredging Company—This company is now handling a large amount of gravel with the new dredge.

TUOLUMNE COUNTY

Little Bonanza—This mine, near Sonora, has been leased to C. P. Curnow,

Jr., and D. G. Peters has been appointed superintendent. A 20-stamp mill is to be erected on the property and the mine worked on a large scale.

Tarantula—After testing their ores the company owning this mine near Chinese has decided to install machinery.

United Mines Company—All differences have been settled, the claims paid for, and work has recommenced.

YUBA COUNTY

Northern Gold Mining Company—Organized at Marysville to work certain claims at Brownsville. The principal owner is J. E. Coulsen, of Goldfield, Nevada.

California Mother Lode Mining Company—W. C. Wilkins, president, is about to start work on the mines at Indiana Ranch. A compressor is to be purchased and a cyanide plant built. The mill will be enlarged to 20 stamps.

Colorado

BOULDER COUNTY

John Jay—It is announced that J. A. Reynolds, of Chicago, and associates have purchased this mine at Jamestown and will erect a cyanide mill.

CLEAR CREEK COUNTY

Gambetta—A carload of high-grade zinc ore, also carrying about 40 oz. silver per ton, was recently shipped from this property on Republican mountain.

Mendota Mines—The Mendota mill in the upper Clear Creek district is being operated three shifts and the company is marketing monthly from 50 to 60 tons of lead concentrate and 30 to 40 tons of zinc concentrate, as well as about 200 tons of an intermediate iron product.

Seven-Thirty—Arrangements are being made by George Tarkington, manager, to unwater the shaft and undertake exploratory work.

Terrible—Wood & Co., leasing on the 14th level of this mine on Brown mountain, are obtaining a good tonnage of lead-zinc ore for concentration. Recently a vein of high-grade silver-lead ore from 10 to 20 in. wide was encountered and ore from same is being shipped. Work is also being done in the mine on company account.

TELLER COUNTY

Delmonico—Shipments are being made from the high-grade ore recently encountered on the 300-ft. level of the property on Bull cliff.

Tornado—Humphreys & Thompson, leasing on this mine on Raven hill have been sending out smelting ore for several weeks. The mine is owned by the Elktion Consolidated Mining and Milling Company.

EL PASO COUNTY

United States Reduction and Refining Company—At the annual stockholders' meeting the following directors were re-elected: J. Dawson Hawkins, C. M. MacNeill and Spencer Penrose, of Colorado Springs; H. M. Blackmer, H. A. Dubbs and K. K. MacLaren, of New York, and J. Q. MacDonald, of Florence, Colo.

Idaho

LEMHI COUNTY

Weimer—W. B. Andrew and associates, of Salt Lake City, have taken a two-year lease on the mines on Birch creek. This property formerly shipped 14 to 18 per cent. copper ore, shipment being made via DuBois, after a wagon haul of about 50 miles.

Indiana

CLAY COUNTY

The joint board of miners and operators of the Block coalfield held a meeting April 16 and took up the grievances that occasioned the calling out of 50 men at the Mary mine. The trouble arose over the introduction of machines and the selection of 12 picked men to operate them, leaving 36 men idle. The mine owners proposed to give all of the men an equal share of the work in the mine; the proposition was accepted and the work was resumed April 26.

The board settled another matter which has been causing friction in this district for some time. The chief complaint grew out of the discharge of a cager in a mine of the Progress Coal Company, where, because of work being slack, the man was displaced by the mine superintendent, who looked after other duties. The displaced man was offered another position in the mine, but refused to accept it. The joint board sustained the position of the company, and the men were ordered back to work.

Michael C. White, superintendent, and Thomas Maxwell, mine boss of the Vivian Bogle mine were brought into court charged with failure to keep stretchers and blankets at the mine for use in case of accident, and with driving entries beyond a distance of 45 ft. without cutting a breakthrough. Both men entered pleas of guilty to violating the law in these charges and were fined.

GREENE COUNTY

Keystone Coal and Mining Company—A new shaft is being sunk near Howesville, two miles east of Jasonville. The company has had an option on several hundred acres of coal land in Greene county for two years. The coal from the new mine will be hauled out by the Monon road by a switch to be completed soon.

The work is supervised by Johnson Carmichael.

VIGO COUNTY

Glen Ayr Coal Company—This company, controlled by John Freeman and David Ingle, is opening a mine six miles east of Terre Haute on the main line of the Vandalia railroad which will be put in operation June 1. The mine will have a capacity, when fully developed of 1000 tons daily, and will employ nearly 200 men. The mine will be known as Glen Ayr No. 2; No. 1 being a short distance from the new mine. The tippie for the new mine has been completed.

Michigan

COPPER

Lake—A crosscut has entered the formation and drifting north and south on this lode is under way, with the face of either drift showing the same characteristic richness that has been in evidence in other openings.

North Lake—The Lake lode was tapped with a diamond drill in the No. 3 hole.

Challenge—This property, under the management of the St. Mary's Mineral Lands Company, continues to carry on exploratory work without any material change in conditions. The shaft is about 800 ft. deep. A diamond drill is also operating at this point to ascertain the copper contents of the formation at depth.

Columet & Hecla—An electrically operated hoisting plant has been installed at the slope shaft, 3000 ft. from the 57th level of Red Jacket shaft, and will work the ground adjoining the Tamarack, Jr., property. The shaft is down 2200 ft., at an angle of about 23 degrees, cutting across the face of the lode. The rock coming from this shaft will be hauled to Red Jacket shaft through which it will be hoisted to surface.

Franklin—Drifting is under way on the Pewabic lode at three different points from No. 1 shaft on the 23d, 24th and 25th levels. In all these drifts first-class ore is being exposed. A crosscut to cut the lode at the 26th level is also under way.

Keweenaw—Work will be discontinued soon on the Medora shaft and all activities centered in opening on the Kearsarge lode.

Copper Range—Extensive trenching operations will be carried on in conjunction with the three drilling outfits on the lands held under option from the St. Mary's Mineral Land Company.

Tamarack—No. 1 shaft is being equipped with two large steam pumps, one at the 500-ft. level and the second at the 900-ft. level. These pumps will handle the water coming into the shafts, No. 2 and No. 5, and will eliminate the water hoisting at No. 5 shaft.

Adventure—Preliminary work prior to

beginning the sinking of a new shaft to open the copper-bearing formations that were exposed in the drill cores is under way. This shaft will be south of No. 3 shaft and in a position to command the ground tributary to the three new formations.

Isle Royal—The new high-duty hoisting plant at No. 6 shaft is in commission, using a 7-ton skip. The new shaft on the Baltic lode is down about 350 feet.

Mass—Drifting on the newly opened amygdaloid formation continues with no change in the grade of the ore. The formation at the point of intersection with the crosscut is about 12 ft. wide and assays taken show about 92 lb. of copper to the ton. The copper is evenly distributed throughout the entire face of the lode. This lode was first exposed by a drill core which cut it about 100 ft. below the point it is opened by the crosscut from the 17th level.

Michigan—The copper-bearing lode that was recently opened in the old adit on the Bee tract of this company is holding out great encouragement for its ultimate success. The formation carries a good grade of stamp rock.

Minnesota

IRON—MESABI RANGE

Great Northern Iron Ore Properties—The trustees of these properties, which include the greater part of the northern section of the Mesabi, report that the tonnage mined by operating companies was 3,281,061 tons in 1907, and 1,468,925 in 1908; a decrease of 1,812,136 tons. On the properties leased to the Great Western Mining Company—the subsidiary of the United States Steel Corporation—exploration was prosecuted with vigor with continued satisfactory results. A monthly average of 77 drills has been maintained, as against the 40 required by the terms of the lease. Exploration work has been completed on about 3600 acres of the leased lands. None of the properties covered by the lease to the Great Western Mining Company was put on a shipping basis during the year. Development work, consisting of surface stripping to the extent of approximately 3,500,000 cu.yd. and the construction of yards, tracks, etc., has been conducted on several properties at large expense and in a manner to prepare these properties for mining and shipping large amounts of ore. The expenditures amounted to about \$3,000,000. The total receipts of the trustees were \$1,749,214; expenses, \$75,390, and dividends, \$1,500,000, leaving a surplus of \$173,824 for the year.

The tonnage tax bill, providing for a tax on iron mines based on the tonnage produced, was passed by the Legislature, but vetoed by Governor Johnson. He took the ground that the present system of taxing iron-ore lands had proved satis-

factory, and that the further imposition of a tonnage tax would be unjust, putting an inequitable burden upon the owners of iron lands. The bill failed to pass over the veto.

Montana

BUTTE DISTRICT

Butte-Montana—A spur from the Great Northern Railway is being run to the company's Alex Scott mine. About 100 tons of first-class ore, and the same amount of second-class is in the bins ready for shipment.

Amalgamated—A new shaft is being sunk on the Modoc Extension claim, of the Anaconda company. The claim is directly north of the Boston & Montana company's West Colusa mine.

JEFFERSON COUNTY

Corbin-Wickes—It is reported that a company is in course of organization in Boston for the purpose of acquiring the outstanding stock of this company. A total of 115 acres is owned or under control. The new company will have a capital of 150,000 shares of a par value of \$5 each. It is expected that active mining will begin as soon as additional machinery is installed.

PARK COUNTY

Bear Gulch Placer Mining Company—An action has been instituted against the Kimberly-Montana Gold Mining Company, for the purpose of restraining the latter company from interfering with the water used in a certain ditch near Jardine, Park county. The plaintiff also requests that the court quiet its title to the water right and ditch in question.

Nevada

ESMERALDA COUNTY—GOLDFIELD

Atlanta Cherokee—Two strong quartz ledges have been encountered on the 530-ft. level showing a small amount of gold. Plans have been made to sink to greater depth.

Grizzly Bear Lease—A new 75-h.p. hoist is to be installed. It is expected that the shaft, now 400 ft. deep, will reach the Clermont vein at a depth of about 475 ft. The lease has recently changed hands and is now controlled by W. E. Dowlen, of the Nevada Reduction Company.

Gold Bar—Shipments are maintained at the rate of one carload a week. The ore is said to run \$65 to \$100 per ton.

Goldfield Belmont—This property adjoining the Daisy in the Diamondfield section is preparing to resume shipments. A good grade of ore has been encountered on the 400-ft. level.

Blue Bull—A shipment of five tons was made from the Knickerbocker lease last week. The vertical shaft has been sunk

to a point 100 ft. below the tunnel level and a crosscut started toward the orebody 32 ft. distant.

Florence Goldfield—A strike was made April 10 on the 200-ft. level of the main Florence vein. The stope just started shows a width of 12 ft., 3 ft. of which is high-grade ore, the remaining 9 ft. being milling ore.

ESMERALDA COUNTY—HORNSILVER

Great Western—The winze from the 300-ft. level, now 35 ft. deep, has developed 15 in. of good ore. In the west drift on the 300-ft. level, 3½ ft. of ore is exposed. The first shipments contained 300 oz. silver to 1 oz. gold. The ratio at present is about 30 oz. silver to 1 of gold. Three carloads a week are being shipped.

ESMERALDA COUNTY—HAWTHORNE

Goldfield Alamo—The Hubbard lease has declared a second dividend of \$50,000. The shaft is now 410 ft. deep. The silver content is increasing while lead is diminishing.

ESMERALDA COUNTY—LUNING

Taft—Well defined veins running northeast and southwest, which carry gold, silver and copper, have been discovered. Much work has been done on this property.

Rawhide Western Railroad—The proposed road will give outlet to the east of Rawhide, as well as aid the Fairview and Lodi districts, which have a large tonnage of ores.

ESMERALDA COUNTY—RAWHIDE

Sunbeam—This property has been shut down for a long time owing to legal matters, but has lately been acquired by San Francisco people and is now running regularly. Sulphide ores, carrying gold, have been encountered on the 190-ft. level.

Prosky Reef No. 1—A rich vein has been encountered and is now being farther opened up to determine the extent of the orebody.

Townsite Lcasing Company—W. B. Wedell, of Ogden, Utah, is sinking a new shaft near the vein of the Nugent lease; this firm also operates the Kerns No. 1 lease and the Townsite lease No. 1. On the Nugent property last week a new vein was opened up on the lower level.

Victor—The Goldfield leasers have enough ore in sight to build a 10-stamp mill. It will be erected near the shaft and material has been ordered.

King-Heisner—The machinery and lumber for the 75-ton cyanide mill have been coming in regularly by teams. All of the grading and a great deal of the pipe lines have been completed, including the water tank which is to assist in the water supply of the town. This mill is to be the most complete in the district and is expected to be in operation by June 1, 1909.

LANDER COUNTY—AUSTIN

Austin-Manhattan—The old tunnel which penetrated Lander mountain a distance of 6000 ft. has been cleared and retimbered to the breast. A station is now being cut at its intersection with the Frost shaft, and on arrival and installation of the hoist, the shaft will be sunk to the 1100-ft. level. The compressors are now in place and are capable of supplying 25 power drills. Work will start immediately on the clearing and retimbering a crosscut from the tunnel 2800 ft. long.

LINCOLN COUNTY—PIOCHE

Jack Rabbitt—The crosscut on the 700-ft. level of the Day mine has penetrated ore nearly 400 ft. About half of the ore contains 15 oz. of silver per ton. The same body of ore was encountered on the 600 and 800 levels. The company is now shipping about 60 tons per day.

Mendah-Nevada—About 200 tons were shipped during March. This is principally the ore taken out in development. The shaft has reached the 900 level and the station is being cut.

Pioche King—A new 50-h.p. Alamo hoist with Franklin compressors has just been installed. The property is about two miles southwest of Pioche near the Prince Consolidated Mining Company. The shaft is 50 ft. deep.

NYE COUNTY—BULLFROG

National Bank—The Logland lease has another shipment ready for treatment. The ore is being extracted from the incline between the tunnel and the surface.

NYE COUNTY—PIONEER

Bullfrog Pioneer—This property is now shipping between 75 and 100 tons daily. The compressor and five drills were started April 14, and three additional drills are en route to the property.

Mayflower—The report, covering operations for March shows a net profit of \$7000 from the five-stamp mill, 365 tons of \$30 ore being treated during the month. The best ore yet encountered is exposed in the raise from the 300-ft. level. Development work has also been started on the 400-ft. level.

NYE COUNTY—ROUND MOUNTAIN

Lehigh Antelope—A mill run of 156 tons of ore was made last week from which over 1000 oz. of bullion were recovered, worth slightly in excess of \$12,000.

NYE COUNTY—TONOPAH

Tonopah Mining—The diamond drill has struck ore at a depth of 1600 ft. The Mizpah shaft is now being sunk to catch the ore on that level.

West End and Tonopah Extension—A mill is to be erected to treat the ore from these two mines.

MacNamara—The regular monthly dividend of 1c. per share was declared payable May 5. Last week 300 tons of ore were shipped. The shaft is now 710 ft. deep.

Oklahoma

OTTAWA COUNTY

Miami—That this camp is in a prosperous condition is shown by the fact that of its nine mills all are in operation. These are the Emma Gordon, Golden Hen, Queen City-Joplin, Miami-Yankee, New State, King Jack, Index, Dan Isley and Swastika. The Tom Lawson ground was forfeited and the mill has been removed. The Old Chief mill burned down and the Indianola Mining Company, which was operating the mine, refused to rebuild the mill on a 30-per cent. royalty and has given up the lease.

The Wanhilla is building a mill and will soon be operating. The Turkey Fat, whose ground was developed from the Tom Lawson, is sinking a shaft and will build a mill at once.

On the Sullivan lease one shaft is in ore and another is being sunk to the ore developed by the Old Chief. A mill will be built as soon as this shaft is completed. The Emma Gordon has completed a shaft 1000 ft. north of the mill and has contracted the building of a tram to the mill. This will make four shafts connected with the mill. This company has just made a rich strike of ore in a deeper run northwest of the mill. In spite of the fact that nearly all the companies are operating under third and fourth leases at the outrageous royalties of 25 to 35 per cent. the camp is progressing.

Oregon

LANE COUNTY

Bohemia District—An exhibit of representative ores for the Alaska-Yukon-Seattle fair is being gathered and will be exhibited in Cottage Grove for a time before it is shipped to Seattle. The specimens, collected to date from Bohemia mines embrace gold, silver, copper and galena. Many of the gold specimens show free gold in abundance.

Oregon Mineral Paint Company—This company, with mines situated four miles north of Cottage Grove, Ore., has purchased three acres of ground at St. Johns, near Portland, and will erect a paint plant. This will give employment to a large number of men at the mine. The raw mineral will be hauled over the Southern Pacific railroad, a distance of 148 miles from mine to the plant.

Kelso—W. P. Ely, secretary, will have men put to work on the new plant which was started last fall, and was shut down on account of deep snow.

Combination Mines—R. H. Clark and Sherman Clark have purchased a large amount of supplies for their milling plant, part of which is on the ground.

Golden Rule—R. L. Ormsby states that his company intends to install its milling plant this spring. Work has been in progress at the mine all winter.

South Carolina

YORK COUNTY

A tract of 1500 acres of land containing deposits of manganese has been purchased by H. F. E. Gammon, of Rutherford, N. J. The ore is reported to contain 51 to 60 per cent. manganese, and $\frac{1}{2}$ per cent. phosphorus.

South Dakota

LAWRENCE COUNTY

Speculation is rife regarding the revival of tin mining. There seems little doubt that tin exists in the Tinton district of the Black Hills, though no extensive development has been done. Milling on a small scale has been carried on, but in order to make the operation a paying one a large tonnage and modern concentrating machinery are essential.

Hercules—Grading is about completed for the 40-stamp cyanide mill under construction, and the foundations are being put in. The mill is expected to be in operation this fall.

Altia—The work of unwatering the mine, until recently known as the Puritan, is now under way.

Golden Crest—The mine has been unwatered below the 125-ft. level, where the workings were found in good condition. The new mill is expected to be in operation by June 1.

Utah

SALT LAKE COUNTY

Bingham Mines Company—The Dalton and Lark mines have recently been operated by leasers who have been shipping lead-silver ores. In view of the completion of negotiations for acquiring title to the mines formerly belonging to the Bingham Consolidated Mining and Smelting Company, preparations are now being made to operate these mines more extensively.

Columbus Consolidated—Ore is now being shipped to the Pioneer sampler at Sandy. As soon as possible the shipments will be increased to 100 tons per day. The upraise from the 400-ft. level is about 100 ft. in ore. The width of the orebody is about 40 feet.

Kennebeck—A compressor has been purchased and will be installed as soon as the snow is off the ground.

South Columbus—Ore has been encountered in a winze 70 ft. below the tunnel level in the eastern part of the property. Sinking is to be continued 30 ft. farther.

SUMMIT COUNTY

Ontario Mine—Arrangements are being made for the driving of a tunnel from the 600-ft. level which will tap the Wabash at a depth of 800 ft., the New York at a depth of 1000 ft. and the Nail Driver at a depth of 1100 feet.

JUAB COUNTY

Yonkee Consolidated—The power plant which was disabled, owing to the presence of acid in the water, has been repaired and the company is continuing its development work.

Tintic Volcano—The new shaft is now about 60 ft. deep. The property flanks that of the Tintic Standard on the east.

Iron Blossom—A 15-drill Ingersoll-Rand compressor has been purchased to provide the mine with independent power. Compressed air is now being obtained from the Colorado mine, but the development of the Iron Blossom and the possibility of the sale of the Colorado mine and Tintic smelter have apparently made it desirable to be independently equipped. The stock of the company has recently suffered a severe decline on the Salt Lake Exchange.

Uncle Sam Consolidated—A winze recently opened a large body of ore that is said to carry 50 per cent. lead with a fair silver and gold content. It is expected that regular shipments will be resumed as soon as suitable smelting arrangements can be made.

Washington

ASOTIN COUNTY

West Coast Portland Cement Company—This company recently installed a complete experimental plant at Asotin, to thoroughly test the merits of the cement-making raw materials with a view of installing a plant of large capacity.

SNOHOMISH COUNTY

Wayside Mine—The vein encountered by the tunnel is equal to expectations. The Atlas Corporation, which owns this property, was so badly in debt that it passed into the hands of a receiver. The staunch men of the corporation advanced a substantial sum for development work, and this was carried out under the management of Receiver Edward Hawkins. All of the obligations of the Atlas Corporation are paid.

Wisconsin

ZINC-LEAD DISTRICT

Benton—The Calvert property has been taken over by Wm. N. Smith and associates; a 75-ton mill will be provided. The mine is opened up by 100 ft. of drift, showing heavy sheet jack; the pitch is crosscut 40 ft., carrying a 30-ft. stope. A 12-ft. vein of sheet and disseminated jack has been penetrated by shaft on the Fields land, five miles southeast of Benton, by Robert W. Hunt & Co. The shaft is completed at 184 ft.; the range is proved a quarter mile by drilling. The Lucky Twelve Mining Company will place machinery equipment on its prospect just north of the Fields; a rich deposit of jack is proved by shaft and drill at 130 ft. The

Fox Lead and Zinc Company has obtained siding facilities from the Northwestern railway, and is building an aerial tram to load its ores direct on cars; the mine is turning out from four to six cars of zinc concentrates weekly.

Canada

BRITISH COLUMBIA—CARIBOO

Preparations are being made for the opening of the placer gold-mining season. Gravel washing is usually commenced during May of each year, and the indications are that it will be practicable to get the water running in flumes and ditches by the middle of that month.

BRITISH COLUMBIA—PEACE RIVER

The provincial government is sending F. C. Campbell, for many years mining recorder at Trout lake, Lardeau district, to the Peace river country. This big district is being made reasonably accessible by the construction of the Grand Trunk Pacific railway. As the occurrence of gold and coal in it have both been repeatedly reported, Mr. Campbell will be gold commissioner for the district, as well as official representative of the government in other departments.

NOVA SCOTIA

Dominion Iron and Steel Company—Owing to the favorable settlement of the litigation with the Dominion Coal Company, the directors decided to adopt a liberal policy as to dividends. A cash dividend of 10 $\frac{1}{2}$ per cent. was declared on preferred stock payable May 10, toward clearing off arrears, which will leave dividends for 4 $\frac{1}{2}$ years amounting in all to 31 $\frac{1}{2}$ per cent. still due. It is proposed to clear off the balance of accumulated dividends as rapidly as the income will permit, devoting to that object all further moneys received on the claim against the Coal Company. The total claim for damages is placed at \$3,951,092, which, deducting the \$2,750,000 received on account, leaves a balance of \$1,201,092 to be paid.

ONTARIO

Lake Superior Corporation—Subscriptions were received by the Bank of Montreal in Montreal and London from April 14 to 19, for \$5,000,000 first mortgage collateral trust 40-year 5-per cent. bonds, part of the issue of \$10,000,000 dated 1904, of which about \$9,000,000 have long been outstanding, but largely held by the Canadian Improvement Company. These bonds are a first charge upon certain landed property of the corporation and, directly or indirectly, on all of the stock and bonds of the subsidiary companies. The proceeds of the bonds are to be used chiefly for improvements and additions to the works at the Sault Ste. Marie.

ONTARIO—COBALT DISTRICT

Ore Shipments—Shipments of ore from Cobalt for the week ended April 17 were

as follows: Buffalo, 60,930 lb.; Chambers-Ferland, 60,000; Coniagas, 63,615; Crown Reserve, 119,480; La Rose, 485,468; McKinley-Darragh, 66,900; Nipissing, 130,240; Right-of-way, 150,680; Temiskaming 60,200; total 1,197,513 pounds.

Chambers-Ferland—The raise which was run to the surface of this property by the Right-of-way mine is now in operation. An air line has been laid to the mouth of the shaft and a drill put to work on La Rose vein. Stopping is being undertaken on the main vein on the 150-ft. level of No. 1 shaft.

Foster—The company has entered into an arrangement with the Argentum Mines, Ltd., by which the latter company is to operate the Foster mine for five years in connection with its own mine.

Green-Meehan—In accordance with the decision of the shareholders, a transfer of the assets of this company has been made to the Consolidated Silver Cobalt Mines, Ltd.

Kerr Lake—S. R. Heakes, manager, states that the company is limiting its output to two tons of ore per day, and that for each ton mined three to four tons are being put in sight. The total cost of production, including everything, is 7c. per oz. of silver. The average of this year's shipments has been 3300 oz. silver to the ton.

La Rose—This company has acquired the Lawson property, which has been for a long time in litigation, taking over the outstanding shares of the Lawson mine, Ltd., in exchange for its own stock. Surface prospecting and development work on the Lawson will be begun immediately.

Silver Leaf—Another small vein about 2 in. in width, carrying native silver, was recently struck in drifting toward the Foster and is being followed up. The present force consists of 16 men and two drills.

Crown Reserve—A financial statement covering the first three months of the present year has been issued, showing a surplus at the end of March of \$437,302. Ore was shipped to a total net value of \$452,405. The company paid \$45,779 for operating expenses, spent \$10,949 on plant, and paid \$40,168 royalty to the provincial government. Out of the balance \$256,322 was paid in dividends, leaving a surplus of \$90,185. General Manager Cohen states that at the depth of 75 ft. in the west winze below the 100-ft. level the vein is strong and yielding rich ore. A winze is being sunk at the east end of the same vein which will block out ore on three sides. In prospecting crosscuts during the last three months eight veins have been cut, three of which are from 3 to 4 in. in width with rich ore, the other five running from 1 to 1½ in. wide, with good silver contents.

ONTARIO—SOUTH LORRAINE DISTRICT

Haileybury—This company has sold 20

acres, being the southern part of its property, to C. M. Ehrlich, New York, and H. G. Wood, Buffalo, for \$100,000.

QUEBEC

McDonald Copper Mine—The Eastern Canada Smelting Company has bought this mine, which is in Weedon township, Wolfe county, near the Quebec Central railway.

Mexico

CHIHUAHUA

Dolores—The February production amounted to \$79,000, of which \$29,000 is reported as profits. According to estimates the March output was slightly in excess of this.

Rio Plata—The new cyanide plant will be in commission soon. The manager, D. W. Shanks, accompanied by President Miller and others from New York, recently inspected the property.

Dos de Abril—The Huizopa Mines Company has succeeded the Dos de Abril Mining Company. The officers of the new corporation are arranging for the resumption of work on a larger scale. The home office of the company is at Cleveland.

Candelaria—This company, operating in the San Pedro camp, is shipping about six cars of lead ore daily. Other active properties in this camp are the Cinco de Mayo and Durack.

Parral Output—The production of the Parral camp for the week ending April 9 was 10,120 tons, as compared with 9410 tons for the week preceding. The district, particularly in the Santa Barbara section, is showing constant improvement.

Republica—It is officially reported that the first dividend will be paid during the month of May. The property is maintaining a steady production from its cyanide plant. Lately explored orebodies insure a large tonnage of 100-oz. silver ore. J. Gordon Hardy is consulting engineer and manager.

Santa Mathilde—J. W. Cowan and associates of Tennessee have taken a bond and lease on this and adjoining claims situated in the Dolores district, near the Sinaloa line. A three-stamp mill, concentrator and small cyanide plant have been ordered from San Francisco. The ores are gold and silver with the gold predominating.

GUANAJUATO

Guanajuato Consolidated—Report for March: The mill ran 29 days. Estimated value of concentrates, \$41,000; total gross value in products, \$93,000; less working expenses, including marketing of bullion and freight and treatment charges on concentrates shipped to smelter, \$69,050; estimated profit, 23,950 pesos. Of this 11,700 pesos were expended on development account; amount of development work done, 345 feet.

JALISCO

Cinco Minas—H. E. Crawford has an option on these mines for \$520,000. The first payment of \$50,000 has been made.

Amparo—The second quarterly dividend of 2½ per cent. will be paid May 10. The mine entered the dividend list last February.

OAXACA

Mimiaga—The discovery of a new and rich orebody is reported.

SINALOA

San José—Francis Breuil has installed a two-stamp mill on the San José gold mine near Palmarito, and is now developing the mine.

Las Tajos—Engineers representing D. M. Barringer and associates, of Philadelphia, recently examined this and the Mina Grande mine in the Santiago de los Caballeros district.

Palmarito—A small force of men is working in the mine, pending the successful solution of trouble with the mechanical roasters in the lixiviation plant. C. Dupree Smith is now in charge of the work.

West Coast—The concentrating plant, situated in the Los Tajos district, is producing high-grade copper concentrates, which carry some gold and silver. Additional machinery and equipment has been ordered from Denver, which will double the present capacity of the mill. A vertical shaft is being sunk on the Rio mine to cut the vein 235 ft. below the present working tunnel. The shaft is being sunk with hammer drills. A hoist and equipment has been shipped for use on this shaft.

San Antonio—The bond and lease which was held by Southern Pacific interests, on the San Antonio and Estrella del Norte mines, situated in the Las Chivas district, expired March 20. The mines are owned by Castro Brothers and Jesus Imesquita. The option will not be renewed.

Jesus Maria—The February output was 120 kg. of gold bars, assaying about 700 fine.

Rosario—Situated near the Jesus Maria mine in the San José de Gracia district is working about 100 men and is producing a good milling grade of ore. Notwithstanding the death of Antonio Echavarria, the discoverer and one of the principal owners, the usual shipments of bullion are being made.

Toro Bueno—Edward Cook has taken an option for 18 months on this mine from Serapio Lopez and associates. The purchase price of \$50,000 is payable in four payments, due in 3, 6, 12 and 18 months. Work was started at once on the mine and the force is being increased.

ZACATECAS

San Roberto—Since the South African company began operations, the output is \$20,000 to \$30,000 per month.

Metal, Mineral, Coal and Stock Markets

Current Prices, Market Conditions and Commercial Statistics of the Metals, Minerals and Mining Stocks

QUOTATIONS FROM IMPORTANT CENTERS

Coal Trade Review

New York, April 28—Coal-trade conditions in the West show little change. The demand for steam coal continues to improve slowly, but domestic trade is off. The Lake trade has hardly begun, and is held back by the current dispute over rates from the mines to Lake Erie ports; and also by the delay in starting ore shipments, which makes the offerings of tonnage light. A late opening is looked for; meantime stocks of coal on Northwestern docks are gradually disappearing, although no scarcity has yet been felt.

The anthracite situation is still an open one. Conferences have been held between the operators' committee and the representatives of the miners. The current report is that the miners have agreed practically to renew the old agreement for three years with a few unimportant modifications, which are nominal rather than actual concessions. The whole matter is before a district convention at Scranton, which is now in session, and it is not altogether safe to predict the result. All that can be said is that present chances seem to be against a strike, but a positive statement will not be safe until the agreement has been signed.

The Seaboard bituminous trade is in a disturbed condition, owing to the action of the West Virginia railroads and operators in making rates on coal delivered at the seaboard at prices which imply an exceedingly low freight rate. How long this condition will last is uncertain. An important point is that the Pennsylvania Railroad Company has purchased the large block of stock of the Norfolk & Western which it sold over two years ago. This purchase will give the Pennsylvania once more a controlling voice in Norfolk & Western affairs and will doubtless lead to some adjustment of coal rates. Reports, however, which were started from Philadelphia, have it that the new Virginian railway and the Chesapeake & Ohio will continue to make low rates. The Virginian road, it is said, intends to secure as large a share as possible of the bituminous coal trade with a view to concentrating that trade. These reports recall the rumors of a bituminous coal trust on a large scale which were current five or six years ago and must be accepted with caution—except insofar as that the Virginian people are doubtless out for all the business they can get.

The Hocking Valley Combine—The Circuit Court at Columbus, O., has decided that the holding of coal-company stocks by the Hocking Valley Railroad Company is in contravention of the State law; also that the proposed combination with the Kanawha & Michigan and other roads is contrary to law, as they are parallel and competing lines. The case is to be carried up to the Supreme Court on appeal.

COAL TRAFFIC NOTES

Tonnage originating on Pennsylvania railroad lines east of Pittsburg and Erie, year to April 17, short tons:

	1908.	1909.	Changes.
Anthracite.....	1,565,811	1,511,243	D. 54,568
Bituminous.....	9,848,588	10,411,629	I. 562,941
Coke.....	2,089,664	2,936,925	I. 847,261
Total.....	13,504,063	14,859,697	I. 1,355,634

Increase for the week, 202,233 tons. Total increase year to date, 10 per cent.

Shipments reported by Southwestern Interstate Coal Operators' Association, month of January, short tons:

	1908.	1909.	Changes.
Missouri.....	247,103	252,264	I. 5,161
Kansas.....	570,351	534,219	D. 36,132
Arkansas.....	228,052	135,399	D. 92,653
Oklahoma.....	315,952	215,807	D. 100,145
Total.....	1,359,458	1,138,689	D. 220,769

The total decrease this year was 16.5 per cent.

Coal receipts at Boston, three months ended March 31, reported by Chamber of Commerce:

	1908.	1909.	Changes.
Anthracite.....	389,904	362,541	D. 27,363
Bituminous.....	824,000	788,633	D. 35,367
Total domestic.....	1,213,904	1,151,174	D. 62,730
Foreign.....	142,350	76,835	D. 65,515
Total.....	1,356,254	1,228,009	D. 128,245

The foreign coal is chiefly from Nova Scotia mines.

New York

ANTHRACITE

April 28—Business is going on quietly in hard coal, although the dispute between miners and operators is not yet settled. Buying on the April discount has been rather large. No announcement has yet been made as to the May discount and it is not quite certain whether it will be made. It probably depends on the result of this week's conference between miners and operators.

Prices on domestic sizes are \$4.25 for lump and \$4.50 for egg, stove and chestnut, f.o.b. New York harbor. Prices on steam sizes are a little unsettled, as demand is rather in excess of present supply. Current quotations are \$3.10@3.25 for pea; \$2.35@2.50 for buckwheat; \$1.70

@2 for rice; \$1.25@1.50 for barley, f.o.b. New York harbor.

BITUMINOUS

The Seaboard coal trade is disturbed by the action of the West Virginia operators, who are evidently trying to secure business even at low prices. Thus Pocahontas has been offered as low as \$2.15, f.o.b. Lambert's Point, and prices to correspond have been made on New River, f.o.b. Newport News. In their search for trade some West Virginia operators have even offered to make delivered prices at Eastern ports, a practice which was abandoned three or four years ago by general consent; its revival will be witnessed with regret by most dealers.

In current trade buying does not seem to have been revived by this competition. The far East is taking occasional cargoes, but is still dull and sleepy. Along the Sound a small but regular business is noted. New York harbor is doing a little business, but cannot be called active. Prices remain about the same as last week and buyers seem to be waiting the result of the West Virginia action. All-rail trade is fairly active. Car supply is abundant but transportation is a little slow.

In the Coastwise vessel trade boats are still rather scarce, owing to the weather. Rates on large vessels from Philadelphia are nominally unchanged, but smaller vessels are getting an advance of 5 to 10c., making the freight from Philadelphia to Boston about 65c. In New York the smaller vessels are asking from 10 to 15c. more than a week ago.

Birmingham

April 27—The Southern coal market shows a little improvement but it is slight. Little labor has left the district, so confident are the miners that there will be a resumption ere long. The improvement in the coke demand has caused a steady output at a larger number of ovens. It is believed there will be a good demand for coke all through the summer. Some of the larger companies are still stocking coke for future use.

The Star Cahaba Coal Company, with small mines in Shelby county, is in litigation, a petition in bankruptcy having been filed, and a receiver being named.

Chicago

April 26—The coal market continues quiet, with fine coals more and more in demand and lump correspondingly difficult

to sell. There is little demurrage trouble; shipments, speaking generally, are fairly well adjusted to the demand. Hocking Valley coal has been somewhat in overabundance, and occasionally Illinois or Indiana lump has to be sacrificed to be unloaded. Domestic coals are very weak, except anthracite. Contract making is increasing and is in general at low prices. Competition in this as in the open market is keen, and to get hesitating users of coal prices are cut.

Lump and egg from Illinois or Indiana mines sells for \$1.75@2.25; run-of-mine for \$1.65@1.75, and screenings for \$1.40@1.60.

Eastern coals are stronger as general business conditions improve. Smokeless, well held down as to shipments, brings \$3.20@3.45 for lump and \$2.95@3.15 for run-of-mine. Hocking Valley sells for \$2.90@3.15 and is somewhat sluggish. Youghiogheny at \$3.15 for 34-in. gas and Pittsburgh No. 8 at \$2.75 for 34-in. lump are quiet. In the anthracite market something of the briskness apparent is attributed to the lack yet of warm weather, but there are evidences that the average retailer and consumer are laying in supplies early to get the benefit of the spring discounts.

Cleveland

April 27—The coal market is still stirred up over the question of rates on Lake coal. Until that is settled, and until ore begins to move, there will be little coal started up the Lakes.

The local market is quiet and unchanged with possibly a little better demand for steam coal, but no change in prices. Some slack has been sold at a slight advance, as that grade is in light supply.

Indianapolis

April 26—The showing of the leading mining companies of the State for the past week indicates a gradual increase in the output. The orders taken during the past week have caused firmness in the market, although prices remain at a low level. Shops, railroads and power houses are increasing their weekly orders. There is also a manifest confidence in the Indiana coal industry by the several new companies that are sinking new mines, while a number of old companies are making extensive improvements.

Pittsburg

April 27—Production at the railroad mines has increased materially during the past week, the additional tonnage going to Lake ports for shipment to the Northwestern markets. There is also an increase in the local demand, but prices are low. Sales under contract have been made within the past few days at around \$1 per ton for mine-run coal at mine. Large producers are still endeavoring to

hold the price at \$1.15, but the bulk of the business is going at \$1.10. Slack remains at 55@65c. The river mines continue to operate at capacity and a large tonnage is accumulating. The rivers until today were at a good barge stage, and several million bushels went out on the rise. It is estimated that about 60 per cent. of the capacity of the railroad mines is being brought out.

Connellsville Coke—Conditions in the coke trade continue bad and some sales of furnace coke for spot shipment are made at as low as \$1.40@1.50. On contract to July 1 the asking price is \$1.60. One or two large contracts for shipment through the second half were made lately, but the price is not given. Producers are quoting \$1.75 for the last half. Foundry coke also is down, \$1.85 and less being done for spot shipment. On contract the asking price is \$1.90@2.10, but some producers are holding for \$2.25 for late delivery. A number of ovens have been closed during the week and production generally is being curtailed.

The *Courier* gives the production in both fields at 233,151 tons. The shipments were 9127 cars, as follows: To Pittsburg district, 3511 cars; to points west of Pittsburg, 4726 cars; to points east of Connellsville, 830 cars.

Foreign Coal Trade

Coal in Peru—The production of coal and lignite in Peru in 1908 was 185,565 metric tons, an increase of 105,000 tons. The greater part of this coal was mined by the Cerro de Pasco Company and was converted into coke for the use of that company.

Welsh Coal Prices—Messrs. Hull, Blyth & Co., London and Cardiff, report current prices of coal as follows, on April 17: Best Welsh steam, \$3.54@3.60; seconds, \$3.42; thirds, \$3.30; dry coals, \$3.48; best Monmouthshire, \$3.12; seconds, \$3.06; best small steam, \$2.46; seconds, \$2.16. All per long ton, f.o.b. shipping port.

Iron Trade Review

New York, April 28—The iron and steel markets generally show a considerable improvement, as far as the volume of new business is concerned. Activity is gradually developing on several lines and there appears to be a greater confidence in the future.

The large business in structural steel continues. Orders for bridges and buildings come in steadily. Some of these are of large dimensions, but the small orders which naturally predominate make up a very considerable aggregate. A conservative estimate of structural orders for the month of April foots up a total at something over 200,000 tons, this quantity in-

cluding only orders actually placed. Orders for bars have also been liberal at the low prices recently fixed, while in sheets and plates there has been a fair business. In wire products business has not been active, for the reason that further reductions are expected. An exception is found in nails, on which lower prices have been named at Pittsburg, and for which the demand appears to be very large.

Rail orders from domestic roads have not been much in evidence though several small contracts have been placed. There has been quite a business in rails for export, recent contracts including 6000 tons for Panama, 5000 tons for Brazil and 13,000 tons for Mexico.

In pig iron there has been more business than for a number of weeks past, both in the West and in seaboard territory. New England manufacturers seem to be waking up and are taking both foundry and basic iron for second and third quarters, and the same is the case in New York and New Jersey. Buyers seem to have more confidence in the future and also to have made up their minds that prices are near the bottom and are taking iron accordingly.

United States Steel Corporation—This preliminary statement for the first quarter, issued today, gives net earnings and income as below:

	1908.	1909.
January.....	\$ 6,052,743	\$ 7,262,605
February.....	6,709,428	7,669,336
March.....	7,469,834	7,969,327
Total for quarter.....	\$18,229,005	\$22,921,268
Depreciation and subsidiary co. acc'ts.....		\$ 3,736,199
Interest and sinking fund.....		7,911,963
Total charges.....		\$11,048,162
Balance.....		\$11,873,106
Dividends declared.....		8,846,432
Surplus for the quarter.....		\$ 3,026,674

As compared with the December quarter of 1908, the net earnings show a decrease of \$3,304,217; the increase over the March quarter of 1908 being \$4,692,263. The dividends declared for the quarter were the usual ones, of 1¼ on preferred, and ½ per cent. on common stock. The unfilled orders on the books on March 31 were 3,542,595 tons; which compares with 3,603,527 tons on Dec. 31 and 3,765,343 tons on March 31, 1908. During April, however, there was a large increase in orders.

Birmingham

April 27—The tonnage sold for the month of April in the South has been satisfactory. The Tennessee company, which has been selling iron on a basis of \$11 per ton, No. 2 foundry, now quotes \$11.50, while others have been getting \$11.50 per ton right along. There is a little iron on the furnace yards in this district, but not enough to cause any apprehension.

Officials of the American Radiator Com-

pany, of Chicago, are in Birmingham, completing the deal whereby that concern takes hold of the plant of the Birmingham Pipe and Casting Company.

The sale of the properties of the Southern Steel Company, bankrupt, having been confirmed by the special referee, the reorganization of the company is but a matter of form, and the steps looking to a rehabilitation of the work will soon be in hand.

Foundries and machine shops look for a brighter future also. It is announced that the Payne & Joubert foundry and machine shops in this district will be more than doubled in the next few months, plans now being in hand.

Baltimore

April 26—Exports for the past week included 3,058,200 lb. steel billets to Liverpool. Imports included to ingots electric steel from Antwerp; 20 tons spiegeleisen and 746 tons ferromanganese from Liverpool; 4950 tons iron ore from Cuba.

Chicago

April 26—The iron market seems to be strengthening both for pig iron and finished products. Contracts for third- and fourth-quarter deliveries of pig iron are more numerous and Southern interests are trying to hold the price of No. 2 firmly up to \$11.50 Birmingham, or \$15.85 Chicago. Some sales, however, are undoubtedly made at less. Melters are inclined to increase their purchases for needs of the next three months also, buying with more confidence. Some Southern iron is selling at \$12, Birmingham, in small lots. There is no decided turn of the market, but conditions are more encouraging for the seller than in many weeks past. Northern iron remains quiet and steady, with No. 2 selling for \$16.50 @17, and local furnaces supplying the demand closely. Lake Superior charcoal remains at \$19.50@20.

Iron and steel products are in increasing demand generally, though sales are not notably large in the two very heavy lines, railroad supplies and structural material. Coke is improving in demand, though the best Connellsville remains at \$4.70, Chicago.

Cleveland

April 27—Ice still holds at the Sault but it is believed that boats will be able to get through in a few days. Several vessels have started, having no difficulty in getting crews, notwithstanding the orders of the unions. Nothing definite has been settled about iron-ore prices, and the only sales have been a few small ones from dock stocks.

Pig Iron—Buyers seem to have made up their minds that prices are as low as they

will go, and there has been a good local business in foundry and basic for second and third quarters. Prices are on a basis of about \$15, Cleveland, for No. 2 Northern foundry.

Finished Material—Good sales are reported of structural material, with a fair business in bars and plates.

Philadelphia

April 28—Inquiries for basic iron made a week or so ago have developed into orders, and two or three large sales have been effected on which deliveries will be made in May. In other kinds of iron makers have been obliged to submit to shading in order to effect sales on account of the persistent shading of Southern irons. Quite a number of small buyers in this territory have been in the market within a few days and have bought more liberally than for months. Some consumers are beginning to purchase more material than the work in hand called for. Very little iron is being bought for third-quarter delivery, though business of this character is known. Forge iron continues to drag.

Steel Billets—More steel billets have sold within the week, but delivery is uncertain, the buyers feeling that now is a good time to secure themselves. These sales show a slight reduction from recent quotations.

Bars—Bar iron is quoted at 1.30 for refined and 1.25c. for common, with an unsatisfactory demand. Large consumers are withholding orders or buying small lots.

Pipes and Tubes—Locomotive work is improving steadily. The Pennsylvania Railroad Company has ordered the construction of 44 engines of large capacity. The small-shop demand for tubes is better.

Scrap—The scrap market is dull, although there are more buyers looking around for supplies, but only for present wants. There is more inquiry for cast scrap than for any other kind this week. Railroad scrap is dull and is held for higher figures. The stock is quite large and the dealers feel that there will be no difficulty in unloading it a little later.

Pittsburg

April 27—The improvement in the iron and steel trades which set in about the first of the month has gained additional force, and the whole position of the market is distinctly better. The current bookings are at a greater rate than at any previous time this year and are well ahead of the average of last year. Production is also larger. The Carnegie Steel Company is producing 21,000 tons of steel ingots daily, its full capacity being 28,000 tons. The sharp competition in steel bars, structural shapes and plates has resulted in good bookings.

As a result of this position the Carnegie Steel Company this morning advanced its prices on bars, plates and shapes \$1 a ton, and decided not to take business as far ahead as formerly. Its new prices are not absolutely fixed, being flexible as were the old prices. The new prices, for attractive business, are 1.15c. for bars and 1.25c. for plates and shapes, at Pittsburg, prices for Chicago delivery being 15c. per 100 lb. higher. When the break occurred in February bars at once dropped to 1.20c. and plates and shapes to 1.30c. These prices held for a short time, but of late have been shaded very generally, bars being sold regularly by two or three interests at 1.10c., occasionally at slightly less, while shapes and plates sold at 1.20c. and in the case of specially attractive tonnages as low as 1.10c. was done.

There has been sharper competition in wire nails, and 10c. a keg under the official price of \$1.95 is being done regularly on attractive orders. Some producers are now comfortably filled up for two months. There has also been sharper competition in small spikes, which have been sold in some cases as low as \$1.60 per 100 lb., the old price being \$1.80. Standard railroad spikes have been shaded 5c. to \$1.65.

Pig Iron—There has been much more active inquiry in the past week, and sales have been larger than at any previous time this year. The Massillon Iron & Steel Company, the independent cast-iron pipe interest at Massillon, O., has bought 20,500 tons of northern foundry iron, for delivery in the second half, paying on the basis of \$14, Valley, for No. 2. The International Harvester Company, Allis-Chalmers Company and General Electric Company have bought, following the purchase of 10,000 tons by the Westinghouse Electric & Manufacturing Company. Some good inquiries have appeared from Pittsburg consumers. For prompt delivery foundry and basic iron can be had at \$14, Valley, or \$14.90, Pittsburg, but for third quarter at least 25c. advance is demanded. Bessemer has been quiet, at \$14.75, Valley, for prompt, \$15 and upward for second half.

Steel—The market is somewhat firmer. Some mills at a distance from Pittsburg would shade nominal prices, but for Pittsburg delivery billets are firm at \$23. Shipments have improved on old contracts.

Sheets—Demand has slightly increased. Prices remain at 2.25c. for black and 3.25c. for galvanized, 28 gage, ordinary carload lots, while on attractive orders a concession of \$1 a ton is given.

Ferromanganese—Prices quoted show quite a range, as a few low sellers are making the market, others quoting much higher prices. On ordinary carloads the market is about \$42, seaboard, or \$43.95, delivered Pittsburg, but on large lots \$41, seaboard, could be done.

Metal Markets

New York, April 28—More activity in business is noted in several lines, and there is a measurable degree of improvement.

Year 1909..	14,473,930	10,463,218	" 4,020,712
" 1908..	12,686,287	10,830,666	" 1,755,631

Exports from the port of New York, week ended April 24: Gold, \$2,600,250, chiefly to Argentina and Brazil; silver, \$729,870, chiefly to London. Imports: Gold, \$111,286, from Central and South America; silver, \$82,316, from Japan, Australia and Mexico.

Gold—Prices on the open market in London are at the normal point, 77s. 9d. per oz. for bars and 76s. 4d. per oz. for American eagles. The Bank of France is again buying gold, but there is no sharp competition. In New York exports continue to Argentina and Brazil; some gold has also been taken for shipment to Paris.

Platinum—Business continues on a fair scale with prices unchanged at \$23@24 per oz. for refined platinum, \$26 for hard metal and \$19@21 for scrap.

Our St. Petersburg correspondent reports under date of April 15 that a fall in prices is to be noted. The larger dealers will not sell at current quotations, as they expect a rise; but there is some metal in the hands of weak holders and this has affected quotations. At Ekaterinburg the nominal price is still 5 rubles per zolotnik, but small holders have sold at 4.60@4.80 rubles—equal to an average of \$17.67 per oz. for crude. In St. Petersburg crude metal, 83 per cent., is offered at 18,000@19,000 rubles per pood—average \$18.13 per oz. It is expected that these weak holders will soon be sold out.

Silver—Silver has shown some strength this past week, owing to purchases on China account and recovering by speculators of silver sold short at somewhat lower prices. The market closes steady today.

SILVER AND STERLING EXCHANGE

Apr.	22	23	24	26	27	28
New York....	51½	52½	52½	52	52½	52½

Sterling Ex..	4.8760	4.8750	4.8745	4.8745	4.8735	4.8730

New York quotations, cents per ounce troy, fine silver; London, pence per ounce sterling silver, 0.925 fine.

Exports of silver from London to the East, reported by Messrs. Pixley & Abell, year to April 15:

	1908.	1909.	Changes.
India.....	£ 2,150,638	£1,176,400	D. £ 975,138
China..	506,400	963,200	I. 456,800
Straits.....	90,200	82,800	D. 7,400
Total.....	£ 2,747,138	£2,241,400	D. £ 505,738

Imports for the week, £5000 from Mexico and £295,000 from New York; total, £300,000. Exports, £47,000 to China and £25,000 to India; £72,000 in all.

Copper, Tin, Lead and Zinc

	Copper.				Tin.	Lead.		Zinc.
	Lake, per lb.	Electrolytic, Cts. per lb.	London, £ per ton.	Cts. per lb.		New York, Cts. per lb.	St. Louis, Cts. per lb.	St. Louis, Cts. per lb.
Apr.	12½	12½				4.20	4.10	4.92½
22	12½	12½	57	29½	4.25	4.15	4.94	4.92½
23	12½	12½	57½	29½	4.20	4.10	4.92½	4.92½
24	12½	12½		29½	4.20	4.10	4.92½	4.92½
25	12½	12½		29½	4.20	4.10	4.92½	4.92½
26	12½	12½	57½	29½	4.25	4.15	4.96	4.96
27	12½	12½	57½	29½	4.25	4.15	4.96	4.92½
28	12½	12½	57½	29½	4.20	4.10	4.92½	4.92½

London quotations are per long ton (2240 lb.) standard copper. The New York quotations for electrolytic copper are for cakes, ingots and wirebars, and represent the bulk of the transactions made with consumers, basis, New York, cash. The price of cathodes is usually 0.125c. below that of electrolytic. The quotations for lead represent wholesale transactions in the open market. The quotations on spelter are for ordinary Western brands; special brands command a premium.

Copper—During the week April 22-28 the market has remained very quiet. Some transactions of moderate volume have been made with European and domestic consumers. Lake copper was sold at 12½c. for good ordinary brands, while some special brands fetched 13c., and Calumet & Hecla is said to have realized a trifle more. Electrolytic copper has been freely offered at 12¾c., delivered, 30 days, equivalent to somewhat less than 12½c., cash, New York, even for delivery as late as August, and concessions were made to develop business. At the close the market is unchanged at 12½@13c. for Lake copper, and 12½@12¾c. for electrolytic, in ingots, cakes and wirebars. The average of the week for casting copper has been 12¾@12½ cents.

Copper sheets are 16½c. base for large lots. Full extras are charged, and higher prices—up to 18c.—for smaller quantities. Copper wire, 14½c. base, carload lots at mill. Business has been rather light.

The transactions in the London standard market at the beginning of the week were of considerable volume at somewhat higher quotations. The full advance, however, was not maintained, and the market closes steady at £57 7s. 6d. for spot, £58 2s. 6d. for three months.

Refined and manufactured sorts we quote: English tough, £62; best selected, £61@62; strong sheets, £73@75.

Exports of copper from New York and Philadelphia for the week, 5823 long tons. Our special correspondence gives the exports from Baltimore at 1988 tons copper.

Tin—The transactions on the London Metal Exchange have been of moderate volume, and the market remains exceedingly dull. This is somewhat surprising in view of the good consumption which is reported from this side. The close is cabled at £132 7s. 6d. for spot, £133 12s. 6d. for three months. In this market tin is offered at the close at 29¼ cents.

Lead—While the demand for this metal has somewhat relaxed, quotations nevertheless remain firm, and close at 4.10@4.15c. St. Louis, 4.20@4.25c. New York.

The London market has shown a hardening tendency and fair transactions are reported. The close is firm at £13 7s. 6d. for Spanish lead, £13 10s. for English lead.

The John Wahl Commission Company reports to us from St. Louis under date of April 28 as follows: Lead dull and trading of only a retail character. Common brands of Missouri lead obtainable at 4.12½c. and lightly salable at that price. Corroding brands of southwest Missouri lead worth 4.17½ cents.

Spelter—The demand for this metal seems to have been taken care of for the present, and the few orders which presented themselves were eagerly competed for. Prices show a declining tendency and close at 4.87½@4.92½c., St. Louis, 5.02½@5.07½c., New York.

No change is to be reported from the other side, and London quotations close steady at £21 12s. 6d. for good ordinaries, £21 17s. 6d. for specials.

New York quotations for spelter, April 22-24, inclusive, 5.07½@5.10c.; 26, 5.05@5.10c.; 27, 5.05@5.07½c.; 28, 5.02½@5.07½ cents.

Base price of sheet zinc is now 6¾c. per lb., f.o.b. La Salle-Peru, Ill., less 8 per cent. discount.

The John Wahl Commission Company reports to us from St. Louis under date of April 28 as follows: Spelter is a little lower, spot selling at 4.90c., and metal for May delivery at 4.92½c., East St. Louis.

Other Metals

Antimony—Business has fallen off again, and the market is quiet. Prices are unchanged at 8½c. for Cookson's; 8¼c. for Hallett's; 7½@8c. for U. S. and other brands.

Aluminum—No change is to be noted in business or prices. No. 1 ingots, 22@24c. base; wire 31@32c. and sheets 33@34c. base.

Quicksilver—Business is not particularly active. New York quotations are \$44.50 per flask of 75 lb. San Francisco, nominal at \$44 for domestic orders and \$42 for export. London, £8 7s. 6d. per flask, with £8 2s. 6d. named by jobbers.

Nickel—Large lots, contract business, 40¢@45¢. per lb. Retail, spot, from 50¢. for 2000-lb. lots up to 55¢. for 500-lb. lots. The price for electrolytic is 5¢. higher.

Cadmium—Current quotation 75¢. per lb., in 100-lb. lots, at Cleveland, Ohio.

Magnesium—Quotations for this metal are \$1.25 per lb., New York, in 100-lb. lots; for 5-lb. lots, \$1.40 per pound.

British Metal Imports and Exports

Imports and exports of metals in Great Britain, three months ended March 31, figures in long tons, except quicksilver, which is in pounds:

	Imports.	Exports.	Excess.
Copper.....	30,191	18,910	Imp. 11,281
Copper, 1908.....	34,205	18,508	Imp. 15,697
Tin.....	10,390	10,099	Imp. 291
Tin, 1908.....	11,374	10,159	Imp. 1,215
Lead.....	52,906	11,241	Imp. 41,664
Lead, 1908.....	52,285	14,379	Imp. 44,906
Spelter.....	27,417	1,564	Imp. 25,853
Spelter, 1908.....	24,697	1,723	Imp. 22,974
Quicksilver, lb.....	893,993	270,196	Imp. 623,797
Quicksilver, '08.....	878,056	572,690	Imp. 305,366

Ores:

Tin ore and con.....	5,137		Imp. 5,137
Tin ore, 1908.....	6,684		Imp. 6,684
Pyrites.....	206,547		Imp. 206,547
Pyrites, 1908.....	245,182		Imp. 245,182

Copper totals include metallic contents of ore and matte. Exports include re-exports of foreign material. Of the imports in 1909 the United States furnished 128 tons copper matte, 4859 tons fine copper and 8393 tons lead.

British Iron Trade—Exports and imports of iron and steel and their products in Great Britain for the three months ended March 31 are valued as below, in long tons:

	Exports.	Imports.	Excess.
Iron and steel £	8,914,419	£ 1,854,828	Ex. £ 7,059,591
Machinery ...	6,761,462	1,151,456	Ex. 5,610,007
New ships....	1,499,864		Ex. 1,499,864
Total.....	£17,175,745	£ 3,006,283	Ex. £14,169,462
Total, 1908....	19,953,214	3,128,834	Ex. 16,824,380

Decrease in exports this year, £2,777,469, or 13.9 per cent.; decrease in imports, £122,551, or 3.9 per cent. The quantities of iron and steel were, in long tons:

	1908.	1909.	Change.
Exports.....	999,250	931,403	D. 67,846
Imports.....	246,945	277,877	I. 30,932

The imports this year were in long tons of blooms, billets and other half-finished material.

British Iron Ore Imports—Imports of iron ore into Great Britain, three months ended March 31, were 1,402,510 long tons in 1908, and 1,363,012 in 1909; a decrease of 39,498 tons. Of the imports this year 1,052,175 tons were from Spain.

Zinc and Lead Ore Markets

Joplin, Mo., April 24—The highest price reported paid was \$43, the base price ranging from \$38 to \$41 per ton of 60 per cent. zinc for sulphide ore, and \$17 to \$19 per ton of 40 per cent. zinc for silicate ore. The average price, all grades, was

\$37.36, with a minimum of silicate sales. Lead ore is reported sold as high as \$58, 80 per cent. grades bringing \$57. The average price, all grades, is \$57.08 per ton.

With this week is ended four months of 1909, with an increase of 18,967 tons of zinc and 9760 tons of lead. The zinc value is a gain of \$772,433, the lead value a gain of \$272,621, and the total value is \$1,045,054 greater than the same period of last year. The shipment is an average of 5628 tons per week for each week of this year, against an average of 4514 each week last year.

Highland and Linden are not reported. In addition to the above there was shipped

to the American Zinc Ore Separating Company, 135,500 lb. and to the Joplin Separator Works, 225,000 lb. zinc concentrates.

Chemicals

New York, April 28—The market is quiet; most of the current deliveries are on yearly contracts.

Copper Sulphate—Prices remain unchanged at \$4.60 per 100 lb. for carload lots and \$4.85 per 100 lb. for smaller parcels. Sales have been moderate.

Arsenic—Current quotations for white arsenic are 27¢@3¢. per lb. Sales are improving slightly.

Nitrate of Soda—Current sales continue rather small. Prices remain unchanged at 21½¢. for spot nitrate and 21¼¢. for futures.

Mining Stocks

New York, April 28—The general stock market this week has been a good of a traders' market with many fluctuations, but perhaps no very definite tendency. It continues to show considerable strength, and though fluctuations have been in both directions, there is no apparent tendency to a decline. It must be said that the market seems to be ready to absorb all the stocks that were offered. Speculation has been helped by cheap money and also by the apparent disposition of the foreign markets to retain the stocks recently purchased here. The Turkish trouble has affected the London and Paris exchanges very much less than was expected.

On the Curb the copper stocks were a good deal in evidence and prices were fairly well held. Nevada Consolidated continued to be in demand. The one exception was North Butte, which was severely handled both here and on the Boston exchange and showed a sharp decline.

Cobalt stocks were in good demand and at fair prices. The Nevada gold stocks are rather reviving, more interest being taken in them, with consequent better buying.

Boston, April 27—A \$14.50 drop per share in the price of North Butte mining stock the past week has proved somewhat disastrous to the market and has undermined public sentiment. The reason for this sharp decline remains a mystery up to the present time. Undoubtedly there has been liquidation of large inside holdings of stock but the last 10 or 20 points on the down side were mainly the result of bear manipulation. From a high at \$85.25 made on Jan. 2 of the present year, the price reached \$52.50 today, representing a decline of \$32.75 or a depreciation of over 38,000,000 in the value of the property. On Monday alone the stock broke

\$9.25 per share which is enough to affect loans on the stock. The stock reached \$120 per share in 1907 and went as low as \$30 during the panic period of that year. A covering movement carried the stock up to \$56.50 at the close tonight. The one great criticism is that North Butte has paid out practically all that it has earned.

A bear attack on Copper Range brought the stock to \$73.50, which represents a decline of \$4.50 for the week. East Butte has suffered to the extent of almost \$3, touching \$13.25. A selling movement in Butte Coalition carried the price off \$1.62½ to \$22.50. Mass mining touched \$10, but closed off at \$8.75 tonight. Activity has been confined to a few stocks but declines have been general.

Amalgamated has been little affected by price movements in this market as its fluctuations have been dominated by the strength of the New York list.

Boston Stock Exchange members are somewhat upset over the likelihood of the removal of the exchange from State Street to a spot southerly in direction. State Street to Boston is the same as Wall Street is to New York and sentiment may insist upon remaining in the present location. The lease in the present quarters does not expire for two years yet.

Southwestern Development has been the Curb exchange feature. After selling up to \$1.06½ it broke to 17c, rallying subsequently to 35 cents. A bull campaign was spoiled by the slipping of either treasury or pooled stock.

THE MINING INDEX

The editors of this paper read all the important publications of the world that relate to mining and the treatment of minerals. This index is published as a reference for all interested and to make it impossible for readers of the *ENGINEERING AND MINING JOURNAL* to miss any important article published anywhere.

We will undertake to furnish a copy of any article (if in print) in the original language, for the price quoted. Where no price is quoted the cost is unknown. These papers are not kept in stock, but must be ordered from the publisher; hence there will be some delay for foreign papers.

No accounts can be opened for these small amounts, but remittance must be sent with order. For the convenience of those making small but frequent remittances, coupons are furnished at the following prices: 20 cents each, six for \$1.00, thirty-three for \$5.00 and one hundred for \$15.00. This arrangement will be especially appreciated by foreign readers and men in distant mining camps. Where remittances are made in even dollars we will return the excess over an order in coupons upon request.

ALUMINUM.

9117—ALUMINUM FROM CLAY, ETC.—Ueber Verwendbarkeit von Tonerde-silikaten zur Aluminiumfabrikation. Max Moldenhauer. (Metallurg., Jan. 8, 1909; 7½ pp.)

Results of experiments, including description of apparatus and methods, on the extraction of aluminum from silicates of the metal. 40c.

9118—WELDING—Autogenous Welding of Aluminum. M. U. Schoop. (Electrochem. and Met. Ind., April, 1909; 2 pp.)

Describes the requirements necessary for a thoroughly practical application of this method. Illustrated. 40c.

ASPHALTUM.

9119—FRANCE—Geological Occurrence and Mining of Asphalt in France. S. A. Ionides. (Min. Sci., April 1, 1909; 2 pp.)

A description of the methods used in mining, together with the uses of asphalt. Illustrated. 20c.

CALCIUM CARBIDE.

9120—MANUFACTURE OF Calcium Carbide. (Engineering, March 26, 1909; 3½ pp.)

The author describes the calcium carbide factory at Odda, Norway, and gives a detailed account of the electric power plant which develops 23,000 electrical horse-power. To be continued. 40c.

CARBORUNDUM.

9121—MANUFACTURE OF Modern Grinding Wheels. (Am. Machinist, Apr. 1, 1909; 4 pp.)

An outline of the process by which carborundum is made, and how it passes from crystals into complete grinding wheels. Also some notes on testing. Illustrated. 20c.

CEMENT.

9122—PORTLAND CEMENT for Use in the Tropics. R. K. Meade. (Eng. News, April 8, 1909; 3 pp.)

The author gives analyses and descriptions of a number of representative American cements. Also some notes on the use of American cement in Central and South America and the Philippines. 20c.

9123—PORTLAND CEMENT—The Manufacture of Portland Cement. W. M. Kinney. (Proc. Eng. Soc. Western Penn., March, 1909; 32 pp.)

The author gives an historical review of the cement industry with descriptions of the principal processes and machinery that are employed today in the cement industry. Illustrated. 40c.

COAL AND COKE.

9124—CANADA—The Mining Operations of the Dominion Coal Company. F. W. Gray. (Can. Min. Journ., Mar. 15, 1909; 5½ pp.)

This installment describes the Emery seam and the lower seams of the Glace Bay basin. Map and illustrations. 20c.

9125—COAL SAMPLING and Analysis. N. W. Lord. (Eng. News, April 8, 1909; 1 p.)

Some notes on the benefits derived from the analysis of fuel coal. Also a description of some of the laboratory methods. 20c.

9126—COKE—Etude sur la Fabrication du Coke en récolte et le traitement des sous produits de la distillation de la houille. A. Say. (Bull. Soc. de l'Ind. Minérale, Mar.

1909; 39 pp.) Continuation of article previously indexed.

9127—COKE—Washed Coal for Coke Making. Walter J. May. (Pract. Engr., Mar. 12, 1909; 1 p.)

Discusses the utility for washed coal in the coke industry describing briefly a method of operation. 20c.

9128—COKE-OVEN CONSTRUCTION—Progress in By-Product Coke-Oven Construction at Indianapolis. C. G. Atwater. (Prog. App. Min., Apr. 15, 1909; 2½ pp.)

An illustrated article describing the work on the plant of Citizens' Gas Company at Indianapolis, Ind. 40c.

9129—COKE-OVENS—The Base Contained in the Tar from Otto-Hilgenstock Coke-Ovens. F. G. Trobridge. (Journ. Soc. Chem. Ind., Mar. 15, 1909; 2 pp.)

A chemical discussion of the conditions of distillation in retort coke-ovens as compared to those in gas retorts.

9130—COKING PLANT at the Midland Coal, Coke and Iron Company, Ltd., Apedale, Staffs. (Iron and Coal Tr. Rev., Mar. 19, 1909; 1½ pp.)

A general description of the Midland Coal, Coke & Iron Co.'s Plant, at Apedale, which is equipped with ovens manufactured by Messrs. Simons-Carves of Manchester. Illustrated. 40c.

9131—COLLIERY EQUIPMENT—Bentley Colliery. (Iron and Coal Tr. Rev., Mar. 12, 1909; 1½ pp.)

A description dealing in particular with the mechanical equipment of the plant, with illustrations and plans. 40c.

9132—COLLIERY EQUIPMENT—Gas and Electric Plants at Collieries. (Iron and Coal Tr. Rev., Mar. 5, 1909; 1½ pp.)

This paper read before Nat. Assn. Coll. Mgrs. deals largely with the electric power generation and coking plants at the Powell Duffryn colliery, and a number of other important plants. 40c.

9133—CONVEYING—A New Departure in the Hauling of Coal at the Working Face. (Iron and Coal Tr. Rev., Mar. 12, 1909; 1½ pp.)

Describes conveying appliances to be placed in front of the working face and shows how they favor the rapid and economic handling of the coal. Plans. 40c.

9134—DIAMOND DRILLING—The Cost of Diamond Drilling for Coal in Pennsylvania. E. E. White. (Eng. and Min. Journ., Mar. 27, 1909; 1 p.)

Tables are given showing the cost per foot, the kind of rock and the actual rate at which the boring was accomplished. 20c.

9135—EXPLOSIONS—Remarks on Some Recent Explosions in Coal Mines. C. J. Coll. (Journ. Min. Soc. of Nova Scotia, Vol. XIII, 1908; 1 p.)

The author gives notes on some of the recent coal mine explosions, together with remarks on explosives, open lights, electric mining machinery, coal dust, fire damp, and suggestions for the prevention of coal mine explosions.

9136—EXPLOSIONS—Report of the Glen-coe Colliery Inquiry Commission. (Natal Govt. Gazette, Dec. 22, 1908; 20 pp.)

Gives the results of the investigation made by the Government commissioners of Natal with particular reference to the causes of and responsibilities for the explosions, and an outline of the precautions to be taken in similar cases. 60c.

9137—EXPLOSIONS—The Work of the Foreign Mining Explosion Stations. Geo. S.

Rice. (Black Diamond, April 3, 1909; 3 pp.) The author discusses certain experiments which have been performed to determine the action of explosives and to ascertain under what conditions coal dust is most dangerous in a mine. Illustrated. 20c.

9138—MACHINE MINING—Mining Coal with Machines in England. George R. Dixon. (Eng. and Min. Journ., Apr. 17, 1908; 3½ pp.)

The author discusses the use of coal mining machinery, the quantity of coal produced, and a comparison of costs with hand labor. Illustrated. 20c.

9139—MINING METHODS—Pocahontas Region Mining Methods. H. H. Stock. (Mines and Minerals, Apr. 1909; 6½ pp.)

A short geological description of the district, together with methods recommended for developing the mines. Also gives the names of the land holding companies which are operating mines in this section of the State. Illustrated. 20c.

9140—MINING METHODS—The Best Methods of Working Seams of Coal in Step Measures. H. A. Staplen. (Coll. Guardian, Mar. 19, 1909; 1½ pp.)

A close study of the economic phase of the question. Describes and illustrates by line drawings the various methods. To be continued. 40c.

9141—MONTANA—Geology of the Great Falls Coal Field, Montana. Cassius A. Fisher. (U. S. Geol. Surv., Bull. No. 356, 1909; 85 pp.)

A report, fully illustrated with maps, geological sections and photographs describing the rock formations; indicating their character, distribution, structure and stratigraphic relations and also embodying a brief statement of mineral resources other than coal.

9142—NEW MEXICO—Report of the Mine Inspector for the Territory of New Mexico to the Secretary of the Interior for the Fiscal Year Ended June 30, 1908. J. E. Sheridan. (Washington, 1908; Government Printing Office; 48 pp.)

A detailed report with statistics on the coal mining industry of New Mexico.

9143—NEW ZEALAND—Methods of Mining Coal in New Zealand. Sidney Fry. (Eng. and Min. Journ., Apr. 10, 1909; 3 pp.)

Gives some notes on the location, and geology of the district, together with a detailed description of the Westport-Stockton colliery in which the equipment is similar to that used in the United States. Illustrated. 20c.

9144—PEAT RESOURCES of the United States. Charles A. Davis. (Eng. Mag., April, 1909; 10 pp.)

Treats of the economics of the use of peat as a fuel. 40c.

9145—PHILIPPINE COALS as Fuel. Alvin J. Cox. (Philippine Journ. Sci., Nov., 1908; 53 pp.)

Results of a thorough practical investigation of the steam-making capacity of Philippine coals. Illustrated with 13 plates. 40c.

9146—RESCUE WORK—Recent Advances in Means of Saving Life in Coal Mines. Henry Cunningham. (Paper before Royal Inst. of Great Britain, Feb. 19, 1909; 16 pp.)

A historical résumé of conditions in British coal mines emphasizing the recent advance in knowledge of the causes of explosions in mines and the way miners meet death. Describes life saving apparatus.

9147—SHAFT SINKING—Collar at No. 1 Allan Shaft, Stellarton, N. S. H. E. Coll. (Journ. Min. Soc. of Nova Scotia, Vol. XIII, 1908; 6 pp.)

A description of the method of sinking a shaft through a considerable thickness of

water-bearing sand and clay before reaching bed-rock.

9148—SHAFT SINKING Operations at Wellesley New Fitting, Wemyss Collieries, G. D. Budge and P. Dunsire, (Trans. Min. Inst. of Scotland, Dec. 10, 1908; 7 pp.)
The author describes the method adopted to pierce the new shaft upward from four different levels and gives notes on the method of excavating the ground, blasting, walling, hoisting and ventilation.

9149—SHAFT—Concrete Lined Mine Shaft at Hubert, Penn. (Eng. News, Apr. 8, 1909; 1½ pp.)

A very complete description of the method of sinking and lining a shaft at the property of the Frick Coal Company. Detailed drawings are given showing the methods used.

9150—SURVEYING—Modern Practice in Surveying, T. A. O'Donohue, (Min. Engineering, April, 1909; 2 pp.)

The author gives a description of Harrison's clinograph, together with methods used for accurate measurements. To be continued. Illustrated. 20c.

9151—TESTING—Comparative Tests of Coal, P. H. Bullock, (Power, Mar. 16, 1909; 1½ pp.)

Describes testing apparatus and method of making test, discussing the factors entering into such investigations. 20c.

9152—VENTILATION—Data on Coal Mine Ventilation, (Eng. and Min. Journ., Apr. 10, 1909; ¾ p.)

A short discussion of the advantages of small high-speed fans with details of their construction. 20c.

COPPER.

9153—ARIZONA—Geology of Globe, Leon and J. Sawyer, (Los Angeles Min. Rev., Mar. 13, 1909; 1 p.)

Discussion and descriptive data of vertical and geological cross sections. 20c.

9154—ARIZONA—The Copper State, J. H. McClintock, (Los Angeles Min. Rev., Mar. 27, 1909; 3 pp.)

The author gives an historical sketch of Arizona with short descriptions of some of the principal mines, among which are the Copper Queen, Calumet and Arizona, United Verde and the Old Dominion. Illustrated. 20c.

9155—ARIZONA—The Imperial Copper Co.'s Mines, Arizona, S. F. Shaw, (Min. Wld., Apr. 3, 1909; 1½ pp.)
The author gives a few notes on the geology and the ore deposits of this mine. He also gives the flow sheet of the mill which handles porphyry ores. Illustrations. 20c.

9156—BRITISH COLUMBIA—Mining on the Queen Charlotte Islands, B. C. J. F. Bledsoe, (Min. Wld., Mar. 20, 1909; 2½ pp.)

A discussion of the mining condition on a group of islands about 80 miles off shore from Prince Rupert. Describes the mining operations. Illustrated. 20c.

9157—CANADIAN CONSOLIDATED COPPER COMPANY IN 1908, L. D. Ricketts, (Eng. and Min. Journ., Apr. 3, 1909; 4½ pp.)

This article is essentially the annual report of the company which gives a detailed statement of the mining operations and costs in all the departments. Also a description of the bedding system which has been installed. 20c.

9158—CONVERTER—The Yampa Smelting Company's 1000-Ton Converter, Chas. C. Christensen, (Min. Wld., Apr. 3, 1909; 3 pp.)
The author gives a description of the smelter and the mechanical equipment of the power plant and its operations. Illustrated. 20c.

9159—ELECTROLYSIS—Ein Beitrag, Zur Kenntnis Der Elektrolyse Von Kupferlösungen, Jean Meyer, (Zeit. f. Elektrochem., Feb. 1, 1909; ½ p.)
A study of the electrolysis of copper solutions, as affected by temperature, concentration, and other factors. 40c.

9160—MILLING PRACTICE at the Consolidated Mercur, Leroy A. Palmer, (Salt Lake Min. Rev., Mar. 15, 1909; 3 pp.)
The author gives a description of the mill and the treatment practice showing how it has been evolved to meet the difficulties encountered. Illustrated. 20c.

9161—ORE REDUCTION at the Telemark Copper Mine, Norway, W. E. Bennett, (Min. Journ., Mar. 13, 1909; 1½ pp.)
Describes the recently erected concentration plant giving flow sheet, elevation and photographs. 40c.

9162—PRODUCTION AND PROSPECTS in the Copper-Mining Industry, Arthur S. Brown, (Eng. Mag., March, 1909; 8 pp.)

Gives statistics on world's copper production, and deals in particular with copper mining in the United States. 40c.

9163—SAMPLING Native Copper Deposits, Harley E. Hooper, (Aust. Min. Stand., Feb. 3, 1909; ½ p.)

Gives details of the method evolved by the author for accomplishing that which is usually considered practically an impossibility. 40c.

9164—SULPHATE ELECTROLYSIS — Bemærkninger Betreffs Der Elektrolyse Von Kupfersulfatlösungen, E. Boerster, (Zeit. f. Elektrochem., Feb. 1, 1909; 3 pp.)

A study of the electrolysis of copper sulphate solution, as affected by various factors. 40c.

FELDSPAR.

9165—ONTARIO—Feldspar Mining in Ontario, Cajetan Morsack, (Eng. and Min. Journ., Apr. 10, 1909; 1 p.)

Describes the feldspar deposits, the methods of mining, transportation and costs. Illustrated. 20c.

GOLD AND SILVER.

9166—ARIZONA—Mining and Milling in Tombstone District, Arizona, S. F. Shaw, (Min. Wld., Mar. 27, 1909; 2 pp.)

The author gives a short historical review of the district, together with notes on the plans of the Tombstone Consolidated Mines Company. Illustrated. 20c.

9167—COLOMBIA—Mining Industry of Antioquia, Colombia, S. A.—I and II, Silas H. Wright, (Min. Wld., Mar. 20 and 27, 1909; 9 pp.)

Describes the geology of the region and the conditions bearing upon the mining industry. Gives some details of cost of operation. Illustrated. 40c.

9168—CYANIDATION—Chemistry of the Bromo-Cyanogen Process, S. H. Worrell, (Min. and Sci. Press, Mar. 6, 1909; 1 p.)
A summary of the chemical equations advanced by various investigators. 20c.

9169—CYANIDE LIXIVIATION by Agitation, Walter M. Brodie, (Eng. and Min. Journ., Apr. 3, 1909; 1 p.)

A description of the Pachuca tank with improvements that have been made, by means of which it is possible to keep the slimes thoroughly agitated. Illustrated. 20c.

9170—CYANIDING Black Hills "Blue Ores," B. D. O'Brien, (Mines and Minerals, April, 1909; 4½ pp.)

The author gives experiments in grinding to different degrees of fineness, roasting and then cyaniding gold with cyanide and other chemical treatments. The article contains tabulated results from a number of different mills in the Black Hills district. Illustrated. 20c.

9171—DREDGING — Electricity in Gold Dredging Operations in Montana, Floyd Bushnell, (Min. Sci., Mar. 4, 1909; 2½ pp.)
Tells of the operation of the Conrey Placer Mining Company near Ruby, Madison Co., Mont. and a substitution of electricity for steam power. Illustrated. 20c.

9172—DREDGING—Les Récents Perfectionnements Des Dragages Aurifères dans le Monde, L. Delvaux, (Bull. Soc. des Ing. Civ. de France, Feb. 1908; 53 pp.)
Describes the construction and equipment of gold dredges, with notes on their operation, particularly in the Galanas.

9173—FRANCE — The Three Producing Gold Mines of France, E. Walch, (Eng. and Min. Journ., Apr. 17, 1909; 2 pp.)

A short description of the mining and metallurgical methods of the Chatelet, Lucette and the Bellière companies and the recovery of antimony as a by-product. 20c.

9174—INDIA — Goldberghau in South Mahratta, Insbesondere die Goldfelder zu Dhavar in Vordorindien, E. Reuning, (Zeit. f. prak. Geol., Nov., 1908; 5 pp.)
Describes the geology of the Indian gold fields with brief notes on the mines. 40c.

9175—MEXICO—A Trip Through Northern Durango, C. N. Nelson, (Eng. and Min. Journ., Apr. 3, 1909; 1½ pp.)

The author gives short descriptions of a number of the principal mining camps in the Inde district, El Oro, Guanaecvi and Rosario. Illustrated. 20c.

9176—MEXICO—Some Mexican Mining Results, A. S. Atkinson, (Min. Wld., Apr. 3, 1909; 1 p.)

The author gives a brief review of the mining and metallurgical industries in a number of the principal mining districts of Mexico for the year 1908. Special reference is given to cyaniding. 20c.

9177—MILLING AND CYANIDING PRACTICE at EL Oro, Mexico, Claude T. Rice, (Eng. and Min. Journ., Apr. 3, 1909; 7½ pp.)

The author gives details of practice as employed at the El Oro Company's mills, the Mexico mill, the Dos Estrellas mill and the Cedro mill. The treatment of slimes is an important feature in this article. Illustrated. 20c.

9178—MOUNT MORGAN Gold and Copper Mine, Gerard W. Williams, (Eng. and Min. Journ., Mar. 27, 1909; 4 pp.)

A description of the mining methods which consist of steam shovel, the milling system and square sets. Also a short description of the ore deposits. Illustrated. 20c.

9179—MOUNT MORGAN METALLURGICAL WORKS, Gerard W. Williams, (Eng. and Min. Journ., Apr. 17, 1909; 4 pp.)

A discussion and comparison of three methods of treating ore—chlorination, chlorination after roasting and smelting; a description of the plant for each method, with notes on the recovery and costs. Illustrated. 20c.

9180—MOUNT MORGAN MINE, Central Queensland, J. Bowle Wilson, (Eng. and Min. Journ., Apr. 10, 1909; 6 pp.)

A short description of the surrounding country, the water supply, the ore deposits, methods of mining, stoping, shaft sinking and labor conditions. Illustrated. 20c.

9181—NOVA SCOTIA—How Can the Gold Mining Industry of Nova Scotia be Assisted, E. P. Brown, (Journ. Min. Soc. of Nova Scotia, Vol. XIII, 1908; 12 pp.)

Some notes and discussion of the Government's willingness to assist mining operators who will undertake deep mines.

9182—NOVA SCOTIA—Notes on Geological Structure at the Richardson Mine as Shown by Plans and Models of the Same, E. P. Brown, (Journ. Min. Soc. of Nova Scotia, Vol. XIII, 1908; 16 pp.)

The author gives these notes on the geology of the district so that they may be recorded and helpful to others interested in the mineral development of the province. Illustrated.

9183—ORE HANDLING—Methods of Ore Handling at the Richardson Mine, Guysborough County, Nova Scotia, H. S. Badger, (Journ. Min. Soc. of Nova Scotia, Vol. XIII, 1908; 20 pp.)

Discusses the method of ore handling from the standpoint of a mine superintendent or mine operator. Photographs are given of a cluster of paris mode showing the Richardson mine and the methods of handling ore underground.

9184—ORE TREATMENT at the Giant Mine, Hartley District, Rhodesia, R. C. H. Cooke, (Min. Journ., Mar. 20, 1909; 1½ pp.)

A general outline of the treatment employed, which consists of stamps, fine grinding, tube mills with close concentration on blankets and canvas tables. Illustrated. 40c.

9185—RAND MINES—Amalgamation of Four Large Rand Producers, Ralph Stokes, (Min. Wld., Apr. 3, 1909; 1½ pp.)

The author gives an account of the amalgamation of the Crown Reef, Crown Deep, Long Langlaats Deep and Robinson Central Deep. Illustrated. 20c.

9186—WASHINGTON—The Palmer Mountain Tunnel and Power Company, John Boyd, (Min. Wld., Mar. 20, 1909; 1½ pp.)

A description of the new 100-stamp mill situated in Okanogan county, Washington. Illustrations and flow sheet. 20c.

9187—WESTERN AUSTRALIA — Bonnievale and Kumanallang Districts, Coolgardie Goldfield, Charles G. Gibson, (Bull. No. 31, W. A. Geol. Surv., 1908; 222 pp.)

This publication contains geological notes on the Bonnievale and Kumanallang Districts, Coolgardie, and the Black Range district of East Murchison Goldfield, together with maps and illustrations.

9188—WESTERN AUSTRALIA — East Murchison Goldfield, Western Australia, Charles G. Gibson and A. Montgomery, (Aust. Min. Stand., Feb. 10, 1909; 2 pp.)
An article descriptive of the prospects of Wiluna and other centers, with a sketch map. 40c.

9189—WESTERN AUSTRALIA — Report Upon the Auriferous Deposits of Barramble and Errols (Cue District) and Gum Creek (Nannine District) in the Murchison Goldfield, also Wiluna (Lawlers District) in the East Murchison Goldfield, Charles G. Gibson, (Western Australia Geol. Surv., Bull. No. 34, 1908; 43 pp.)

A complete discussion of the conditions prevailing in these districts, with illustrations and maps.

IRON AND STEEL.

9190—AIR-FURNACE PROCESS OF Pre-

paring White Cast-Iron for the Malleabilizing Process. Henry M. Howe and Enrique Paudco. (Paper before A. I. M. E., Oct., 1908; 10 pp.)

A paper giving the composition of the iron and slag at different stages in the "air-furnace" process, and particularly the method for conversion into malleable cast iron by annealing. Tables.

9191—ANALYSIS—Methods for the Determination of Iron in Ores. R. K. Meade. (Min. Wld., Mar. 27, 1909; 3½ pp.)

Describes the methods used for standardizing solutions and also gives notes on the comparison of standards. He discusses Marguerite's and Penny's methods for determining iron in ore; also the Lake Superior method. Illustrated. 20c.

9192—BASIC BESSEMER PROCESS, The. (Iron Age, Mar. 18, 1909; 3 pp.)

An exhaustive chemical investigation by German engineers. Notes on the metallographic examination of pig iron, and the composition of converter gases. Also some notes on the heat economy of the bessemer process. Illustrated. 20c.

9193—BASIC STEEL PLANT—La Nouvelle Acierie Thomas des Usines metalurgiques de Burchard (Prusse rhénane). (Génie Civil, Jan. 2, 1909; 6 pp.)

Describes the design and equipment of this modern steel plant, and gives details of some parts of its machinery. 40c.

9194—BLAST FURNACE CHARGERS. (Iron and Coal Tr. Rev., Mar. 12, 1909; 2 pp.)

Describes and gives photographs of recently perfected device. Detailed line drawings of some of the recent chargers are given. 40c.

9195—BLAST FURNACE CHARGING—Charging Mechanism for Blast Furnaces. (Mech. Engr., Mar. 12, 1909; 1½ pp.)

Discusses in detail and gives plans of arrangements used in various methods of charging. 20c.

9196—BLAST FURNACE GAS—The Development of Blast-Furnace Gas Purifying. C. Flossel. (Iron and Coal Tr. Rev., Mar. 12, 1909; ¾ pp.)

This article gives an historical review of the development of the process of purifying gases from blast furnaces. Illustrated. 40c.

9197—BLAST FURNACE PRACTICE—Blast-Pressure at the Tuyeres and Inside the Furnace. R. H. Sweetser. (Paper before A. I. M. E., Feb. 1909; 6 pp.)

The author sets forth a number of personal observations and gives details of test performed, with a drawing of the U-gage used for determining differences in pressure. 40c.

9198—CALIFORNIA—An Iron Deposit in the California Desert Region. Charles C. Jones. (Eng. and Min. Journ., Apr. 17, 1909; 3½ pp.)

The author gives a description of the geology of the district with some notes on the iron ore deposits together with their commercial value. Illustrated. 20c.

9199—CARBON TUNGSTEN STEELS—Researches of the Magnetic Properties of a Series of Carbon Tungsten Steels. T. Swiden. (Electrician, Mar. 12, 1909; 2 pp.)

Summarizes the relevant results of past workers and describes the continuation of an investigation of the properties of a series of constant-tungsten increasing-carbon steels. Diagrams. 40c.

9200—COST OF PIG IRON MADE FROM Lake Superior Ores. J. R. Fisher. (Eng. and Min. Journ., Apr. 10, 1909; 7 pp.)

The author bases this article on the operations of the Steel Corporation and gives detailed statements as to general costs, the capital employed at iron mines and furnaces, together with notes on open cut vs. underground mining. Illustrated. 20c.

9201—DRY AIR BLAST—Modern Commercial Uses of Refrigeration. (Ice and Cold Storage, Mar. 1909; ¾ pp.)

Describes the application of refrigeration in the Gayley dry blast. 40c.

9202—ELECTRIC FURNACE—Melting in the Induction Furnace. (Iron Tr. Rev., Mar. 25, 1909; 3½ pp.)

This article sets forth the results of experiments performed by the American Electric Furnace Company at Niagara Falls and gives plans and sections of the furnaces. 20c.

9203—ELECTRIC POWER—Electric Main Drives in German Mills—III. Eugene Elchel. (Iron Tr. Rev., Mar. 11, 1909; 1½ pp.)

A discussion of the features attending the development of the electric drive, treating in particular the driving end. Illustrated. Continuation of article previously indexed. 20c.

9204—ELECTRIC SMELTING—Reduction of Iron Ore in the Electric Furnace. (Elec-

trochem. and Met. Ind., April, 1909; 1½ pp.)

Sets forth the results of investigations of the possibilities of the electric furnace for iron ore reduction in comparison with the blast furnace. Abstract of paper by G. Cautal in *Stahl und Eisen*, Feb. 21, 1909. 40c.

9205—ELECTRIC SMELTING—The Production of Pig Iron at the Electric Furnace and the Industrial Utilization of Pyrite Residue. F. E. Carcano. (Electrochem. and Met. Ind., April, 1909; 1½ pp.)

Describes experiments carried on in Lombardy, Italy, in which pyrite residue containing 50 to 52 per cent. of metallic iron and about 2 per cent. of sulphur, was utilized in the electric furnace to produce pig iron. Gives data of costs. 40c.

9206—GAS PRODUCERS—The Construction and Management of Gas Producers for Open-Hearth Steel Works. C. Canaris. (Iron and Coal Tr. Rev., Mar. 12, 1909; 2½ pp.)

The author states the most important points bearing upon the proper construction and correct management of gas installations. 40c.

9207—INDIA as an Iron Producer—I and II. (Engineer, Mar. 12 and 19, 1909; 2 pp.)

Review early conditions in the iron industry of India which at one time was among the largest producers of the world. Describes the various improvements and extensions of the foundries of India recently completed. 60c.

9208—JAPAN—Iron Industry in Japan. (Iron Tr. Rev., Apr. 1, 1909; 1½ pp.)

Short notes on the production of the three great iron mines in Japan. Statistics on the importance of iron. Also a description of the Imperial Steel Works of the Japanese Government. 20c.

9209—LAPLAND—Les Gisements de Minerai de Fer de la Lapoine Suédoise. P. Nicou. (Ann. des Mines, Tome XIV, 9 livr., 1908; 116 pp.)

Describes the nature and occurrence of iron ores in Lapland, with notes on the methods of mining, transporting and treating them, and statistical data. To be continued.

9210—MALLEABLE CASTINGS—Production of Malleable Castings—XIII. Richard Moldenke. (Foundry, April, 1909; 2 pp.)

A further discussion of the malleable annealing process, together with interesting experiments conducted to ascertain the action of the heat treatment. 20c.

9211—MANGANESE IN STEEL—Beitrag Zum Einfluss des Mangans auf das System Eisen-Kohlenstoff. F. Wüst. (Metallurgie, Jan. 8, 1909; 18 pp.)

Results of an exhaustive study, including bibliography, of the influence of varying amounts of manganese on iron-carbon alloys of various compositions. 40c.

9212—MANGANESE STEEL. W. S. Potter. (Iron Tr. Rev., Mar. 25, 1909; 3 pp.)

A discussion of the physical properties and metallurgical practice of the manufacture of manganese steel. Abstract of paper before the Western Society of Engineers. 20c.

9213—NEW YORK—The Clinton Ores of New York State. D. H. Newland. (Paper before A. I. M. E., Oct., 1908; 19 pp.)

A geological description summarizing the more important economic features of the Clinton formation in New York; with full page illustrations and microphotographs.

9214—PERMEABILITIES AND RELUCTIVITIES for Very Wide Ranges of Excitation of Normal Specimens of Compressed Steel, Bessemer Steel and Norway Iron Rods. B. Osgood Peirce. (Am. Journ. Sci., April, 1909; 16 pp.)

This paper describes a long series of determining of permeabilities of standard compressed steel, bessemer steel, and Norway iron over a wide range of excitation, in order to determine the magnetic behavior. Illustrated. 60c.

9215—ROLLING MILLS—Bericht über die Arbeiten der Kommission zur Ermittlung der Kraftbedürfnisse an Walzwerken. II. Ortman. (Stahl u. Eisen, Jan. 6, 1909; 27 pp.)

Describes method employed, and gives complete results of a long series of experiments on the power consumption of rolls while working on a great variety of shapes. 40c.

9216—SPECIAL STEELS—The Nature and Characteristics of the New Steels. O. M. Ricker. (Eng. Mag., March, 1909; 12 pp.)

Second and concluding article on the subject, discussing the effect of alloy metals on the properties of steel. A complete review of the subject. 40c.

9217—STEEL PLANT—The Works of the Indiana Steel Co.—III. (Iron Tr. Rev., Apr. 1, 1909; 15 pp.)

This article describes the open-hearth plant, the soaking pits, and the roll mill of the

Steel Corporation's plant at Gary, Ind. Illustrated. 20c.

9218—STEEL RAILS—Recent Position of the Steel Rail Question. (Eng. and Min. Journ., Apr. 10, 1909; 1½ pp.)

A discussion of the specifications for steel rails based upon chemical requirements. In this article statistics are given from the specifications of the Pennsylvania, Baltimore & Ohio, Canadian Pacific and Santa Fe railroads. 20c.

9219—UNITED STATES STEEL CORPORATION. (Eng. and Min. Journ., Mar. 27, 1909; 2½ pp.)

Abstract of annual report for 1908. Gives the general balance sheet, capital expenditures, income account, production, domestic and foreign trade, productive capacity and some notes on the general improvements made by the company. 20c.

9220—VANADIUM—Some Good Results Obtained by Adding Vanadium to Steel. (Am. Machinist, Mar. 11, 1909; 2½ pp.)

Describes in particular the advantageous use of vanadium in the hand saws and cast pistons. Illustrated. 20c.

LIMESTONE.

9221—CONNECTICUT—The Sources of Limestone in Connecticut. E. H. Jenkins and E. M. East. (Conn. Agr. Expt. Sta., Bull. 163, Feb., 1909; 18 pp.)

Treats of its sources, composition and prices, with notes on its action in the soil.

NICKEL AND COBALT.

9222—ANALYTICAL METHOD—Nuevo Procedimiento para el Dosaje del Niquel en Presencia del Cobalto. Juan A. Sánchez. (Anales de la Sociedad Científica Argentina, Oct., 1908; 9 pp.)

Describes a method for separating and determining cobalt and nickel in common solution by means of potassium cyanide.

PETROLEUM

9223—DISTILLATION—The "Liming" of Crude Oil Before Distillation. A. P. Lidoff. (Petrol. Rev., Mar. 27, 1909; 2 pp.)

The author describes the process of liming and points out the advantages to be derived therefrom. 40c.

9224—JAPAN—On the Properties of Japanese Petroleum. K. Kobayashi. (Cal. Derrick, Feb. 1909; 3½ pp.)

Describes and gives results of tests upon Japanese petroleum, and compares them with Baku, Pennsylvania and Texas oils. Illustrated by map. 20c.

9225—MEXICO—The Petroleum Industry of Mexico During 1908. (Petrol. Rev., Mar. 13, 1909; 1¼ pp.)

First installment of an article reviewing the events of importance in the industry. 40c.

PRECIOUS STONES.

9226—DIAMONDS—Kimberlite Rock and the Origin of Diamonds. F. W. Volt. (Eng. and Min. Journ., Apr. 17, 1909; 2½ pp.)

The author gives a general classification of the diamond-bearing rocks together with notes on the origin of the diamond. 20c.

9227—DIAMONDS—The Copeton Diamonds—New South Wales.—II. R. Pike. (Aust. Min. Stand., Feb. 3, 1909; 1 p.)

Concludes the geological discussion of the occurrence of diamonds in matrix, and notes on the alluvial deposits. 40c.

RARE METALS.

9228—COLORADO—Welfare of Colorado's Rare Metal Industry. Herman Fleck. (Bull. Colo. Sch. Mines, Jan. 1909; 9 pp.)

A review touching on the metallurgy of the rare metals. Describes the pitchblende deposits of Gilpin county, and the vanadium deposits of Placerville. 60c.

9229—VANADIUM DEPOSITS in Peru. D. Foster Sweetser. (Paper before A. I. M. E., Feb. 1909; 26 pp.)

An article descriptive of the two districts in which deposits of vanadium have been found and considering the results of laboratory work performed to determine the nature of the deposits. Illustrated with maps, geological sections, sketches and photographs of the deposits and microphotographs of the ore.

TIN.

9230—BOLIVIA—Present Position of Bolivian Tin Mines. G. E. Brown. (Min. Journ., Mar. 27, 1909; 4 pp.)

A few notes on the cost of mining, smelt-

ing, and the names of a few of the principal mines operating in Bolivia. 40c.

9231—BRITISH EMPIRE'S TIN OUTPUT. (Min. Journ., Mar. 20, 1909; 1 p.)

Statistics showing the output of tin from 1893 to 1907 in tonnage and value. These statistics cover the United Kingdom and all of the English colonies. 40c.

9232—DETINNING INDUSTRY. The (Iron and Coal Tr. Rev., Mar. 19, 1909; 2 pp.)

A review of the detinning industry with notes on chlorine detinning and also a short note on the Goldschmidt Company. Illustrated. 40c.

9233—ORIGIN OF TIN DEPOSITS. J. B. Scrivenor. (Min. Journ., Mar. 6 and 13, 1909; 1½ pp.)

Discusses the classification of minerals, recently advanced by W. H. Emmons and in particular the genesis of tin deposits as illuminated by work performed on the Malay peninsula. 60c.

ZINC.

9234—ELECTROLYTIC EXTRACTION—Sulla possibile estrazione elettrolitica dello zinco e sua sostituzione al forno fusorio dei lavatori meccanici. (Rassegna Mineraria, Oct. 1, 1908; 2½ pp.)

Discusses some of the attempts to extract zinc from its ores electrolytically instead of by furnace treatment. 40c.

9235—ELECTROTHERMIC REDUCTION OF ZINC OF C. E. Lecher. (Bull. Colo. Sch. Mines, Jan., 1909; 25 pp.)

A discussion dealing with the mechanical and metallurgical phases of the electric smelting of zinc ores, carefully into details and gives complete data of experiments performed. Illustrated. 60c.

ECONOMIC GEOLOGY—GENERAL.

9236—ARKANSAS—Mineral Resources of Arkansas. A. W. Estes. (Proc. Am. Min. Congress, Dec., 1908; 5 pp.)

The author discusses in a general way zinc, lead, coal, hematite, marble and diamond deposits of the State with reference to their commercial value.

9237—CALIFORNIA—Stratigraphy and Paleontology of the San Pablo Formation in Middle California. Charles E. Weaver. (Univ. Cal. Pub., Vol. V, No. 16, Jan., 1909; 26 pp.)

A discussion setting forth the relation of the San Pablo formation to the other California tertiary horizons.

9238—DEFINITION OF ORE—What is an Ore? James F. Veins. (Min. and Sci. Press, Mar. 20, 1909; 4½ pp.)

The recapitulation of the definitions found in various authorities with Prof. Kemp's own idea upon the subject. 20c.

9239—FAULTING—Intersection, Faulting and Movement of Veins. Arthur Lakes. (Min. Sci., Apr. 1, 1909; 1½ pp.)

The author describes in a few words the faulting as observed in a number of principal mining districts of the world. Illustrated. 20c.

9240—MEXICO—Geology of the Guanajuato District, Mexico. C. W. Botford. (Eng. and Min. Journ., Apr. 3, 1909; 3 pp.)

A discussion of the various geological formations, the ore deposits and the various faulting systems. Illustrated. 20c.

9241—MINERAL COLLECTION—Notes on Various Minerals in the Field Columbian Museum Collection. O. C. Farrington and E. W. Tillotson, Jr. (Field Columbian Museum Pub. 129, Dec., 1908; 32 pp.)

The author gives descriptions of anglesite, barite, calcite, epsomite, linarite, olivenite and a number of other minerals from various districts. Illustrated. 40c.

9242—ORE DEPOSITS—Modern Ancient Volcanoes and Ore Deposits. Arthur Lakes. (Min. Sci., Mar. 27, 1909; 2 pp.)

The author gives a number of illustrations to show that there is a strong relation between the presence of igneous rocks and ore occurrences. Illustrated. 20c.

9243—ORE FORMATION—Ores Formed by Magmatic Segregation. F. L. Garrison. (Min. and Sci. Press, Mar. 27, 1909; 5½ pp.)

A theoretical discussion of this method of ore formation. The author considers the ideas of several eminent geologists. 20c.

9244—ORE OCCURRENCE—The Association of Ores and Country Rock. Gordon Surr. (Min. Wid., Mar. 13, 1909; 2½ pp.)

A geological discussion drawing practical deductions on the association of various minerals in such a manner as to aid the prospector. 20c.

9245—ORE OCCURRENCE—Why are Mining Camps Centers of Mineralization? A.

Lakes. (Min. Sci., Mar. 4, 1909; ¾ p.) Continuation of the subject, giving a general summary and conclusions on ore deposits in volcanic rocks. To be continued. 20c.

9246—ORE OCCURRENCE—Why are Mining Camps Centers of Mineralization? Arthur Lakes. (Min. Sci., Mar. 11, 1909; 2½ pp.)

The paper deals with the occurrence of ores in sedimentary rocks associated with igneous intrusions. It treats in particular the occurrences at Leadville, Aspen, Breckenridge, and Red Cliff, Colo. Illustrated; to be continued. 20c.

9247—ORE OCCURRENCE—Why are Mining Camps Centers of Mineralization? Arthur Lakes. (Min. Sci., Mar. 18, 1909; 2½ pp.)

The seventh article of this series describes the peculiar ore deposits in schists, slates and limestones near igneous rocks. Illustrated. 20c.

9248—ORE OCCURRENCE—Why are Mining Camps Centers of Mineralization? Arthur Lakes. (Min. Sci., Mar. 25, 1909; 2 pp.)

Eighth and concluding article of the series; summarizing conclusions drawn and describing the mineral belt of Colorado. Gives illustration and map. 20c.

9249—SECONDARY IMPOVERISHMENT—An Instance of Secondary Impoverishment. Henry H. Knox. (I. M. M., Bull. No. 54, Mar. 1, 1909; 5 pp.)

Remarks advanced by members with the object of supplementing the general description, of Mr. Knox, by some details of minor importance.

9250—SOUTH AUSTRALIA—Report on Recent Mineral Discoveries in the Northern Territory. H. Y. L. Brown, Govt. Geologist. (Adelaide, 1908; C. E. Bristow, Govt. Printer. 13 pp.)

A report on the Mount Davis copper district, Pine Creek district; the recent tin and gold discoveries in the same district; the coal boring at Cliff Head, Anson Bay; the question of testing the Arm tin deposits by boring; and general mining matters of the district. Includes maps and illustrations.

9251—VIRGINIA—Mineral Resources of Virginia. E. A. Schubert. (Proc. Am. Min. Congress, Dec., 1908; 22 pp.)

The author discusses the mineral resources in a general way with reference to their economic value and the part they may play in the mineral and other industries of the United States. He discusses coal, iron, salt, copper, mica, manganese, lead and zinc deposits.

MINING GENERAL.

9252—ACCIDENTS—Mine Accidents. S. Reynolds. (Mines and Minerals, April, 1909; 1½ pp.)

The author points out the bad results which may come from overlooking small things about the mine. The solution to the problem will result largely from better discipline of the mines. 20c.

9253—AMERICA—The Mineral Wealth of America. R. W. Raymond and W. R. Ingalls. (Paper before A. I. M. E., Feb., 1909; 16 pp.) This article summarizes the mineral output of the American countries and gives an interesting historical discussion of the mining operations.

9254—COLOMBIA—Travel in Colombia. C. DeKalk. (Min. and Sci. Press, Mar. 6, 1909; 2 pp.)

Goes into the phases of the question which interest the mining engineer. Mar. 20c.

9255—CONCRETE—Use of Reinforced Concrete in Mines. A. L. Hodges. (Min. Sci., Mar. 25, 1909; 1½ pp.)

Treats of the many conditions wherein it may be used advantageously. 20c.

9256—DITCHES—Douglas Waterman. (Min. and Sci. Press, Mar. 6, 1909; 4 pp.)

The mathematical treatment of the question of finding the most economic ditch-section, with complete data and diagrams. Illustrated. 20c.

9257—EXAMINATION—The Professional Examination of Undeveloped Mineral Properties. Charles Catlett. (Paper before A. I. M. E., Oct., 1908; 9 pp.)

An outline of the form to be followed in mining reports. The author discusses the various phases of the report.

9258—HAULAGE—Gravity Planes. A. W. Evans. (Mines and Minerals, April, 1909; 3½ pp.)

A discussion of track and haulage arrangements in use in various places in Pennsylvania, West Virginia, Kentucky and Tennessee. Illustrated. 20c.

9259—MEXICO—Mining in the Alamos and Arteaga Districts. George M. Bloomer. (Eng. and Min. Journ., Apr. 3, 1909; 2 pp.)

A review of Northwestern Mexico, its mining industry and a detailed description

of a number of the mining districts. Illustrated. 20c.

9260—MEXICO—The Railroad Systems of Northern Mexico. H. A. Horsfall. (Eng. and Min. Journ., Apr. 3, 1909; 2 pp.)

A comprehensive discussion and map of the railroads in operation and under construction in Sonora, Chihuahua and Sinaloa. 20c.

9261—MEXICO—Traveling in Western Chihuahua, Mexico. Frederick H. Akeley. (Eng. and Min. Journ., Apr. 3, 1909; 2½ pp.)

Gives some notes on a trip through the Ocampo district, a short description of some of the more important mines, together with notes on climate and the necessary equipment for traveling. 20c.

9262—MINE ACCOUNTING. John G. Grant. (Can. Min. Journ., Mar. 15 and Apr. 1, 1909; 3 pp.)

The third and fourth of a series of articles relating to mine bookkeeping, in which the author describes various books to be used. Illustrated. 40c.

9263—MINE ACCOUNTING—The Auxiliary Books in Mine Bookkeeping. M. W. Alderson. (Min. Wid., Mar. 27, 1909; 2½ pp.)

The author describes some of the bookkeeping methods used by the Anaconda Mining Company. Illustrated. 20c.

9264—MINING LAW—Short Talks on Mining Law—XIV. A. H. Ricketts. (Eng. and Min. Journ., Mar. 27, 1909; ¾ p.) The author discusses water rights, timber lands and timber cutting. 20c.

9265—RECORD KEEPING as Applied to the Resident Engineer's Department of a Mine. H. L. Templer. (Journ. Transvaal Inst. Mech. Engrs., Feb., 1909; 10 pp.)

Details useful systems for keeping records of the various data coming within the scope of the resident mechanical engineer of the Transvaal. 60c.

9266—SAMPLING—Churn-Drill Sampling W. E. Thorne. (Min. and Sci. Press, Mar. 6, 1909; 1½ pp.)

Describes the best practice, making plain the errors which one is liable to commit. Drawings. 20c.

9267—SANTO DOMINGO—Some Investigations of Santo Domingo Minerals. C. W. Kempton. (Min. Wid., Apr. 3, 1909; 1½ pp.)

The author gives a few short descriptions of a number of the older mines in Santo Domingo, together with some notes on the principal ores. Illustrated. 20c.

9268—SHAFT SINKING in Wet Ground by Injecting Concrete. Jules Lombos. (Eng. and Min. Journ., Mar. 27, 1909; 2½ pp.)

A discussion of the method employed in sinking a shaft through wet ground, together with illustrations showing the manner in which the concrete was injected into the shaft from Bull. de la Société de l'Industrie Minière. 20c.

9269—SHAFT SINKING—Modern Shaft Sinking. F. Donaldson. (Mines and Minerals, April, 1909; 1½ pp.)

A description of a number of deep shafts; notes on contracts for shaft sinking; a description of the supplies and machinery needed. 20c.

9270—SHAFT SINKING—Problems of Shaft Sinking in a Michigan Salt Mine. Norman B. Keesley. (Min. Wid., Mar. 20, 1909; 1½ pp.)

Describes the difficulties met and how they were overcome by injecting concrete. Illustrated. 20c.

9271—TEXAS and Its New Mining Laws. W. D. Hornaday. (Min. Wid., Mar. 27, 1909; ¾ p.)

The author gives extracts from the new mining code relative to locating mining claims. 20c.

9272—TIMBER—Properties of the Usual Sections of Timber. George M. Adams. (Journ. Transvaal Inst. Mech. Engrs., Feb., 1909; 3 pp.)

Shows the methods for calculation and summarizes the results obtained in testing the usual sections of timber. 60c.

9273—TONNAGE ESTIMATION in Dumps, Open Cuts, Etc. R. J. Donaldson. (Eng. and Min. Journ., Mar. 27, 1909; 3 pp.)

The author discusses the density factors for solid and broken ore and also describes different methods for measuring tonnage. Illustrated. 20c.

9274—TRANSPORTATION in Its Relation to the Mining Industry. James Douglas. (Proc. Am. Min. Congress, Dec., 1908; 17 pp.)

The author discusses the interdependence of the mining and railroad industries. He gives statistics of tonnage of freight handled, the distribution of copper in the United States, and the distribution of the coal and

iron mines, together with statistics of the coal and iron shipments by States. He also gives figures showing railroad rates and the actual cost of handling freight. Illustrated.

9275—**TRANSVAAL**—The Base Metals of the Transvaal. (So. African Min. Journ., Mar. 6, 1909; 2 pp.)

Official review of tin, copper, lead, cobalt, mica and molybdenum deposits, giving the names and descriptions of a number of the mines where these ores occur. Illustrated. 20c.

9276—**TUNNEL**—Roosevelt Tunnel. R. L. Horrick. (Mines and Minerals, April, 1909; 4½ pp.)

A detailed illustrated description of the tunnel, method of drilling, blasting, tramming and ventilation, with notes on the progress which has been made. 20c.

9277—**TUNNEL DRIVING** Records. R. L. Horrick. (Mines and Minerals, April, 1909; 4½ pp.)

The author makes comparisons of the speed of driving American tunnels with those of other countries. Also a comparison of methods, with tables of records obtained from various mining and tunnel companies. 20c.

9278—**TUNNELING**—Le Tunnel du Rotherbilly sous la Tamise, a Londres. Edmond Henry. (Génie Civil, Sept. 26, 1908; 5½ pp.)

A description of the methods and appliances for driving this tunnel through soft ground under the Thames river. 40c.

9279—**WALES**—Holywell-Halkyn Tunnel and Mines, Holywell, North Wales. John P. Jones. (Trans. Manchester Geol. and Min. Soc., Part 1, Vol. XXXI, 1909; 5½ pp.)

Describes the geology and history of the mines, and tells of the tunnel work, giving costs of same.

9280—**WEST AUSTRALIA**—Retrospect of West Australian Mining for 1908. (Aust. Min. Stand., Jan. 29, 1909; 1½ pp.)

A summary of the mining operations in Western Australia during 1908, and a general review of the industry. 40c.

9281—**WIRE ROPES**. C. Gafat. (Min. Engineering, April, 1909; 2 pp.)

The main portion of this article is devoted to the history of the wire rope. Rules for finding weight, breaking strain and safe working load are given. Illustrated. 20c.

ORE DRESSING—GENERAL.

9282—**MAGNETIC SEPARATION**—Le Traitement Magnétique des Minerais et son Emploi, dans le Pays de la Sieg, pour minerais de fer Späthglets. J. W. Bartsch. (Rev. Univ. des Mines, Aug., 1908; 38 pp.)

A general discussion of the principles of magnetic separation, and a full description, with costs, of two European plants for treating spathic iron ores. \$1.

METALLURGY—GENERAL.

9283—**ALLOYS** for Use in the Brass Foundry. Joseph H. Hart. (Mech. Engr., Mar. 19, 1909; 2 pp.)

Discusses the adaptability of the electric furnace for the manufacture of alloys and summarizes the composition of the alloys in common use. Illustrated. 20c.

9284—**CHLORINATION**—The Theory of Dry Chlorination of Sulphide Ores. F. W. Trappagan. (West. Chem. and Met., March, 1909; 2½ pp.)

The feature of this new process is that oxidation is prevented and the operation carried on so that chlorides are the only products formed. 80c.

9285—**ELECTRO-CHEMISTRY** in 1908. F. M. Perkin. (Electrician, Mar. 26, 1909; 3½ pp.)

The author gives a review for the year 1908, with notes on electrolytic copper, gold and silver, chlorine, ozone, fixation of atmospheric nitrogen, and the aluminum industry. 40c.

9286—**ELECTROMETALLURGY**—The Behavior of the Nickel Anode and the Phenomena of Passivity. E. P. Schoch. (Am. Chem. Journ., March, 1909; 25 pp.)

Describes studies conducted with a view of locating the equilibrium potential. Illustrated. 40c.

9287—**ELECTROMETALLURGY**—The Electromotive Force of Nickel, and the Effect of Occluded Hydrogen. E. P. Schoch. (Am. Chem. Journ., March, 1909; 24½ pp.)

A chemical treatise detailing experiments performed in summarizing results obtained. Illustrated.

9288—**METALLOGRAPHY**—Notes on Metallography. W. G. Haldane. (West. Chem. and Met., March, 1909; 8 pp.)

Summarizes the characteristics necessary in bearing metals; white metals and bronzes. Diagrams. 80c.

9289—**MICROSCOPIC STUDY**—The Application of the Microscope to the Study of Metals. Walter Rosenbalm. (Mech. Engr., March 19, 1909; 4½ pp.)

Summarizes the information to be gained from microscopic examinations of metals. Illustrations of the sections of alloys as viewed under the microscope. 40c.

9290—**PLATINUM-ANTIMONY**—Ueber das Schmelzdiagramm der Platin-Antimonlegierungen. K. Friedrich and A. Leroux. (Metallurgie, Jan. 8, 1909; 5½ pp.)

Results of experiments on the composition and formation of eutectics of platinum and antimony, illustrated by microphotographs. 40c.

9291—**SMELTIER FLUES**—The Design of Smelter Flues. E. A. Lee. (Bull. Colo. Sch. Mines, Jan., 1909; 9 pp.)

Discusses the conditions to be met in flue construction and gives details for the various types. Includes drawings. 40c.

9292—**SMELTIER FLUES**—Problems in the Utilization of Smelter Flues. Joseph H. Hart. (Min. Wld., April 3, 1909; 1 2/3 pp.)

In this article the author discusses mechanical refrigeration as used in the dayley process. He also gives some notes on the manufacture of sulphuric acid. 20c.

9293—**WASTE PRODUCTS**—Utilization of Wastes from White Metals, Reclaiming of Drosses and Recovering Tin and Zinc from Tinned and Galvanized Iron. (Brass Wld., March, 1909; 4½ pp.)

The author gives his own experiences with such work and many practical suggestions. This is the first article of a series. 20c.

9294—**WELDING** with the Oxygenite Process. E. F. Lake. (Am. Mach., Mar. 18, 1909; 3 pp.)

An article descriptive of the apparatus and materials used. Gives the time and cost of cases in welding different jobs, and illustrations of the apparatus used. 20c.

MINING AND METALLURGICAL MACHINERY.

9295—**AERIAL TRAMWAYS**. C. W. Stancliffe. (B. C. Min. Exch., Jan., 1909; 3 pp.)

General discussion of aerial ropeway systems dealing with the advantages and factors affecting installation. Illustrated. 20c.

9296—**BOILER FURNACES**—Selection of Coal for Boiler Furnaces. D. T. Randall. (Power, April 6, 1909; 3 pp.)

The author gives some notes on the general consideration of types of furnace, and the selection of coals, with recommendations as to the most desirable specifications. 20c.

9297—**BOILER PRACTICE**—Chemistry Applied in the Boiler Room. Jacques Negru. (West. Chem. and Met., March, 1909; 11 pp.)

This article points out the application of chemistry in effecting smoke prevention and the curbing of losses, with discussion by other authors. 80c.

9298—**BOILER WATER**—Proper Treatment of Boiler Feed Water. A. J. Boardman. (Power, Mar. 23, 1909; 3½ pp.)

Details the data from plant which reduced maintenance charges \$160 per month by analyzing feed water and treating with soda ash and lime. Gives charts. 20c.

9299—**BOILERS** and Boiler Compounds. C. M. Chubb. (Eng. Journ. of Canada, March, 1909; 4½ pp.)

This is a practical presentation of the difficulties met with in feeding water to boilers. The author discusses the impurities in water and how to deal with them. 20c.

9300—**CHEMICAL APPARATUS**—Apparatus for Weighing and Measuring Solids, Liquids and Gases. (Chem. Engr., March, 1909; 6½ pp.)

Fourth of a series of articles describing the apparatus used for weighing solids and liquids for industrial purposes. Illustrated. 40c.

9301—**DRILL**—The Stephens Climax Imperial Hammer Drill. Eustace M. Weston. (Eng. and Min. Journ., Mar. 27, 1909; 1½ pp.)

The author discusses the advantages and disadvantages of the Climax drill and also gives into details of its mechanical construction. Illustrated. 20c.

9302—**ELECTRIC AND FUEL FURNACES**. F. Louvler. (Electrochem. and Met. Ind., April, 1909; 3½ pp.)

Discusses the growing importance of the electric furnace in certain branches of metallurgy. Illustrated. 40c.

9303—**ELECTRIC ENGINE PLANE**—

Elektrisch betriebener Haldenanzug der Oesterreichischen Alpen Montanengesellschaft in Donawitz. (Oest. Z.-t. f. B. U. H., Dec. 12, 1908; 7 pp.)

Describes construction and operation of an electrically driven hoist for balanced haulage on an inclined plane. 40c.

9304—**ELECTRICITY** in Mines. T. J. McKavanagh. (Journ. Min. Soc. of Nova Scotia, Vol. XIII, 1908; 8 pp.)

The author discusses generating plant, distribution, switches and motors; the static application of electricity to drills and coal cutters, ventilation, haulage and winding.

9305—**ELECTRICITY**—The Direct-Current Motor in Mining Service. C. S. McGlenis. (Min. Wld., March 27, 1909; 1½ pp.)

The author discusses the advantages and disadvantages and gives illustrations showing the proper method of wiring. 20c.

9306—**FUEL ECONOMY**—Notes on Fuel Economy and Its Application to Nova Scotia. A. A. Hayward. (Trans. Min. Soc. of Nova Scotia, March 1908; 16 pp.)

The author discusses fuel economy in a general way, and gives particulars of the cost of gas producers, showing the yearly cost of operating a gas plant. Illustrated.

9307—**FURNACE CONSTRUCTION**—Tube Tiles Used to Form Furnace Roofs. A. Bement. (Power, April 6, 1909; 4 pp.)

The author describes the use of refractory brickwork tiles and gas-tight bolsters showing the efficiency and prevent smoke. Illustrated. 20c.

9308—**GAS ENGINE PRACTICE**—Experiments on a Method of Measuring the Air or Gas Supply to Engines and Furnaces. Andrew G. Ashcroft. (Proc. Instn. Civ. Engrs., Vol. CLXXXII, Vol. III, 1908; 11 pp.)

Outlines of experiments performed with externally driven oil engine. The paper is accompanied by five sheets of drawings from which the figures in the text are prepared. Illustrated.

9309—**GAS ENGINES**—A Method of Improving the Efficiency of Gas Engines. Thos. Butterfield. (Proc. A. S. M. E., Apr., 1909; 11 pp.)

A discussion of the various methods for improving the efficiency of gas engines, together with the record of a number of tests and experiments.

9310—**GAS ENGINES**—The Use of Large Gas Engines for Generating Electric Power. L. Andrews and R. Porter. (Iron and Coal Tr. Rev., Feb. 18, and 26, 1909; 4½ pp.)

A discussion of the relative costs in generating power by steam turbines and by gas driven generators. Illustrated. Paper before Brit. Instn. of Elec. Eng., Feb. 16, 1909, 60c.

9311—**GAS PLANT** of an Ontario Mine. (Eng. Journ. of Canada, March, 1909; 3 pp.)

Illustrated description of a Weber three-cylinder gas engine plant at the Nancy Helen mine of Cobalt, Ont. 20c.

9312—**GAS POWER**—Some Effects of Gas Power on Efficiency and Developments of the National Industry in Germany. F. E. Jung. (Iron Tr. Rev., Feb. 25, 1909; 3½ pp.)

Economical study of conditions in Germany. 20c.

9313—**GAS POWER PLANT** as a Means of Fuel Conservation. Charles L. Lucke. (Eng. Mag., April, 1909; 5 pp.)

A review of the fundamental physical process by means of which power is generated by internal-combustion engines, pointing out the possibilities of the gas engine as a conservator for fuel supply. 40c.

9314—**GAS PRODUCER** and Its Application. F. W. von Oven. (Clay Rec., Feb. 15, 1909; 4 pp.)

The merits of gas producers and producer gas-fired furnaces in various types of work. 20c.

9315—**GAS PRODUCER PRACTICE**—Pyrometers in Gas Producer Operations. L. L. Frink. (Progressive Age, Feb. 15, 1909; 2 pp.)

Details of a method of controlling fires and the consequent evolution of gas by means of temperature indication. 20c.

9316—**HAULAGE**—Lerange Controllers for Electrically Driven Haulage Gears. (Iron and Coal Tr. Rev. Feb. 12, 1909; 1½ pp.)

Discusses the necessity for meeting certain conditions in design of controllers for haulage. Gives diagrams and illustrations. 40c.

9317—**HAULAGE**—Underground Electrical Haulage. (Aust. Min. Stand., Feb. 17, 1909; 2 pp.)

Enumerates the installations of electric haulage in Victoria and gives particulars of several important plants. Illustrated. 40c.

9318—HOISTING CAGE—Calcul et Construction des Cages d'Extraction. N. Desard. (Rev. Univ. des Mines, Jan., 1909; 30 pp.)

Discusses the mechanics of the hoisting cage and illustrates the method of designing a typical European cage. \$1.

9319—LOCOMOTIVES—German Mine Locomotives. Frank C. Perkins. (Min. Wld., Mar. 6, 1909; 1 p.)

Describes the electric locomotives used at the German mines, and tells their limitations. Illustrated. 20c.

9320—LOW-GRADE FUELS and the Power Plant. C. M. Ripley. (Elec. Wld., April 1, 1909; 2 pp.)

The author discusses the relative value of steam fuels; the use of coke screenings; methods of burning low-grade fuels and examples of economy from use of coke screenings 20c.

9321—OIL BURNING PLANT—Losses in Firing Fuel Oil. (Journ. A. S. M. E., Mar., 1908; 10 pp.)

Discussion by members of two papers by C. H. Weymouth, which were previously mentioned in this index, namely, "Fuel Economy Tests" and "Unnecessary Losses in Firing Fuel Oil and an Automatic System for Eliminating Them."

9322—OIL GAS PRODUCER—A Process of Making Gas from Oil. W. C. Willard. (Iron Tr. Rev., Feb. 11, 1909; 4 pp.)

Illustrated description of the method and apparatus which utilizes residuum oil, hitherto a waste product. 20c.

9323—PORTABLE WINCH—Ueber das Stempelrauben mittels Raubwinde im Kammbruchsbaue des k.k. Schachtes Julius. Dr. Bruck. (Gustav Ryba, (Oest. Zeit. f. B. u. H., Nov. 28, 1908; 5 pp.)

Describes a small geared winch, mounted on a track, with means for bracing it on the track, suitable for hoisting or hauling up grade in underground workings. 40c.

9324—POWER—Notes on the Cost of Power. H. G. Stott. (Proc. A. I. E. E., April, 1909; 24 pp.)

The author gives notes on the cost and influence of new plants, all of which are analyzed and shown in a number of curves which the author has plotted. 60c.

9325—POWER SUPPLY—Analysis of Proposed Change in Power Contract. Robert Shiley. (Eng. and Min. Journ., Apr. 17, 1909; 2 p.)

The author gives detailed cost of turbine operations and an analysis of proposed contracts for the sale of power by the companies operating in the Northwest. 20c.

9326—PRODUCER GAS—The Use of Producer Gas in Chemical and Metallurgical Industries. Gustav Nage. (Electrochem. and Met. Ind., April, 1909; 1½ pp.)

Discusses the technology of the use of producer gas. Gives drawings of types of furnaces. 40c.

9327—PUMP—Motor Driven Centrifugal Pump for Mine Use. C. Robinson. (Eng. and Min. Journ., Feb. 20, 1909; 1½ pp.)

Gives result of series of tests made upon six-stage Sulzer electrically-driven pump at Ojuela mine, Nipamí, Mexico. Gives data and diagrams. 20c.

9328—PUMPS—Cornish Pumps and Pumping Engines—1. and II. Henry F. Collins. (Min. and Sci. Press, Feb. 20 and 27, 1909; 4 pp.)

A discussion based on practical experience, treating the reliability, durability, flexibility, and adaptability for sinking against water of Cornish pumps. 20c.

9329—PUMPS—Electrically Driven Mine Pumps. S. F. Walker. (Eng. and Min. Journ., Feb. 20, 1909; 1½ pp.)

Describes advantages of electrically driven mine pumps, adaptability of series-wound, shunt-wound and three-phase motors, and relative advantages of three-throw plunger and centrifugal pumps. 20c.

9330—PYROMETERS—A Practical Note on Thermo-electric Pyrometers. Charles H. Wilson. (Electrochem. and Met. Ind., Mar., 1909; 1½ pp.)

A study of the Le Chatelier pyrometer. 40c.

9331—REPAIRING LEAKY SEAMS. U. Bagnoli. (Trans. N. Eng. Inst. Min. and Mechan. Eng., Jan., 1909; 12 pp.)

A discussion, with illustrations, of apparatus for forcing cement into seams in boilers and furnaces. 20c.

9332—ROPE-DRIVING at Rolling Mills and Collieries. (Iron and Coal Tr. Rev., Mar. 5, 1909; 2 pp.)

A discussion of the transmission of power by ropes, with a number of examples taken from plants where it is used extensively. Illustrated. 40c.

9333—SAFETY LAMP—La Lampe de Sécurité. J. B. Marsaut. (Bull. Soc. de l'Ind. Minérale, March, 1909; 26 pp.)

Discusses and illustrates safety lamps of practically every known type.

9334—STEAM AND GAS ENGINES—Graphical Comparisons of Steam and Gas Engines as Power Producers. Harold W. Slauson. (Iron Age, Mar. 1, 1909; 1 p.)

A comparison based upon efficiencies, fuel consumption and the cost of operation under different conditions. Charts. 20c.

9335—STEAM BOILERS—Dampfkessel-Konstruktion der Unschiede und Verhütung. (Berliner, Feb. 25, 1909; 1 p.)

Treats of the causes and prevention of corrosion in steam boilers. 20c.

9336—STEAM TURBINE—Das Verhalten der Turbine bei verschiedener Belastung. J. Baril. (Turbine, Feb. 20, 1909; 6 pp.)

A thorough discussion of how the turbine acts on the different loads, dealing with the case of the impulse and reaction turbine. Goes fully into the theory. 20c.

9337—STEAM TURBINE—The Bergmann Steam Turbine. (Coll. Guard, Feb. 5, 1909; 2½ pp.)

Detailed discussion of a new turbine utilizing exhaust steam. Illustrated. 40c.

9338—STEAM TURBINE—Versuche über Oberflächekondensationen, insbesondere für Dampfturbinen. E. Josse. (Zeit. des Vereines Deutscher Ingenieure, Feb. 27, 1909; 8 pp.)

A theoretical discussion of the effects of surface condensation in the steam turbine. Illustrated. 20c.

9339—STEAM TURBINES—Die neuesten und wichtigsten ausländischen Patente auf dem Gebiete der Turbinentechnik. (Turbine, Feb. 20, 1909; 2½ pp.)

Résumé of the recent foreign patents granted regarding turbines. Illustrated. 20c.

9340—STEAM TURBINES—Ueber die Befestigung von Dampfturbinschaufeln. Wilhelm Gentsch. (Turbine, Feb. 20, 1909; 4 pp.)

Shows various methods adopted for mending vanes in the steam turbine, with sketches. 20c.

9341—STOPE DRILL COMPETITION. (So. African Min. Journ., Feb. 20, 1909; 2 pp.)

Fully describes first day's trials and summarizes the results obtained to date. Gives an illustration of the Holman type in operation. 20c.

9342—STOPE DRILL CONTEST. (So. African Min. Journ., Feb. 27, 1909; 1 p.)

Some details on the operations of the Flottmann, Westphalia and Climax Imperial hammer drills, also a table showing comparative results. 20c.

9343—STOPE DRILL CONTEST. (So. African Min. Journ., March 6, 1909; 1 p.)

This article contains notes on the Hoggate, Siskol, Murphy and Konomax drills, together with tabulated results of one week's work. 20c.

9344—TURBINE BLOWERS—Ueber Turbinenbläser. C. Regenbogen. (Stahl u. Eisen, Nov. 25, 1908; 24½ pp.)

Describes a number of furnace blowers, built on the turbine principle and discusses their operation. 40c.

9345—WATER POWER—The Hydro-Electric Developments of the Nevada-California Power Company. H. D. Chapman. (Eng. Rec., Mar. 6, 1909; 4½ pp.)

Describes the system which supplies electric power to the extensive mining fields of Southern Nevada. Illustrations of details of the plants. 20c.

9346—WATER POWER—The White Coal of Sweden. J. G. Leight. (Cassier's Mag., Feb., 1909; 25 pp.)

A study of the development of the hydraulic power of Scandinavia. Illustrated. Maps. 40c.

9347—WATER POWER PLANTS—Penstocks for Water Power Plants. F. Koester. (Eng. Rec., Feb. 20, 1909; 2½ pp.)

Discusses advantages of various types of penstocks and cites examples. Some important details are treated. Illustrated. 20c.

9348—WOOD BURNING—Burning Wood Under Boilers. E. G. Tilden. (Eng. and Min. Journ., Mar. 6, 1909; ½ p.)

Describes the operation of two 60 in. x 16 ft. tubular steam boilers using wood as a fuel. Illustrated by line drawings. 20c.

9349—ALUMINA—A Direct Volumetric Method for the Determination of Alumina. W. H. Seamon. (West. Chem. and Met., Feb., 1909; 2½ pp.)

Outlines a new and rapid method for laboratory determination. 80c.

9350—ARSENIC—The Volumetric Determination of Small Amounts of Arsenic. L. W. Andrews and Henry V. Farr. (Am. Journ. Sci., Apr., 1909; 5 pp.)

This article contains a description of the process used, together with tabulated results of a large number of laboratory experiments. 60c.

9351—ARSENIC AND ANTIMONY—The Determination of Arsenic and Antimony in Ores. Thomas Brown. (Mex. Min. Journ., March, 1909; 1 p.)

A description of Low's modification of the Pierce method. 20c.

9352—ASSAY OFFICE—The New Government Assay Office in Salt Lake. L. S. Kerfoot. (Salt Lake Min. Rev., Feb. 28, 1909; 2½ pp.)

Describes the general purposes, operations, office and equipment of the new Government plant. 20c.

9353—ASSAYING—Conversion Tables for Assay Valuations. W. J. Sharwood. (Mines and Minerals, Jan., 1909; 1 p.)

A series of tables to facilitate the reduction of certain assay values to a common basis. 20c.

9354—ASSAYING—The Temperature of the Lead Button in Cupellation. R. H. Bradford. (Journ. Ind. and Eng. Chem., Mar., 1909; 3 pp.)

Discusses temperature conditions when "feathers" form, and describes pyrometer for measurement of these temperatures. Illustrated. 60c.

9355—BRASS ANALYSIS—Apparatus Used in Rapid Method of Electrolytic Analysis of Brass. T. S. Price and T. C. Humphreys. (Journ. Soc. Chem. Ind., Feb. 15, 1909; 7 pp.)

Describes rotating and stationary electrodes and outlines method of analysis. Illustrated. 20c.

9356—BRASS ANALYSIS—Determination of Iron in Brasses and Bronzes. I. M. Brozowsky and L. W. Spring. (Journ. Ind. and Eng. Chem., Mar., 1909; 1½ pp.)

Describes a laboratory method which really determines the iron content. 60c.

9357—COPPER AND CHROMIUM—On the Volumetric Estimation of Copper and Chromium, and of Copper, Chromium and Iron in Admixtures. Eva Hibbert. (Journ. Soc. Chem. Ind., Feb. 27, 1909; 1½ pp.)

Describes a process by means of which these three metals can be volumetrically determined in the presence of each other. 20c.

9358—CRUCIBLE—The Munroe Crucible. Walter O. Snelling. (Journ. Am. Chem. Soc., Apr., 1909; 5 pp.)

A description of this platinum crucible, method of preparation and general notes on the use. 80c.

9359—ELECTRO-ANALYSIS—Rapid Electrolytic Analysis with Stationary Electrodes. John T. Stoddard. (Journ. Am. Chem. Soc., March, 1909; 5 pp.)

Describes methods for obtaining rapid results using stationary electrodes and no agitation of the solution. 80c.

9360—FERROUS IRON IN MAGNETITE, Determination of. R. E. Gage. (Journ. Am. Chem. Soc., March, 1909; 3½ pp.)

Discusses the errors caused by the action of the manganous salts on the permanganate. 80c.

9361—HYDROCHLORIC ACID—A Method for Preparing Standard Hydrochloric Acid Solutions. G. A. Hulett and W. D. Bomer. (Journ. Am. Chem. Soc., March, 1909; 4 pp.)

Details the method and considers the definiteness of the composition of the constant boiling acid and its variations with pressure. 80c.

9362—LEAD AND MANGANESE—The Electrolytic Estimation of Lead and of Manganese by the Use of the Filtering Crucible. B. A. Gooch and F. B. Beyer. (Am. Journ. Sci., Jan., 1909; 6 pp.)

Describes a descriptive and quantitative method of the Kent Chemical Laboratory of Yale University. Illustrated. 60c.

9363—TITANIUM—A Volumetric Method for the Estimation of Titanium and of Titanium and Iron in the Presence of Each Other. Eva Hibbert. (Journ. Soc. Chem. Ind., Feb. 27, 1909; 1 p.)

A discussion of the methods especially adapted for the estimation of titanium in minerals and steel. Illustrated. 20c.

9364—VANADIC AND ARSENIC ACIDS—The Estimation of Vanadic and Arsenic Acid and of Vanadic and Antimonic Acids, in the Presence of One Another. Graham Edgar. (Am. Journ. Sci., Apr., 1909; 3 pp.)

Notes on the use of a process of differential reduction to determine these elements in the presence of one another. 60c.

CHEMICALS, MINERALS, RARE EARTHS, ETC.—CURRENT WHOLESALE PRICES.

ABRASIVES—			COPPERAS— Bulk.....100 lb. \$0.55			POTASSIUM—

SMOOTH-ON ELASTIC CEMENT

Saved \$350

BY REPAIRING THIS JOB

Perhaps you think that SMOOTH-ON ELASTIC CEMENT is only good for the comparatively small repairs, such as tightening screw thread joints, fixing blemishes in castings, etc.

You've got another guess coming!

The above illustration shows a partial view of a re-heating receiver between the high and low pressure cylinders of a 32 and 70 by 72 cross compound Corliss Engine. After being installed a short time the packing at center, joining the cast-iron shells, gave out. It was estimated that to disconnect the exhaust pipe and coil and repack the joint would cost \$350.

The engineers finally resorted to SMOOTH-ON ELASTIC CEMENT. The engine was shut down and the air pump kept running so as to produce a vacuum in the receiver. SMOOTH-ON was then applied with a brush to the hot receiver, the vacuum drawing the SMOOTH-ON into the joint. A torch was then applied, causing the SMOOTH-ON to quickly harden. The leak was permanently repaired, the engine started up again, and the owners were \$350 in pocket.

New Type of Washer for Low-grade Gold Ores

A Machine Which Has Been Found to Be Superior to Other Types for Treating the Saprolitic Ores of the South Atlantic States

BY JOSEPH HYDE PRATT*

One of the more important changes to be noted in gold-mining practice in North Carolina is the introduction of a pulverizing and concentrating machine of the log-washer type, known as the Modern pulverizer and concentrator, for treating certain of the saprolitic ores that are found quite abundantly throughout many

which came in at the upper end. The logs were 20 to 30 ft. long and were more generally used to wash ores containing considerable clay.

The old principle of the log washer is unpatentable, but this new machine possesses many mechanical improvements that adapt it to the work that it is called

washers running at high enough speed to readily disintegrate the soft material and so mix the clay into a fine pulp with water that the gold can readily settle to the bottom. Each machine is essentially a long trough of boiler plate (two thicknesses $\frac{3}{4}$ and $\frac{1}{8}$ in. each) containing a revolving cylinder fitted with heavy cast-

FIG. 1. GENERAL VIEW OF THREE SETS OF UNITS IN POSITION

portions of this State. The old log washer consisted of a trough that was slightly inclined when in use and fitted with a couple of revolving steel or wood logs, to which were fixed spiral arms. These advanced the material to be washed from the lower end against the water

upon to do. The saprolitic ores of these South Atlantic States contain a great deal of clay and it has been found impossible to save the gold by ordinary sluicing and amalgamation.

THE NEW MACHINE

Each separate unit of this new machine, Fig. 2, consists of two improved log

iron arms set spirally so that the ore, while being hammered fine, is gradually worked to the discharge end, which is raised 6 in. higher than the feed end, Fig. 4. At the end of the washer, the larger, hard and nearly barren quartz stones are removed by a revolving screen and belt conveyer, this being done to save wear and power in the second washer, where the

*State Geologist of North Carolina, Chapel Hill, N. C.

gravel is still farther reduced in size and more gold settles out.

From the trommel of the first machine, the coarse material is carried by either a traveling belt or an open-slucio box to the riffled-slucio box outside the building. The boxes are about 12 in. wide and nearly 200 ft. in length. The material, after passing through the second washer, is again screened, and the screenings run into the same line of sluice boxes as the first screenings, Figs. 3 and 5. The riffles of these sluices are made by boring inclined holes in a board that just fits the sluice box. Mercury is then placed in these holes. The pulp from this second screen, free from stones, passes through special riffled sluices about 4 ft. wide and 8 to 16 ft. in length, which contain mercury to amalgamate and save any free gold that does not settle in the machine. From these broad riffle sluices it passes to the narrow ones, 200 ft. long, through which the coarser material has passed.

The steel troughs are about 2 ft. wide by $2\frac{1}{2}$ ft. deep, the first being 18 ft. long and the second 12 ft., with a semi-circular bottom and a flat wood top. The revolving cylinder is made of an 8-in. steel pipe

paddles against the surface of the water will also weight and sink some of the fine and flake gold that has a strong tendency to float off. As the discharge end of the machine is 6 in. higher than the feed end, the gold after it is once down among the pebbles of the bed, is not apt to be pushed out of the machine. Fig. 1 is a general view of three sets of units in position.

Riffles of the sluices are made by boring inclined auger holes in the planks laid lengthwise in the sluice boxes. Since all the coarse gravel has been screened out, there is little wear upon the riffles and the fall and quantity of water used are less than in the sluices of regular hydraulic mining. In cleaning up, the planks are lifted up and turned over and the gravel and mercury washed to the end of the sluice where quicksilver and amalgam are washed out in hand pans. When through cleaning up, the planks are simply replaced and the riffles filled with mercury and the machine started again.

In cleaning the washers, which is usually done twice a week, the machines are stopped and all the gravel within washed out with a hose through an opening in the

danger of the gold being washed out. While a large capacity is of advantage and desirable, still it will mean danger of insufficient grinding, too thick pulping, or too strong a flow of water. A great deal of skill and patience is, therefore, required in adjusting these machines, but when once adjusted, they will work satisfactorily. It is to be recommended that a first unit be installed and run for several months at various speeds, capacities and amounts of water, giving the machine sufficient time after each change of conditions to adjust itself. Also careful tests of the ore and tailings should be made between times. The capacity and speed should first be adjusted until the best result is given in reducing the amount of gold left in the tailings so combined that it will not pan. The pulp should, of course, be kept at a reasonable consistency throughout the changes and the amounts of water finally adjusted so that the tailings will show a minimum of free gold in the pan.

INSTALLATION AT THE SHUFORD MINE

These machines are made in Knoxville, Tenn. One of the first plants, one of

FIG. 2. MODERN PULVERIZER AND CONCENTRATOR

over a wood core carried upon a heavy steel shaft, passing through stuffing boxes at the ends of the trough.

Wrought-iron bars reach through this cylinder crosswise and project on one side about 1 to $1\frac{1}{2}$ in. to receive a nut that fits the thread turned on this end of the bar. The other end of the bar projects 3 in. beyond the cylinder as a rectangular-shaped plate and to this $\frac{5}{8} \times 2\frac{1}{2} \times 2$ -in. cast-iron arms or paddles are bolted. The greatest wear and tear of these machines is on the paddles, the life of which is four to six weeks. There are 48 of these paddles to the longer trough. There is about 4 in. clearance between these arms or paddles and the bottom of the troughs, which allows the formation of a bed of stones or pebbles; this reduces the wear on the bottom of the trough and also assists in saving the gold. This bed of stones is, of course, more or less shaken up by blows from the large fragments of quartz and by the revolving paddles, thus permitting the gold to settle through these to the bottom of the trough similarly as in panning. The constant striking of the

bottom. This gravel is then panned by hand and the gold amalgamated. Any nuggets that occur in the rock are pounded free from quartz and are then also amalgamated. The amalgam from all sources is strained out of the quicksilver and then retorted and the hillion sold.

ADJUSTMENT OF THE WASHER

It is recommended by the makers that the first washer be driven at 150 to 250 r.p.m., and the second one at 250 to 350, and that for a capacity of 10 tons per hour, each machine be given 72 gal. of water per minute. This will then at times require 25 h.p. for a complete unit of two washers and trommels. These factors will vary greatly with the character of the ore. Since the power, and therefore, the wear, will increase even more rapidly than the square of the speed, this should be kept low. In the absence of any coarse stones, there is also danger that the pulp may be too greatly agitated to allow the settling of the gold. On the other hand, the speed and work must be sufficient to grind up the ore. If there is too much, there is a

four double units, was installed at the Shuford mine, Catawba county, North Carolina. The fines obtained by washing the ore over a grizzly are carried by means of jets of water down a trough about 35 ft. long, thus becoming pretty uniformly mixed before being divided among the four washers. The trough is divided at a point about 35 ft. from the grizzly and then each of these is subdivided into two troughs, each about 25 ft. from the first division. At each division point the mixture of ore and water strikes against sharp edges that divide the material nearly equally, sending one-half of the material into each trough. Each of these four troughs feed to a unit machine through the wooden top of the trough. At this mine the machines are run at only 150 r.p.m. They were tried at a lower speed, but there was trouble with the gold sticking to clay balls. The machines use about 150 gal. of water per minute and the whole plant is run by a 35 h.p. engine which, when the three units are running, is probably overloaded. The tailings, when tested, usually pan nothing

at all, but assay a few cents, due to gold included in the sand. While this loss could be reduced by speeding up the second washer to grind the sand finer and trusting to the rifles to save what little additional free gold would not then settle in the machine, it is doubtful whether with the present small plant and so vast a quantity of ore controlled by the company such refinements are advisable, since they would probably reduce the capacity of the plant. It is estimated that the present cost of treatment is 22c. per cu.yd. loose measure with a recovery of between 50

contain the workable mineral deposits. This latter area is covered with auriferous quartz and the soil is also auriferous. The underlying schists and gneisses were found to be penetrated by seams of auriferous quartz which ran in every direction. There were, however, no veins, strictly speaking, although some of the quartz seams were several inches in thickness, and were persistent for a considerable distance in length and depth. The entire surface for a width of 300 ft. or more, and for a distance of 1000 to 2000 ft. is ore, assaying 50c. to \$1 per cu.yd. When

and their area; and also because it was desired to test with them the practicability of the new type of log washer. The process proved successful and the mine is now being profitably operated. Instead of attempting to mine the ore by stoping and trying to eliminate the low-grade material, a method of open-pit work, Fig. 7, was introduced, and all the material taken out was treated in the separators. The pit is now 90 ft. deep and 200 to 300 ft. across the top.

When mining was first started, the ore was drawn out of the pit by means of a

FIG. 3. SCREENS USED AFTER MATERIAL HAS PASSED THROUGH SECOND WASHER

FIG. 4. TROUGH OF BOILER PLATE CONTAINING REVOLVING CYLINDER

FIG. 5. SLUICE BOX AND TRAVELING BELT

FIG. 6. SELF-LOADING SCRAPE

and 75c. per cu.yd. A great deal of the success of the Catawba Gold Mining Company is due to its conservative policy, and the skill with which the whole mining and milling operation has been conducted.

PROPERTY OF THE CATAWBA COMPANY

The property owned and operated by the Catawba Gold company will bear a short description. The mine is situated in Catawba county, N. C., $\frac{1}{4}$ miles slightly south of east of Catawba, a station on the Southern railway. The mining tract comprises about 425 acres, of which 20 acres

the property was first opened, an attempt was made to mine by sinking shafts, running drifts and then stoping, but was practically a failure from the start. A shaft was sunk to a depth of 115 ft., and several levels started from this and some stoping carried on. Although many of the narrow quartz seams contain gold in some quantity, it was too expensive to mine it on account of the amount of waste material that had to be removed. About 1904, after the property had been closed for many years, it was bought on account of the depth to which the saprolites extended

self-dumping skip running on a wooden track, and discharged on a grizzly at the top of a pit. While this method handled the ore very cheaply, more economy was desired, and finally an ingenious method was devised consisting of self-loading scrapes, Fig. 6, holding from three-fourths to nearly two tons of ore. There are two of these scrapes on an endless wire rope, the loaded scrape pulling the empty one back down into the pit, Fig. 7. The ore is broken down from the sides of the pit by blasting with powder, the holes being 20 ft. deep, and al-

lowed to fall in piles at the bottom. The scrapes, as they are pulled back into the pit, are hauled over this and then, when started toward the surface, their own weight causes the edge of the scrape to be pulled down into the ore and they are readily filled by the pull of the cable. A loaded scrape can be dumped in the hopper about every 75 seconds. The scrapes are 5 ft. wide, $5\frac{1}{2}$ to 6 ft. long, and 18 in. high at rear, tapering somewhat toward the front end. The bottom of the scrape

drops out. A special blade and handle permits of emptying in a few seconds. The hopper is in the shape of a circular trough made of boiler plate, into which flows two streams of water of sufficient volume and strength to wash the ore through a grizzly and then to the concentrating machines.

According to the *Journal Soc. Chem. Ind.*, March 31, 1909, it has been shown that small quantities of bismuth exert lit-

German Diatomaceous Earth

Infusorial or diatomaceous earth finds many practical applications, notably in the manufacture of dynamite, polishing soaps, soluble glass, gutta-percha articles, and many other things. Germany has long been the principal producer of this earth and affords the best qualities. The principal deposits are in Hanover, where the *Kieselguhr* occurs in beds among other alluvial deposits or in proximity with lignite seams. It generally forms a granular mass of gray, brownish or pale green color; it has a dry feeling, absorbs water with avidity, is friable, and at ordinary temperatures resists chemical decomposition. It occurs in great quantities near Hützel, in the Lümberger Helde, and at Unterlössen, in the same part of Hanover. It is also found at Vogelsberg, in Hesse, at Jastrobe, in Hungary, at Franzenbad, in Bohemia, and in Tuscany.

The valuable characteristics of the earth are its light weight, its absorptive power, and its non-conductivity of heat, which makes it one of the best insulating materials. It is mined in much the same way as brick clay, in open pits. It is then spread on planks or on the bare ground, in the sunshine, to dry. Artificial methods of drying do not seem to prevail. The earth should never be allowed to come in contact with flame, as it will calcine rapidly. There is no special necessity for drying *Kieselguhr* beyond that point accomplished by the sun, and, although numerous artificial means have been tried, they have not come into general use. Dry-air ovens may be advantageous in wet seasons, but are not economical except with the very finest grades of earth, such as are used for dynamite.

As the earth comes from the ground, it contains 70 to 90 per cent. of water; after drying in the sun, it still retains 15 to 25 per cent. of moisture. During shipment, it must be carefully protected from moisture.

According to *Engineering-Contracting*, April 7, 1909, the record for daily excavation in the central division of the Isthmian Canal was broken on Feb. 27, 1909. On that day 59 shovels excavated 77,064 cu.yd., an average of 1306 cu.yd. per shovel for the eight-hour day. The material excavated was loaded in 2177 Lidgerwood flats, 352 large western dump cars, and 2754 small western and Oliver dump cars, a total of 5283 carloads.

According to the *South African Min. Journ.*, March 13, 1909, the Consolidated Goldfields group yielded the following profits during February: Simmer and Jack, £57,568; Robinson Deep, £42,746; Knights Deep, £24,101; Simmer East, £7470; Simmer Deep, £10,546; Jupiter, £5413; Luipardsvlei, £5182 and the Nigel Deep, £738, making a total of £153,704.

FIG. 7. OPEN-PIT WORK

extends only for a distance of about 18 in., the ore between the remainder of the side pieces of the scrape resting on the ground. The scrapes run in a trough or trench in the dirt, the steeper portions of which are protected by scantling. As the scrape comes to the top it runs over a hopper and most of the ore immediately

falls out. A special blade and handle permits of emptying in a few seconds.

According to *Engineering* a contract has been made with Messrs. Sir John Jackson, Ltd., for building 300 miles of railroad across the Andes from Arica, Chile, to La Paz, Bolivia.

Concentrating Difficult Lead Ores at Broken Hill

Auxiliary Concentrating Department Used at Block 10 Mill When Price of Lead Is High. Gangue Rocks Contain Unusual Amount of Rhodonite

BY GERARD W. WILLIAMS*

The ore at the Broken Hill Block 10 Mine, Ltd., New South Wales, is similar in nature to that treated at the adjoining mine of the Broken Hill Proprietary Company. In the matter of rhodonite the gangue is intermediate between the quartz-calcite of the South and North mines, and the markedly rhodonite-bearing ores of the Junction North and British mines. The mill, which is of recent construction, embodies certain departures from the normal type. In particular the final concentration of the sands and slimes is so arranged that any set of tables may be cut out and the sands run direct to the dump as soon as it is shown that the price of lead will not permit of profitable closer concentration. As every unit and subunit is driven from separate motors, and as strict and careful assays are kept of the work done on any set of tables it may be easily determined when it no longer pays to further concentrate any particular class of tailings.

THE MILL

The mill comprises four units each independent of the other and driven by separate motors, as well as an auxiliary series of slimes retreatment vanners and a vanner extension series of concentrators. The two latter can be cut out of circuit when the concentrates obtained no longer show a profit on working costs. It follows, then, that with lead at a high price the percentage recovery of lead will be higher than when the metal stands low on the market and it no longer pays to reconcentrate the slimes and tailings.

The ore from the mine, after passing the weigh bridge, is tipped from the trucks over a 1½-in. grizzly. The oversize is distributed between two Austin gyratory crushers which break down to 1½-in. cubes. The crushed ore is conveyed by aerial tram to the mill bins. The mill is situated about half a mile away from the shaft. The serious creep on this and the adjoining mines a few years ago destroyed the old mill and rendered the ground in the vicinity of the shafts unsafe for further building purposes. As before stated, the mill consists of four sections together with two auxiliary sections common to the four units. For the present only one unit will be described.

The ore from the bins is fed on a shaking screen by means of roll feeders. This screen has 3-mm. punched holes. The oversize is fed to a pair of Cornish rolls. The rolls are 30x15 in., and run at 14

r.p.m. These rolls have a maximum capacity of 1000 tons per week. The crushed ore from the rolls is divided over two trommels, each 6 ft. long and lined with punched steel (½-in. diameter holes). The trommels are fitted with longitudinal strips of 1½-in. angle iron, riveted at 2-ft. intervals in the trommels. These strips of iron have added considerably to the efficiency of the trommels. It seems that the strips prevent the ore from sliding round inside and by frequently lifting up the ore and allowing it to fall back on the screen a high screening efficiency is obtained.

TANDEM ROLLS ABANDONED

The oversize from the trommels is returned by a raff wheel to the rolls. The experiment of running two pair of rolls in tandem was tried, the second pair taking the oversize from the first pair. The management states that the power costs were increased by 60 per cent. as against the present method, while slimes were only reduced by 5 per cent. As each unit at this mill is driven from separate motors, power costs are readily and accurately determined.

The undersize from the trommels (i.e., product passing an ¼-in. diameter hole) passes over a small conical spitzlutte. The underflow runs to a double-compartment coarse jig. From the first two compartments concentrates are obtained, from the third and fourth compartments the middlings are elevated to a No. 4 Krupp ball mill. These mills grind from 4 to 5 tons per hour to pass a 3/64-in. hole. The pulp from the ball mill goes to a spitzlutte, and the underflow is fed to a double-compartment fine jig. The slime overflow from the spitzlutte at the head of the coarse jig passes through a small spitzkasten and the underflow is run over a Wilfley table. The tailings and slimes from this table, together with the overflow from the spitzkasten and the overflow from the fine jig spitzlutte gravitates to the slimes thickener. This thickener takes slimes from all the units and for the time being may be left out of consideration.

The tails from the coarse jigs are sent to draining bins and then to the dump. To return to the fine jigs: Concentrates are obtained from the first two compartments, the middlings from the third and fourth compartments are returned by elevator to the Krupp mill already referred to, and the tails go to the boot of another elevator which delivers them to two 5-ft. Forwood-Down grinding pans. The product from the pans is concentrated on two

Card tables. The concentrates go to the shipping bins, the tails to drainage bins and then to the dump, and the middlings run to a spitzkasten. This spitz, which for purposes of reference will be called spitz "A," delivers the underflow to two single-belt slimes vanners. The tails from these vanners go to the dump, the middlings to the "vanner extension" house and the concentrates to the shipment bins.

SLIME TREATMENT

It is now necessary to return to the slimes which went to the thickeners. From now on the plant will be considered as a whole, as the four units lose their individuality at this point. The slimes and fine sands in the thickener, which takes the overflow product from all spitzkasten and spitzlutten in the four units, is pumped to a distributing box. From this box the thickened slimes, are fed to four spitzkasten. The slime water which overflows runs to a sump which also receives the overflow from the main settling box. This sump receives all drainage water and after passing over "V" settlers the water is returned to the rolls.

The underflow from the four spitzkasten is distributed over 10 Card tables. The concentrates go to the bins, the tails to the drainage bins and the middlings from six tables are fed to the spitzkasten referred to previously as spitz "A." The middlings from the other four tables pass over a Card table and then pass on to the "vanner-extension" plant. The slimes from the "V" settlers, wherein the bulk of the slimes contained in the main sump return water are collected together with all drainage from the bins, trucking floors and all other places, are collected in a central sump and pumped to the "retreatment tables. The latter comprise four Wilfleys and five vanners.

The middlings from the "retreatment tables" pass to the "vanner-extension" plant. The latter comprises a series of "V" settlers, four spitzkasten, nine single-belt vanners and one Card table. As previously indicated, a strict check is kept on the assay value of all concentrates obtained from these two auxiliary plants, and they can be cut out as soon as the price of lead falls to the point when it no longer pays to retreat the middlings from the primary Card tables and slimes vanners.

SAMPLING AND AUXILIARY CONCENTRATION

The Block 10 is the only mine where the system of auxiliary concentrators is in vogue and in view of the extreme market

*Consulting engineer, Melbourne, Australia.

fluctuations of lead and silver the system has many advantages. The manager of this mine posts the assays for each set of concentrators in the mill. The assays are made for every shift and in consequence the mill officers and men know at once which shift is doing the best work. The result is that a certain spirit of rivalry is created, which naturally tends to better work all around.

Too often, but little attention is paid to accurate sampling and, as a result, the actual work done on any particular set of tables is unknown. But where a careful record of the work of each shift in every department is kept the mill officers can at once place their hands on the weak spot. Detailed assaying of this character naturally involves extra expense, but if one may judge from this mill, the results more than justify the expenditure.

The labor-distribution sheet for the mill, per shift of eight hours, is as follows: Shift bosses, 1 man; tipping floor to bins, 1; rolls, 2 (boys); raff wheels, 2; jigmen, 4; grinding pans and ball mills, 1; 18 Card tables, 2; central slimes race, 1; 20 tables and vanners, 2; spitzkasten attendant, 1; elevator floor, 1; trucker boss, 1; trucking concentrates, 1; trucking tailings, 10; slimes pump, 1; slimes retreatment, 3; horse driver (to dump), 1; vanner extension, 1 (and 2 boys); sampler, 1; total, 35 men and four boys per shift, or 105 men and 12 boys per day.

The boys receive about \$1 per shift, the bulk of the men, \$1.83 per shift; and those engaged on the pans, jigs and groups of concentrators from \$2 to \$2.50. Shift bosses are paid \$2.95.

MILLING AND GENERAL COSTS

The cost of dressing the ore, during the half-year ending March 31, 1908, was \$1.495 per ton of 2240 lb. The recovery of lead was 72.1 per cent. and of silver 40.6 per cent., the crude ore averaging 15.1 per cent. lead, 13.7 oz. silver and 18.7 per

cent. zinc. The general costs being as follows:

GENERAL COSTS AT BLOCK 10 MINE.			
		Per	
		Long Ton.	
Ore raising		\$2.720	
Transport of ore		0.067	
Ore dressing:			
Breakers	\$0.103		
Milling	1.232		
Slimes retreatment	0.140		
		1.495	
Total		\$4.282	

DIFFICULT ORE AT THE JUNCTION NORTH

Ore dressing at the mill of the Broken Hill Junction North Silver Mining Company is of more than usual interest, as the crude ore averages 40 per cent. rhodonite, which increases the difficulty of fine grinding and concentration. The specific gravity of the concentrates, which contain 10 per cent. of blende and 18 per cent. of rhodonite and garnet, varies from 5.9 to 6.2, while the specific gravity of the tailings ranges between 4.5 and 4.8. The working ratio in water, therefore, varies from 5.2 to 3.5 under the best conditions, and under the worst conditions from 4.9 to 3.8.

In order to obtain anything like satisfactory results from the concentrating tables they have to be run at high speed and with a long throw. The Wilfleys run 260 strokes per minute with a 1½-in. throw. Needless to say the tables suffer. T. H. Palmer, manager of the Junction North company, has designed a rubber vanner belt table for sand concentration. The rubber is claimed to exercise a sort of selective action on the metallic concentrates and in consequence it is possible to run the belts at a lower speed than the ordinary concentrating tables. These vanners, which have proved extremely economical in practice, will ultimately replace all the Wilfleys tables in the mill.

SEQUENCE OF MILL OPERATIONS

The ore milled averages 14.8 per cent. lead, 10.5 oz. silver and 8.7 per cent. zinc. Following is a brief account of the sequence of metallurgical operations. The ore is raised in trucks and after passing the weigh bridge, is dumped over 3-in. grizzlies. The oversize from the grizzlies passes through a No. 5 D Gates breaker. The undersize from the grizzlies and the product from the breaker pass over a shaking screen having 2-in. holes. The oversize is sent to another breaker, which reduces it to 1½ in. The final product is elevated on an 18-in. Robins belt conveyor to the mill bins. The belt is 400 ft. long, rises at an angle of 17.5 deg. and travels at 160 ft. per min. The conveyor has a capacity of 5000 tons per week. The mine output, however, averages only 1400 tons per week.

From the mill bins the ore is fed by means of roll feeders to four 3-deck shaking screens. The top grating is punched steel with ½-in. holes, the intermediate screen has 3 mm. holes and the third or

bottom screen has 0.75-mm. holes. The screens are actuated by "out of balance" flywheels and double buffers. They are said to do excellent work at low cost, but the vibration is very heavy. On concrete foundations this type of screen might be successful, but otherwise the vibration imposes a severe strain on the woodwork of the mill.

The oversize from the upper and intermediate screens is fed to two pairs of Cornish rolls, a choke feed being maintained. The rolls are 33 in. in diameter by 18 in. on the face. The tires of the flanged rolls are Krupp armour plate, but Cammel-Laird toughened steel is used for the plain rolls. The tires have a life of 15,500 tons and each pair of rolls has a maximum capacity of 1500 tons per week. Running at 23 r.p.m., the rolls require about 40 h.p. each. The product from the rolls is again elevated to the shaking screen and the product which passes the 3-mm. screen and is retained on the 0.75-mm. screen is sent to two May jigs.

MINERALS FINELY DISSEMINATED

The concentrates, which are obtained from the first two hutches of the jigs represent only 25 per cent. of the total lead recovered. The galena is in fine grains and in consequence the ore must be finely crushed before the bulk of the contained mineral is liberated. The middlings from the two jigs go to four 4½-ft. grinding pans and two No. 4 Krupp mills. The jig tails are sent to the mine for stope filling.

The product from the grinding pans and ball mills shows on sizing that 13 per cent. remains on 0.5-mm. mesh, 56 per cent. on 0.25-mm. mesh and 11 per cent. on 0.15-mm. mesh. This product is elevated and distributed, without classification, to nine Wilfleys and five sand vanners. The product that passes the 0.75-mm. mesh in the three-deck shakers is distributed to four Krupp vanners. The tailings go to the dump, together with the tailings from the other sand tables—the middlings to the grinding pans and the slimes to the settlers that receive the slimes from all the other tables. After thickening the slimes are passed over six slime vanners.

The mill is still in a transitional stage and costs and recoveries have recently been slightly improved upon. In particular the recovery of lead has been increased to 65.5 per cent., the lead recovery during the last half of 1907 having been 63.7 per cent. The silver recovery for that period was 45.1 per cent. The concentrates averaged 58 per cent. lead, 29.1 oz. silver and 6.2 per cent. zinc. On a weekly average of 1350 tons treated, the cost of dressing the ore was \$1.88 per long ton, but as the mill was working under exceptional disadvantages this cost is abnormal. During the same period mining cost averaged \$2.84 per ton, about 75 per cent. of this expense being for labor.

PRODUCTS FROM BLOCK 10 MILL.

Product.	Percentage by Weight.	Silver, Oz. Per Ton.	Lead, Per Cent.	Zinc, Per Cent.

cent. zinc. Other data concerning the mill products will be found in the accompanying table. During the period mentioned, 67,054 long tons of ore were

Mica Mining

A. S. ATKINSON*

Until quite recently, mica was one of the unimportant mineral products which mining engineers passed by without much more than a cursory investigation. It was only 10 years ago that I could have secured the option on Canadian mica deposits for an insignificant sum while now these same deposits yield an annual output valued at \$50,000. The change came when the electrical industry began to use mica in connection with electrical apparatus and, so rapidly has the demand increased that today mica mining is an industry of fair repute. In spite of the fact that we, as a nation, are the largest electrical manufacturing country on the globe, and the largest consumers of mica in the industries, less attention has been paid to the exploitation of the mineral here than in Canada, India and other countries.

It would seem as if this might be due to the fact that we have no great possessions of good mica to draw from but this is not borne out by the geological reports. We have valuable mica deposits in half a dozen States, notably in New Hampshire, North Carolina, South Dakota and Alabama. Recently very excellent deposits of phlogopite were found to exist in North Dakota and another rather extensive deposit of muscovite was unearthed in Tennessee. Biotite is found in considerable quantities in western Pennsylvania and Virginia.

MICA OF COMMERCE

In general there are three species of mica recognized in commercial uses. Muscovite, or potash mica, has a wide demand and when found in a pure state the crystals are nearly white with a slight yellowish tinge. It is in special demand for windows of lanterns and for stove doors. Biotite is known as black mica and is of magnesia-iron composition. It is found in deposits in this country and in Canada and while not suitable for all purposes, has a commercial value. Sometimes black mica belongs to the phlogopite or magnesia-aluminum variety, as this mica ranges in color all the way from amber and light brown to black. Both of these micas are of great value when found in large deposits, with good cleavage, and especially when obtained in large and nearly transparent sheets.

CANADIAN AND UNITED STATES MINING METHODS

The total output of mica in the United States averages scarcely \$100,000 per year, while that of Canada reaches nearly \$250,000 and India is accredited with a yearly output of nearly a million dollars worth of this mineral. The reason for the lat-

ter's supremacy in mica mining is found in the cheap labor costs of the country. The better facilities and modern methods of America should, however, more than overbalance this advantage.

In Canada and the United States, the methods of mining pursued show how far this infant industry has advanced over that of India. Mica is found in a great variety of veins or sheets, masses, dikes and lenses; the pegmatite occurs chiefly in the Laurentian formations. In open quarries the mica is taken from the surface rock in a simple way, but the work as a rule is interrupted by bad weather, so in New Hampshire where open quarries are worked, a portable tent or shed has been found useful to protect the workings. The power drill is used and also knives driven by compressed air which cut out the sheets in big masses so they can be easily split as needed. Underground mining is the more satisfactory method and is adopted where the deposits are sufficiently large to warrant extended work. A number of underground mines are worked successfully under improved conditions and the returns justify the investment. Where underground mining is to be adopted, the deposit should always be sampled with drills before extensive equipment for hoisting, etc., is put in.

The general method of opening up underground deposits is to sink a shaft and then open up the deposit at intervals of from 30 to 50 ft. Sometimes the mica is found only in small deposits and when one has been exhausted, drifts are run in several directions to find other pockets. These pockets as a rule, in a good mica, are close together, and a few tests with drills beforehand enable the miner to work with intelligence.

Hand drilling is often resorted to in order to prevent damage to the mica crystals. The holes are loaded with very small charges so that no great destructive work will be done by the explosive. The chief object is to loosen the rock and not blow up the mica. When the mica deposit is uncovered hand picks must be used. All sorts of power drills and blasting charges have been tried for mica mining, but in each case the work must be performed with care and in consideration of the conditions which prevail. In the past, in some cases, the rock was simply blasted out and then carried to sheds where the mica was picked. This, however, proved a very wasteful process as many fine sheets of mica were injured. Formerly the mica was split and trimmed by hand, but the modern method is to use machines and by them the output per man has been more than quadrupled.

COMMERCIAL CONSIDERATIONS

Mica sheets of unusual size and perfection always command special prices. In the Saguenay district of the lower St. Lawrence, and also at the Mattawa, north

of Ottawa, very fine large sheets of mica are found in the deposits. The mica appears in thick layers of dark rose color, which when split furnish some of the best sheets found. This district has not been thoroughly explored and new discoveries of good deposits are constantly being made.

Near the surface, mica is apt to be injured by water seeping through the rocks, which either discolors the mineral or renders it very friable and brittle. For this reason after a deposit has once been proved, it pays to work it by underground methods as the better quality of output insured will overbalance the greater expenditure necessitated. The surface discoloration and weathering do not usually extend to any depth.

Surface mining is, of course, cheaper on account of the smaller plant required and the simplicity in getting at the material. In underground mining at least 1250 lb. of mica must be extracted from every 100 tons of rock mined to make the work profitable, but in surface work if 800 lb. of trimmed mica can be obtained from each 100 tons of rock, the profits are satisfactory. In the Saguenay district as much as 3000 lb. of trimmed mica are obtained from each 100 tons of rock from underground mining and at some of the surface mines 2500 lb. are secured.

Many other considerations affect the cost of mica mining. In one mine in Canada a ton of fine mica ranging from 3 to 7 in. in size is mined at a daily expense of \$47 but in another mine the cost is \$170 for only 600 lb. These two mines probably represent the two extremes of cost. The variance is caused by differences of the deposits and supply, but it is not likely that the latter mine could be worked long if it were not that large, exceedingly fine specimens are obtained, which usually command high prices in the markets.

The average yield of many mines will probably show only 5 per cent. of mica sheets cutting 4x6 in. and 50 per cent. cutting 1x3 in. However, in such cases the supply must be large enough so that at least 600 lb. of trimmed mica can be obtained from 60 tons of rock at a total daily cost of about \$50.

The public has been slow to invest in mica mining, and in fact nearly all of the mines are operated by close companies which realize that a steady and uniform profit is more valuable than spasmodic abnormal yields. A mica mine is in no sense a wildcat, but a safe and sure investment if the conditions are thoroughly investigated before mining is undertaken. In many cases old abandoned mine dumps are now being worked over, for at present, scraps of fine mica can be marketed at a fair profit.

CONSIDERATION OF THE PHYSICAL PROPERTIES

The physical properties of mica greatly

*Mining engineer, P. O. Box 1189, New York.

affect its commercial value. Perfect transparency is one of the most valuable qualities and where this transparency is without any flaw, the returns from a mine are 20 per cent. higher. In some cases impurities have been deposited between the cleavage planes of the mica and in others the crystallization has been disturbed. In either case the transparency is seriously affected, and in most cases this defect cannot be eradicated. In some localities feldspar or quartz has been deposited between the cleavage planes. Where these impurities are in a loose condition they can be removed by a process of washing which does not injure the product.

Flexibility is another very essential characteristic and as mentioned above, mica mined from surface workings is apt to be soft and lacking in this respect. Where the mica is partially decomposed, it has little commercial value other than for use in paint.

Considerations of the quality of the mineral should always precede a decision to invest money in the exploitation of mica deposits. Failure to do this has resulted in many disappointments. This is just as necessary as investigating the nature of the deposit, for both are essential to success. While less expensive machinery is required for mica mining than for any branch of metal mining, the proper equipment of a plant demands quite a little investment of funds. Unless the supply and quality are going to prove satisfactory for a considerable time, it is unwise to undertake the work of opening an underground mine. Surface mining on the other hand may be undertaken without much risk.

Assaying Silver Bullion

F. T. C. Hughes (*Bull.* 41, I. M. M.) describes an interesting method of assaying silver bullion in use at the Indian mint. The method consists of dissolving the assay piece in nitric acid, precipitating the silver with hydrochloric acid and weighing the silver chloride formed. The work at the mint embraces the determination of the silver contents of fine silver, Mexican dollars, Chinese "lycee" silver, and various coins. In most cases granulated samples are taken of the melts as well as punchings from the coins. The assay-piece weight chosen is 18.821 grains, which weight of pure silver gives 25 grains of silver chloride. The 25-grain weight is the unit weight, and the other weights are decimal parts of it.

The assay pieces (*musters*) are carefully adjusted to weight, checked weighed, and placed in bottles. To each bottle 5 c.c. of nitric acid (sp. gr. 1.25) is added by means of a pipette, and the solution assisted by placing the bottles on a hot plate. The nitrous fumes are removed from the bottles after solution is complete by blowing into the bottles through a piece of glass tubing. The bottles are then removed from the hot plate and 150 c.c. of

cold distilled water introduced into each bottle, followed by the addition of 5 c.c. of hydrochloric acid (sp. gr. 1.075). The bottles are then stoppered, allowed to stand a few minutes and then shaken by hand, a final twist of the hand serving to wash down the sides and the stoppers. The bottles are nearly filled with a rapid inflow of water, settled for an hour when the supernatant liquor is removed by siphoning until about 1 in. is left in the bottom of each bottle. The bottles are again nearly filled with water, shaken and settled overnight, with the stoppers in place.

The stoppers are removed in the morning, the bottles inclined and tipped so that the chloride may collect on one side and inverted in a trough of water over small Wedgewood cups standing in white porcelain saucers. The finger is kept over the mouth of the bottle while inverting, but is removed before any of the chloride has touched it. The bottles are held by clips in their inverted position and are tapped and turned until all of the chloride has settled out. The finger is again placed over the mouth of the bottle and the bottle removed for traces of chloride.

The cups are removed from the trough and any particles of chloride in the saucers carefully transferred to their respective cups. The water is carefully decanted from the cups, tapping them meanwhile to collect their contents. The cups are next dried in hot-air ovens at 212 deg. F. until the cake of silver chloride shrinks away from the cup and can be readily loosened by means of a gentle tap. The temperature of the ovens is next raised to 350 deg. F., and maintained at that temperature for three-quarters of an hour. The cups are then cooled, the hardened cake removed with a pair of platinum-tipped forceps to the balance pan and rapidly weighed to prevent the absorption of moisture, which is liable to take place in damp weather.

The results are accurate, but the time and labor consumed are large. Gold, platinum, tin, antimony, bismuth, mercury and lead interfere in this method, and slight modifications are necessary when they are present. The silver is recovered from the silver chloride by melting the chloride with 70 per cent. chalk and 4 per cent. powdered charcoal.

Departure in Sheet-ore Mining in the Joplin District

By TEMPLE CHAPMAN*

The "sheet-ore" mines of the Joplin district are now developed continuously over a stretch of country about 10 miles in length, and a greater ore area is indicated. The workings about each mill usually cover an area of from 10 to 40 acres and the ore mined has usually been of a thick-

ness varying only between 8 and 12 ft. in height. This stratum has rarely been worked profitably when the average saving of zinc and lead concentrates amounted to less than 3 per cent. of the crude ore mined, and yet the general yield from all the sheet-ore mines runs but slightly over 3 per cent. The cost of this mining plus the 10 per cent. royalty paid by most sheet-ore mines is as great or greater than the receipts at present ore prices. Therefore the following departure in mining methods is important.

Recently several of the "sheet-ore" mines have sunk deeper into the "sheet" and have taken up a "12-ft. stope" (the floor of the mine). From this operation the yield of concentrates has hardly averaged 2½ per cent. of the tonnage of crude ore mined, but the cost of mining has been greatly reduced and the grade of the concentrates has been high (63 per cent. zinc). Where in the heading to air drills and \$100 worth of dynamite daily were required to "break" 500 tons of rock, in the stope one machine drill and \$20 worth of dynamite are doing the same work and keeping a big mill busy day and night.

In the Red Dog mine at Webb City, Mo., we are taking up a "second stope" or third level, showing the sheet orebody to be approximately 30 ft. in thickness in all. In the accompanying illustration above the white crosses will be seen the stratum of disseminated lead and zinc ore originally worked by all the sheet-ore mines, this original level usually having a height of 10 ft. Below this will be noted the two strata indicated by the four white crosses which mark the second level or "first stope" now operated by a few of the Webb City mines. Still lower is the "second stope" or third level opened in the Red Dog mine where the entire thickness of the "sheet-ore" body was first worked. The photograph shows the wonderful regularity of the stratification. There are four main strata each about 8 ft. thick, which consist of (1) the richer, disseminated zinc and lead ore; (2) a more or less barren stratum of white flint; (3) a good grade of zinc ore contained in two regular seams; (4) a disseminated and pockety lead ore. Each main stratum is of a distinct color and different formation from each of the other three.

Above the ore, extending to the surface, is a body of limestone 200 ft. in thickness, while under the ore and going down to the sandstone is the second limestone 200 ft. thick, so our new development shows that the entire flint stratum between the two limestones is mineral-bearing and probably "pay ore." It also indicates the possibility that 30 ft. is the workable thickness of the sheet-ore body throughout its area in this district. The amount of ore that might be mined from a 40-acre tract, leaving enough pillars for holding the roof, would be 3,000,000 tons, and the yield in zinc and lead concentrates, at 2½ per cent. saving, would be 75,000 tons.

MINING THE ENTIRE SHEET-ORE BODY AT RED DOG MINE, WEBB CITY, MO.

Ore Handling Bridge at Duquesne Steel Works

The Duquesne Bridge Has a Span of 230 Ft. with a Cantilever Extension of 65 Ft. at Either End; Capacity Exceeds 600 Tons per Hour

At the Duquesne plant of the Carnegie Steel Company a large ore-handling bridge has recently been installed which possesses a number of interesting features. The bridge spans an ore yard of about 1800 ft. in length, serving six large blast

The bridge is of approximately 230 ft. span between trucks, and has a cantilever extension at either end of about 65 ft. The iron ore is brought within reach of the bridge by transfer cars, which operate between the car dumper and the ore yard

moves it from the storage pile and delivers to transfer cars for distribution into various compartments of the bins, from which the supply for the blast furnaces is drawn as needed.

At the farther end of the bridge a V-

GENERAL VIEW OF ORE-HANDLING BRIDGE AT CARNEGIE STEEL COMPANY'S PLANT, DUQUESNE, PENN.

HANDLING ORE AT YOUNGSTOWN, OHIO, WITH A HEYL & PATTERSON BRIDGE

furnaces. Adjacent to the furnaces are storage bins under which the larry cars operate to conduct the ore from the bins to the furnace skips. One supporting leg of the bridge rests on this bin structure, and the other is carried by a concrete wall 26 ft. high.

and run on tracks carried by the bin structure. These transfer cars discharge their load through an open track on baffle plates, which form a temporary pile along the bin side of the storage yard. By means of the grab bucket the bridge gathers up the ore and places it in storage or re-

shaped leg furnishes the support but at the furnace end, a single shear leg supports the bridge as is shown in the accompanying illustration. Throughout the design of this structure flexibility was sought; this provides for the inequalities in travel of the two ends of the bridge,

and absorbs endwise shocks and thrusts due to the quick acceleration of the trolley, without straining the bridge.

The bridge is propelled along its track by two 52-h.p., Westinghouse, type K, crane motors; a motor is placed on each truck and is controlled from the cab. The two controllers for these motors are set adjacent, and are so arranged that a single handle moves either controller separately or both simultaneously. This arrangement allows one end of the bridge to be moved without affecting the other, and on a long travel should one end of the bridge structure get in advance of the other end, the higher-speed motor will be retarded until the slow one overtakes it.

On this bridge is used a 10-ton Hulett patent excavating bucket, which is operated by two 225-h.p., Westinghouse, crane motors of mill-type construction. The bucket with its load of ore weighs approximately 50,000 lb. The trolley traversing mechanism is driven by a 225-h.p. motor of the same type as the hoisting motors. The two bucket-operating motors are geared together and operate by a single magnetic-type controller, providing also for dynamic braking. This relieves the trolley of a considerable item of wear in the matter of brake blocks. The bridge is of large capacity, having been constructed to handle 600 tons per hour. It has, however, within the last four months far outstripped this amount. The bridge was constructed by Heyl & Patterson, Inc., of Pittsburgh.

At Youngstown, Ohio, an ore-handling bridge of much the same type, but of approximately 100 ft. greater length has been installed at the plant of the Youngstown Sheet and Tube Company. This bridge is shown in operation in one of the accompanying engravings. The propelling gear differs from that of the Duquesne bridge in having four motors instead of two, the trucks at the four corners being in this instance duplicates.

these are either removed during the analysis or do not react with the thiosulphate.

In the standard thiosulphate solution, 1 c.c. = 0.005 gram of arsenic and is standardized either against copper or arsenious oxide. In standardizing with copper, 0.3 gram is dissolved in 10 c.c. dilute nitric acid, the fumes boiled off, ammonium hydrate added till just alkaline, any excess boiled off and 1 c.c. of glacial acetic acid added. The solution is cooled, potassium iodide added and the free iodine titrated with the thiosulphate. The arsenic value is $75/127.2$ of the amount of copper taken.

The standardization with arsenious

to take 0.5 gram of the ore in a 12-oz. tumbler beaker and treat with 10 to 15 c.c. of a moderately strong solution of potassium chlorate in concentrated nitric acid. The solution is evaporated to gentle dryness and then heated for a few minutes to get rid of oxidizing matter. After cooling and adding 10 c.c. of dilute ammonium hydrate, the solution is brought to a boil, 25 c.c. of sodium hydrate (25-per cent. solution) added, boiled again, filtered hot and washed with hot water. If the volume exceeds 50 c.c. it should be evaporated to that bulk and then neutralized with concentrated hydrochloric acid and treated as in the standardization.

DETAILS OF V-SUPPORT OF ORE BRIDGE AT DUQUESNE, PENN.

Rapid Estimation of Arsenic

Harley E. Hooper (*Bull.*, 41, I. M. M.) describes a rapid method for the estimation of arsenic in ore. The method is based on the reaction between arsenic, when present in its higher form of oxidation, and potassium iodide in an acid solution. The iodine set free by the reduction of the arsenic is titrated with standard thiosulphate solution. The method is suitable for sulphide or oxidized ores containing 1 per cent. or more of arsenic and is free from interference by the other ordinary constituents of ores, such as lead, copper, zinc, iron, manganese or nickel, since

oxide is made by taking 0.264 gram of the pure salt, adding 5 c.c. of concentrated nitric acid, evaporating to dryness and heating strongly for a few minutes, then taking up the residue with 25 c.c. of a 25-per cent. sodium-hydrate solution, warming and diluting to a bulk of 50 c.c. The solution is neutralized with concentrated hydrochloric acid, 25 c.c. more acid added in excess, then cooled, the potassium iodide added and the titration performed with the thiosulphate. Starch is not used as an indicator during the titration, but after the solution is colorless, starch is added as a test of the completeness of the titration.

The method for a 20-per cent. ore is

The proportion of hydrochloric acid present should be from one-half to three-fifths of the total volume. The titration should be done slowly, especially toward the end and if the yellow color returns a few drops of thiosulphate will discharge it, and the higher reading should be taken. The method is altered when antimony is present by fusing the ore with sodium peroxide in a nickel crucible and extracting the fused mass with water. Starch as noted before should not be used as an indicator during titration but only to confirm the end point and if any color is shown the analysis must be repeated. For careful work, blanks should be run to test the reagents.

Restoring Dredged Ground*

In the State of Victoria, Australia, much gold is obtained by hydraulicking and dredging. In 1907 there were 133 dredging plants in operation, 45 of these being bucket dredges, 84 pump-hydraulic sluices, and four jet elevators. In 1907 these plants treated 20,199,892 cu.yd. of material which yielded 97,821 oz. gold, or an average of 2.32 grains per cu.yd. of gravel treated. In this industry 2468 men are employed. Three of the bucket dredges treated more than 9000 cu.yd. a week; four, more than 8000 cu.yd.; and 17 dredges between 6000 and 7000 cu.yd. a week. In many respects dredging is in a more advanced state than in most other districts, for in Victoria an attempt to restore the dredged area to usefulness for agricultural purposes is being made and meeting with some success.

THE SAND LAUNDRER ORDINARILY USED

One of the features of the year has been

in it, held down by battens and cleats. The area of the extra gold-saving surface is about 120 sq.ft. About one-twenty-fifth of the gold is saved in the sand launders, this being the finest gold in the gravel.

In bucket dredging when the gravel contains much clay, difficulty is experienced in saving the gold, for the balls of clay which are not broken up carry considerable gold into the tailings. This difficulty has been overcome to a large extent by the use of a revolving screen, inside of which are heavy iron chains hanging in loops and bunches. This screen works longitudinally around a fixed iron bar attached to which are spikes or teeth spaced about 6 in. apart. These teeth act as a paddling rake, and the loose-fitted, dangling chains agitate and break up the coarse lumps of material as the screen revolves.

RESTORING THE DREDGED AREA TO USEFULNESS

As has been said before, considerable attention is being given to the reclaiming of dredged ground. The sand boxes de-

ft. An opening, 5 ft. long, extends from the lower end of the main box to the upper end of the extension loam launder; during ordinary dredging operations while the special loam chute is not in use, the gravel discharges through this opening.

THE LOAM LAUNDRER FOR RESOILING GROUND

The upper end of the extension loam launder, Fig. 2, is as wide as the main launder, but within a short distance the width is reduced to 26 in., the depth being 9 in. The movable portions of the launder *E* and *F* are made of $\frac{1}{8}$ -in. plate, bent into a semi-circular trough; a light angle iron is riveted along each of the upper edges to form flanges. When the chute is in position for use, these flanges rest on top of the upright sides of the main sluice box. Sections *E* and *F* of the loam launder, when in operation, extend along the inside of the main sluice box from near the bottom of the drop-chute bars to just across the 5-ft. opening, bridging the latter and conveying the resoiling material

FIG. 1. TYPE OF TAILINGS LAUNDERS USED IN VICTORIA, AUSTRALIA

the tendency for bucket dredges when working in suitable ground where the material is of a loose, friable, sandy nature to discard screens and elevators and to use instead riffle-bottomed sluice boxes such as are shown in Fig. 1. This latter method is more economical both in regard to initial cost and to maintenance, and by the adoption of a simple contrivance (the silt distributor) the dredged material is classified so that the fine sand is deposited on top, partially restoring the dredged area to usefulness. But the main advantage of these launders is the additional saving of gold obtained rather than the restoration of the area, for as none of the water is removed from the dredged material the silt is carried deep into the gravel, and so the best part of the soil is lost. These sand launders are laid with cocoa matting placed under protecting sheet iron having $\frac{3}{4}$ - or 1-in. openings

scribed above are not especially suitable for this work, but at two plants, the Constance dredge at Eurobin, on Owens river, and the Tullock's dredge on Livingston creek, Omco, satisfactory restoring devices are being used, while the Crooked River company has recently started to use similar contrivances. In any restoring process advance stripping is necessary in order to keep separate the surface soil and in order to enable the dredging to be done with as little water as possible, so that the fine silt will not be carried down into the underlying coarse gravel.

The method used with the Confidence dredge consists in working the gravel and surface soil separate. The gravel is deposited near the dredge, while the soil, which is stripped before the gravel is touched, is conveyed farther and is deposited on a part already covered with gravel. On the Confidence dredge the main sluice box is 4 ft. wide by 18 in. deep, and its length from the drop-chute bars to the end of the delivery is 56½

into the extension loam launder which deposits approximately the same thickness of soil on top of the gravel as was originally there. The upper end of section *F* is made rectangular, and of such size that it fits into the main sluice box near the drop-chute bars. The portable sections *E* and *F* are raised and lowered by a continuous wire rope extending from a winch on the dredge framework. This rope goes from the chain strap around the end of section *E* through a small pulley *H*, fastened to a rope passing from the head of the derrick to the aft gantry; then it passes through a double pulley suspended on the before-mentioned line, and is next taken through another small pulley *L* on the framework of the dredge to the drum of the winch used to raise or lower the loam launder. The operation of raising or lowering occupies only three minutes; the whole time from the stopping of gravel dredging to the delivery of loam from the buckets into the launder is about 10 minutes. When being raised the

*Abstracted from the report of D. B. Sellers, State hydraulic engineer, in the Report for 1907 of the Secretary of Mines for Victoria, Australia.

shorter and lighter section *F* rises from the main box first, and continues to ascend until blocked by the stops at *G G*. Then the upper end of *E* begins to rise and is hoisted to *H*, where it is held in position until again required. While dealing with surface soil or loam, sections *E* and *F* are lowered each morning into their place inside of the main box, and advance stripping is done for two or three hours.

ADVANTAGES OF THE SYSTEM

During that time, with a face from two to three chains long sufficient ground is stripped to admit of gravel dredging for the remaining portion of the 24 hours. The soil is stripped at the rate of about 85 cu.yd. per hour; the gravel is dredged at the rate of 60 cu.yd. per hour. Allowing for delays, in a week's run of 130 hours about 100 cu.yd. more of ground can be dredged, and in the case mentioned more gold can be saved by separately stripping and conveying the overburden through the loam launder than by sending both gravel and overburden together

Assaying Stamp Mill By-Products

Much has been written concerning the assaying of ores and usual metallurgical products, but there has been published comparatively little regarding such by-products as battery chips and screens, plumbago crucibles, drosses, etc. The methods described by Leslie J. Wilmoth (*Journ. Chem., Met. and Min. Soc. of South Africa*, VIII, pp. 230-232) for the assaying of by-products were indirectly the result of some experiments on the assaying of copper ores for gold. An almost pure carbonate of copper ore was mixed with a gold ore in such proportions as to contain 8 per cent. copper and 35 dwt. gold per short ton.

OBJECT OF THE EXPERIMENT

The object of the experiment was to collect the gold in a lead button and pass the copper into a gold free matte by adding sufficient sulphur to the charge to unite with the copper. The charge used was: Ore, 1.0 a.t.; granulated soda, 2.0;

The silica was used to protect the crucible and it seems as though an excess of flux was used. The nail served the same purpose as in the ore assay. The charge is given a hot quick fusion and then washed down with a small amount of litharge and charcoal. The heat used is a little higher than with the usual assay, and after the fusion has become quiet the crucible must stand in the furnace for a full twenty minutes. The method is excellent for gold, but when silver is to be determined, the matte should be re-run by scorification.

The sample of battery screens consisting of small clippings of the screens is carefully oxidized in roasting dishes in the muffle until all the iron is in the oxide condition. The roasting dishes are then removed from the muffle, cooled and their contents pulverized using care to avoid losses during the operation. The sample may then be assayed by the usual methods or by the matte method. The basic character of the slag tends to a loss of gold in the slag with the usual methods, and

FIG. 2. CROSS-SECTION OF CONFIDENCE DREDGE, SHOWING LOAM LAUNDERS RAISED

through the sluice box. The cost of stripping the soil and dredging the gravel is about 2d. per cu.yd., the area re-soiled being six acres.

Water is required to wash the soil along the launder, but in practice it is found that only about 10 per cent. of the quantity necessary to keep the sluice box clear of ordinary gravel is sufficient to convey the loam through the re-soiling launder. By the exercise of a little care and by building small brush and stone dams, the quantity of loam that is carried back to the pit by the return water can be reduced to moderate limits. Some soil drops into the pit when scooped up by the buckets, and some soil goes away in suspension at the save-all box, so that all the soil cannot be deposited again on top of the gravel. Nevertheless, the Confidence dredge is at present replacing from 80 to 85 per cent. of the surface loam on top of the dredged gravel so that the re-soiled gravel is almost as useful for grazing and agriculture as originally.

fused borax, 2.0; litharge, 1.0; sulphur, 1.2 grams; charcoal, 1.5 grams; one 6-in. iron nail. The iron nail took up any excess sulphur and kept the lead button malleable. It was found that the lead collected all of the gold and the matte was practically gold free.

The method was so successful that it seemed applicable to the assaying of battery chips. The sampling of battery chips is at the best very unsatisfactory and when to this is added equally unsatisfactory methods of assaying, the perplexity of arriving at the true value of a lot can be imagined. It was desired, therefore, to remove one of these perplexities by devising a suitable method for this material, which consists of lumps of iron ranging from the size of a pin head to lumps 0.5 inch in diameter. The matting method was successfully applied to the battery chips using: Chips, 1.0 a.t.; granulated soda, 1.5; fused borax, 1.5; sulphur, 0.5; silica, 0.5; charcoal, 1.0 gram; iron nail.

Mr. Wilmoth, therefore, prefers the matte method. The charge for the direct fusion was: Oxide, 1.0 a.t.; granulated soda, 1.5; fused borax, 1.0; litharge, 2.0; silica, 0.5; charcoal, 1.5 grams. The charge used for the matte method was: Oxide, 1.0 a.t.; granulated soda, 1.0; fused borax, 0.5; litharge, 1.0; silica, 0.5; sulphur, 0.5; charcoal, 1.0 grams; one nail.

According to Consul John E. Kehl, a local railway company has acquired a large tract of land at East bay, about 15 miles from Sydney, Nova Scotia, which is said to contain large deposits of gypsum. The deposits will be thoroughly exploited by the present owner, with the assistance of government experts. Tests already made point to an exceptionally large quantity of material of unusual purity.

According to the *Journal Soc. Chem. Ind.*, March 31, 1909, a small percentage of copper in lead has little or no influence upon the reaction of lead with nitric acid.

An Investigation of the Cost of Mining Coal

Actual Operation Costs Are Analyzed, and it Is Shown That the Rate of Wages Is an Effect, Not a Cause, in the Economy of Mining

B Y J. R. F I N L A Y *

Modern civilization is propelled by the annual combustion of upward of 1,200,000,000 tons of coal. This vast use of power other than human or animal muscle is the basic fact in the mightiest revolution in industry, in art and in habits that the human race ever experienced. Every time we press a button to turn on an electric light, every time we enter an elevator or a street car we participate not only in a human revolution, but in a great geologic fact; for the mining and destruction of coal removes some of the important strata of the earth's crust.

Coal mining is the basis and dependence of other kinds of mining just as it is of other industries. And farther, since coal mining is one of the simplest and commonest of mining operations, it serves as a standard by which the complexity and cost of other kinds of mining may be appraised.

If coal were not so abundant and widespread its use could not, of course, be so extensive and fundamental. The fact of its wide distribution is the most powerful element in the conduct of the business. If coal were not cheap it could not be so extensively used; it would not, therefore, be so valuable. But because it is cheap it is often wasted; it is cheap because it can be offered in the market by innumerable competitors, whose aim is not the wise use of coal, but ready money profit from it. Hence this most valuable of mineral resources has been in considerable measure crudely and greedily exploited.

The cost of coal to the consumer depends on two elements that vary widely: 1. Mining, and 2. Transportation; but since the effect of the latter is self-evident, I do not propose to discuss it.

FACTORS THAT INFLUENCE COST OF MINING

1. The cost of mining coal depends, in my judgment, upon the following factors:

- (a) The thickness of the seam.
- (b) The purity of the coal in the seam.
- (c) The regularity of the seam.
- (d) The geological attitude as regards angle of dip occurrence of faults, etc.
- (e) The climate, cost of living, etc.
- (f) The depth.
- (g) The amount of water to be pumped.
- (h) The solidity of the roof.
- (i) The presence of gas, dust, or other elements of danger.
- (j) Topography of the surface.

Some other factors may influence the

cost in a minor degree. Such as the hardness of rock encountered in development work, hardness of coal, cost of supplies, etc.

It will be noted that I have mentioned only natural conditions leaving out the factor that many would be inclined to place first on the list—the rate of wages. I do not believe that this is a factor at all. The price of labor is determined by the natural factors. It is an effect, not a cause, in the economy of mining. If we have two neighboring districts with the same natural advantages, but in which the rates of wages are different, that difference is apparent, not real. The difference will be equalized by the supply and demand for labor as automatically as water runs down hill. If a mine pays lower wages than its neighbor it will have poorer men; if other conditions are the same, the cost will be the same. You cannot change this natural law; it is like the force of gravity.

LABOR COSTS AND WAGES

I hope that no one will understand this dictum to mean that where natural conditions are the same, the wages will be the same, or that the cost of labor will be the same; on the contrary, these things vary a good deal. Management, scale of operations, appliances of all kinds vary, or may vary, almost without limit among various enterprises. These factors help to establish wages and labor costs; they are quite independent both of natural conditions and of labor conditions, and have to do with the success or failure of enterprises. They introduce variations in cost that are, or may be, equal to the margin of profit that there is in the business.

HOW LABOR COSTS MAY DIFFER WITH SAME RATE OF WAGES

To elaborate a little, let us suppose that Smith and Jones are two rival operators in neighboring coal mines in which the natural conditions are exactly the same and in which coal is salable at \$1 per ton. There are only two mines in the district and each can produce twice its actual tonnage. Smith is a good operator, with sufficient capital, equipment, development and ventilation. He can mine coal for 60c. per ton. Jones is a poor operator, and his mine is poorly opened. It costs him \$1 per ton to produce coal. It is obvious that the successful and opulent Smith has the decision as to how great a difference there shall be in labor costs in that district. He can prevent Jones from making a

profit, and can close him down by selling coal under \$1 per ton, which is Jones' cost. It is obvious that the difference between labor costs here will be approximately as 6 is to 10. This is not due to the rate of wages; it is just the difference between Smith and Jones.

HOW WAGES MAY DIFFER AND COSTS BE THE SAME

Now let us suppose that Smith and Jones are 2000 miles apart and each sells his coal at a point midway between them with equal transportation costs. Smith can supply the market and so can Jones, and each wants to sell all he can, and can produce all he can sell. Smith can sell without loss as low as 60c. per ton. Jones, if he pays as much wages as Smith, cannot sell for less than \$1. Neither Jones nor his employees know anything of Smith's superior methods and appliances, and they have no means of living except by selling coal. Obviously under these conditions there is only one thing to do—work for less money. So Jones fixes his wages at 60 per cent. of Smith's wages and continues business. This rate is fixed by the efficiency of Jones as against Smith. His men get just what they earn. In other words, the final result is exactly the same as if each laborer were in business for himself.

ACTUAL COSTS

Returning now to the natural factors that govern the cost of coal mining, the fact that their number and importance is very considerable, and if all coal were to be mined we should have enormous differences of cost. As a matter of fact, these great differences do not at present exist because the commercial conditions of the country cause the elimination of all mines except those favorable for cheap working. This results from the fact that there is in this country, according to the U. S. Geological Survey, 2,000,000,000,000 tons of coal of all kinds easily accessible. This coal is spread over an area of 500,000 sq.m., and may be attacked at many thousand favorable points. The unfavorable seams will have to wait to be worked after the better ones are exhausted.

PRICE OF COAL AT MINES

According to the excellent review of the "Production of Coal" for 1907, published by the U. S. Geological Survey, the extreme variation in the price of coal at the mines in the various States is only from 90c. in West Virginia to \$4.10 in Idaho.

*Mining engineer, 2 Reector street, New York City.

The last figure is for only 7500 tons, and doubtless represents a case where an isolated but unfavorable seam may be worked because high transportation charges prevent the introduction of coal from other places. Leaving out such abnormal cases and considering only States where the output reaches 1 per cent. of the production of the country we find that the price of bituminous coal at the mines varies only between 90c. for West Virginia to \$1.68 for Arkansas. Pennsylvania anthracite is valued at \$1.91, but I shall explain later that the cost of anthracite is radically different from that of bituminous coal and no comparison should be made except with very careful explanation.

It is probable that the figures of average price of coal at the mines give the best general idea to be had of the cost of mining throughout the country. The price, of course, exceeds the cost, but it can be confidently asserted that the difference is not over 10 to 15c. per ton, if we consider the whole output of States. Within given fields there must be considerable variation; some mines working cheaply and with large profits, while others have no profits at all and some, if all capital charges were correctly made against them, would be found running at a loss. But it is quite obvious that the entire industry cannot run at a loss and that the average complete cost must fall inside the average selling price. It is difficult to get specific figures that will illuminate the general subject as accurately as the broad figures published by the Survey and I doubt if we can form a better idea of average costs than by assuming them to be 90 per cent. of the selling price. This assumption gives us the following for bituminous coal:

SELLING AND COST PRICES OF BITUMINOUS COAL.

	1903.	1904.	1905.	1906.	1907.
U. S. price	\$1 24	\$1 10	\$1 06	\$1 11	\$1 14
Cost	1 11	0 99	0 95	1 00	1 00

United States average price for 5 years, \$1.13; estimated cost, \$1.00.

	1907 Price.	Esti- mated Cost.
Pennsylvania.	\$1 03	\$0 93
West Virginia	0 99	0 90
Maryland	1 29	1 08
Virginia	1 02	0 91
Kentucky	1 06	0 95
Illinois	1 07	0 96
Alabama	1 29	1 17
Arkansas	1 68	1 26
Colorado	1 40	1 40
Wyoming	1 56	1 40
Utah	1 52	1 37
New Mexico	1 49	1 31
Washington	2 09	1 88
Idaho	1 80	1 62

These costs are intended to be complete, that is, to cover both operating and capital charges. I shall endeavor to give some reasons for believing them to be fairly accurate, but first let me disavow any intention of applying them to any particular property or district. It would be more enlightening, possibly, to take some detailed statements of costs and

compare and digest them. But such statements are hard to get and I must confess that those I have been able to secure are open to grave question as to their accuracy. For instance, I have the statements of a coal company operating three different mines. Detailed statements of operating costs for each month for each mine are given for a period of years. The aggregate tonnage and total operating cost may be figured out only with great labor. To get five years' operation averaged, I should have to combine 180 different cost statements. If this were necessary to secure the facts, one might be heroic enough to do it, but, after all, it would only give the results of an insignificant fragment of a single field and a single management. But far worse than this, after making this compilation, I should still doubt its accuracy because a single glance at the balance sheet reveals the fact that in mining 1,000,000 tons of coal, \$350,000 has been added to capital charges. The writing off of such charges is a matter of judgment, based on familiarity with the property itself. I cannot possibly supply either the time or the experience required to form a judgment of my own as to this rate of depreciation, and yet, in a business of narrow margin like that of bituminous coal, it is a matter of great importance whether 1c., or 5c., or 15c. per ton must be added for depreciation.

It is interesting to note that E. V. d'Inville, in his article on "Estimated Costs of Mining and Coking" (*Trans. A. I. M. E.*, Vol. XXXV, 1905) shares the same difficulty in arriving at true costs for coal-mining operations. He expresses himself as follows: "The cost of coal delivered to an oven, and the cost of the manufactured product, depends largely upon individual judgment or practice, and on general management. Therefore, without having access to the accounts of a number of individual mines, it is not possible to do more than approximate the average regional cost of mining coal or manufacturing coke. . . . For, though each plant in a district may be mining upon the same scale of wages, the computation of net mining costs may differ to a considerable extent in two adjoining plants, due to different methods of book-keeping, to a difference of opinion as to what items are properly chargeable to mining account and to capital account, or to physical difference at the two mines."

Mr. d'Inville's goes on to estimate the real cost of mining and coking at Connellsville and at Reynoldsville, Penn., the first a slope mine, largely self-draining, on a seam capable of producing 9000 gross tons (10,000 short tons) to the acre; the second a shaft mine where considerable pumping will be required and capable of producing 7200 gross tons (8000 short tons) per acre. His estimate per gross ton is as follows:

Mining Cost.	Coal.	Roys. alty.	Total.
Reynoldsville	\$0 66	\$0 86	\$0 04
Connellsville	0 34	0 52	0 08

Reducing this to a short-ton basis we find that Mr. d'Inville's estimate of total cost is:

Reynoldsville	\$0c.
Connellsville	33c.

These figures are for January, 1904. I find that for that year the average price of bituminous coal in Pennsylvania is reported at 96c. My arbitrary estimate for cost of 90 per cent. of the price gives us 86c. for that year. Now, since it would seem that the Reynoldsville mine represents conditions not far from average in the Pennsylvania bituminous-coal regions, it appears that the difference between my estimate and Mr. d'Inville's estimate is not so great, but that it might all be covered by a difference of judgment between two men in "what is chargeable to operating account."

PITTSBURGH COAL COMPANY

The reports of the Pittsburgh Coal Company, which operates 60 mines in the neighborhood of Pittsburgh, so situated that they must represent nearly average conditions for the Pennsylvania bituminous field, show the following: The average number of short tons mined per acre is 7000. Net profits for 8 years average 13.8c. per ton. The total cost for all capital charges is 16.2c. per ton. If we assume that the U. S. Geological Survey figures for the value of coal at the mines will hold good for the Pittsburgh Coal Company, we get the following, per short ton:

Average price of coal for 5 years.	\$1 03
Cost—Capital charges 16 2c.	
Operating	0 892
Profit	0 138
	\$1 030

Similarly the Monongahela River Consolidated Coal and Coke Company, also operating near Pittsburgh, with an extraction of 8000 tons per acre, shows the following for 9 years:

Assume price of coal as before	\$1 03
Cost—Capital charges 0 17c.	
Operating	0 91
Profit	0 12
	\$1 03

CAPITAL CHARGES

Without going into further tables of figures I find that in Pennsylvania the capital charges may be calculated as follows: A charge of 5c. per ton is made arbitrarily to cover the depletion of coal lands. If the property is bonded, this 5c. per ton is put into a sinking fund to retire the bonds.

In addition, current interest must be paid on capital or bonds. This charge will be in some proportion to the amount of unmined coal lands held for the future. Thus, if a company has a coal reserve for

100 years on its capital account, its interest charges must be greater than if its reserves are only enough for 20 years.

It appears that it requires approximately \$1 per ton of annual product to equip a coal mine for operation. Thus, for an output of 1,000,000 tons per year \$1,000,000 will be needed for plant and equipment. The renewal or depreciation of this plant will cost 6 per cent. per year.

In summary, then, we have:

For coal in the ground	5c.
For interest on \$1. capital	5c.
For depreciation of same capital	6c.
Total	16c.

It is self-evident that the operating costs will vary more than capital costs; probably about in proportion to the total. Thus, if we find at one mine total costs of 96c., of which 16c. is for capital and 80c. for operating, we would probably find that at another mine where the total cost is only 72c., the cost would be 60c. for operating and 12c. for capital. My reason for believing this is that a mine that is cheap to work must also be cheap to open.

While I am inclined to think that under present or recent conditions, the average cost of bituminous coal in Pennsylvania is 90c. or more, there is reason to believe that some of the most favorable mines work much cheaper.

Mr. Gary, in his recent testimony before the Ways and Means Committee on tariff revision, states that the cost of coke at the ovens, presumably at Connellsville chiefly, was in 1906, \$1.75 per ton, on which there was 54c. profit. This reduces the cost of coke to \$1.21. If the burning of the coke costs 31c., we have left 90c. for the coal, of which 1½ tons are required per ton of coke. This figures the cost of coal at the mines of the U. S. Steel Corporation down to 60c. per ton. Presumably this includes a sufficient allowance for depreciation. If so, the cost seems remarkably low and probably represents the cost of bituminous coal under the most favorable conditions. At any rate it agrees pretty well with Mr. d'Invilliers' figures for a representative Connellsville mine.

Certain other figures given by Mr. Gary about costs are of interest. He says that wages of all classes at coal and coke plants belonging to the U. S. Steel Corporation in 1908 averaged \$2.39 per day. Now at coal mines labor is usually about 75 per cent. of the total expense; we may, therefore, calculate that the whole cost per man per day is about \$3.20. If coal is mined for 60c. per ton there must be an output of about 5¼ tons for every man. In the State of Pennsylvania at large, the output is only 3.6 tons per man. If this output is obtained at a total cost of \$3.20, then the cost per ton is 80c. This agrees with my other figures for Pennsylvania.

Let us apply this reasoning to other coalfields and see how close it brings us to

my estimate of cost at 90 per cent. of the selling price.

In Michigan the wages are undoubtedly about the same as in Pennsylvania. I have estimated the cost of Michigan coal at \$1.62 per ton. The output per man per day is \$2.11. If we divide \$3.20 by this amount we get \$1.52.

Again, in Wyoming I am informed that wages of coal miners average about \$3.60 per day. If this is 75 per cent. of the whole cost per man, that cost is \$4.80 per day. The output per man averaged in 1907, 3.42 tons; the cost per ton, therefore, should be \$1.40. This is exactly my estimate by the 90-per cent. rule.

I have no information as to the average wages of coal miners in Colorado, but some light can be had on costs there from another source. The average value of coal at the mines in that State in 1907 is given at \$1.40. My 90-per cent. rule gives a cost of \$1.26. The Colorado Fuel and Iron Company mined that year about 4,500,000 tons of coal at a profit of \$900,000, or 20c. per ton. This profit was not altogether on mining since some of the coal was sold at a distance from the mines. Besides this the profits were diminished by certain fixed charges, of which the exact proportion belonging to the fuel department is not clear. At any rate it seems that the net profits on coal from mining were not over 10c. If, then, the U. S. Geological Survey is right in its average price of coal, the actual cost must have been about \$1.30.

Following are some more detailed figures on the cost of operating a slope mine, self-draining, in Virginia. The figures are complete in all respects except that of depreciation. I am in doubt whether that item is fully taken care of, but having no means of forming an individual opinion, I cannot express one. The seam averages 7 ft. thick:

	\$0.702	\$0.770
Tons mined	240,371	221,552

It is interesting to note the increased cost in 1907 over 1906, due to the unhealthy pre-panic business conditions.

COKE MANUFACTURE AND ANTHRACITE MINING

The production of commercial anthracite is so different a problem from that of mining bituminous coal that its cost is nearly parallel to that of coke. Run-of-mine anthracite is worthless for fuel. It will not burn unless it is carefully sized. It will not burn if there is even a moderate mixture of slate or bone in it. The sizing and rejection of impurities necessitates careful crushing, sizing and washing. It is distinctly a process of concentration as well as of sizing, for the loss in the "breakers" will average fully one-third of the run-of-mine tonnage. The cost of concentrating, or operating the breakers, is from 30 to 50c. per ton shipped—not cheap milling by any means, and no doubt mining men not acquainted with the fact will be surprised at it. The comparison may be tabulated as follows:

	Coke.	Anthracite.
Tons run-of-mine per ton	1½	1½
Cost of manufacture per ton	30c. to 60c.	30c. to 50c.

Several instances of actual figures for coke have come to my attention. Mr. d'Invilliers calculated average results at two Pennsylvania points for five years ending 1903 as follows:

CONNELLSVILLE REGION PLANT OF 500 OVENS.

Coal, 1½ tons, at 56c. net ton	\$0.840
Charging, leveling, drawing and labor	0.326
Salaries, supplies and depreciation	0.050
Total	\$1.216

It will be noted that I deduce from Mr. Gary's evidence that the actual cost of coke in Connellsville to the steel company in 1906 was \$1.21.

REYNOLDSVILLE PLANT OF 500 OVENS.

Coal, 1.7 tons, at 70c.	\$1.19
Charging, leveling, drawing and labor.	0.40
Salaries, supplies and depreciation	0.05
	\$1.64

In neither of these cases have I used any table exactly as given by Mr. d'Invilliers. He does not give the details of his estimates for a five-year average, and I have endeavored to supply them. There seems to be some mistake in his average of Reynoldsville costs, for they do not work out in proportion as he gives them.

Another example of coke costs more in detail is from a 200-oven hand-operated plant in Virginia—in 1900:

Cost of coal, 70.2c. per ton.	1.027
Coal used in making coke	0.023
Crushing	0.033
Charging	0.028
Leveling and sealing	0.210
Drawing	0.134
Loading	0.023
Switching	0.033
Salaries at plant	0.008
Tracks	0.021
Repairs	0.012
Supplies	0.006
Extraordinary expense	0.001
Insurance	1.561
Total	

In summary:

Raw material.....	1.027
Labor.....	0.459
Supplies.....	0.075
	1.561

The following year, 1907, the costs at the same plant were as follows:

Raw material.....	\$1 227
Labor.....	0.324
Supplies.....	0.114
Total.....	\$1 865

ANTHRACITE MINING

The extraction of run-of-mine anthracite is rather more expensive than that of bituminous coal chiefly because the anthracite seams are very much more folded. It is necessary to do vastly more development work in rock, and necessary also to use more timber in supporting gangways than is the case in flat seams. However, the constantly changing dip prevents the use of uniform methods throughout the mines. On the other hand, the coal often occurs in magnificent thick seams. The actual difference in cost for run-of-mine I do not estimate at more than 10c. per ton, 92c. for bituminous and \$1.02 for anthracite (per short ton, the long ton is used at the mines).

Below will be found consecutive statements of the costs of the Philadelphia & Reading Coal and Iron Company for a

improvements, which is regularly charged in as an operating cost. This is entirely as it should be, and the charge is doubtless based on the theory that the annual improvements to plant are simply sufficient to cover the renewal of equipment. The company has charged to improvements and equipments at collieries \$13,092,635. This is equivalent to about \$1.30 per ton on its annual output. Some companies would have charged a much larger amount to this item. The amount has not been increased in recent years in spite of the fact that since 1902 the output has increased 50 per cent. It is usual to charge off for depreciation at coal mines 6 per cent. of the capital employed in the plant and equipment. In the case of the Reading company, such a sum would have been sufficient in 1902, but would fall far short of the charges made in 1908. As costs are usually calculated, therefore, it would seem that this company is writing off somewhat more for depreciation than is strictly necessary. It would be obviously logical for the company to hold on its balance sheet a greater capital for an output of 10,000,000 tons per year than for an output of only 7,000,000 tons.

In other words, I wish to express my conviction that the costs given by the Philadelphia & Reading company for an-

and mine owners are taking in this humane movement, and it is bound to result in a decrease in the number of deaths in the mines. The sole purpose of the Government in taking up this work was to demonstrate its usefulness. It is not the intention to make the rescue-station work permanent."

"Perhaps the most complete of these private stations is that of the Frick Coke Company, which employs 30,000 men. The station has been erected at the Leising-ring mine, near Connellsville, Penn., in easy reach of all the Frick company's mines. There is a corps of six men being trained in the use of the oxygen helmet, a device that admits artificial breathing for two hours in the most deadly gases known. In order that the men be given practical experience in the use of these helmets, a part of the station has been devoted to an air-tight room which is filled with gases that will not support life. The men are being given a daily drill in this gas-filled room and are gaining confidence in the use of the helmets. Within a short time, the corps will visit the Government experiment station at Pittsburg, where the members will be given further instructions by the Federal experts.

Whenever a disaster occurs in any of the Frick company's mines, the rescue

Cost per short ton.....	1.85	1.96	2.00	1.95	2.10	1.93		1.93	

period of years. These tables in the main explain themselves, but it is worth while to make the following comments: The actual cost of mining and repairs will be seen to average about \$1.80 per long ton, equivalent to about \$1.60 per short ton. This is for current operating only, but it includes the cost of putting the coal through the breakers, and it is a cost based on the finished product which may be calculated to be only two-thirds the run-of-mine product. Details for the cost of breaking are not given, but from inquiries made in the region, it seems that 40c. per ton is an average. Deducting this sum we get \$1.20 for mining alone, and this is for mining 1½ tons of run-of-mine coal. The actual cost, then, per ton of run-of-mine to this company seems to be some 80c. per short ton.

The capital and general charges that follow in the statements largely explain themselves. The only item to which I wish to draw special attention is that of

thracite mining are adequate in all respects, and that, therefore, the accompanying statement gives an excellent idea of the real cost of anthracite mining.

Coal Companies Establish Rescue Stations

Four stations for the training of miners in rescue work have been established recently by the big coal companies of the country and several more are in contemplation. This is a direct outcome of the demonstrations in rescue work being made by the United States Geological Survey, Technologic Branch, at its experiment station in Pittsburg, Penn., and at the sub-rescue station in Urbana, Ill.

"The fact that these stations have been established is gratifying to the Geological Survey," said Director George Otis Smith today. "It shows the interest operators

corps will respond at once and will immediately enter the mine for the purpose of bringing to the surface miners who have been injured or are unconscious from the effects of gases. With these helmets, the rescuers can enter any gas-filled mine where it would be sure death for the miner to go. In many disasters, the men fortunate enough to be outside of the mine when the explosion occurred, have had to remain at the surface for hours, waiting for the ventilation to drive the gases out, knowing all the time that their comrades were dying.

A second rescue station has been established by the Fairmont Coal Company, Fairmont, West Va. A trained corps of helmeted men is ready for any emergency in this field.

A third station has been erected by the Pittsburg-Buffalo Coal company at the ill-fated Marianna mine, in Pennsylvania, which last November suffered an explosion with a loss of 140 lives. Already this

station has a complete corps of six highly trained men who know how to use the oxygen helmets.

A fourth station is at the Zeigler mines in Zeigler, Ill. This company also has a trained corps of six men, all picked for their coolness, courage and daring, for these elements are necessary in rescue work.

Mr. Paul, who has charge of the rescue work for the Government, recently left Washington for Europe where he will study rescue work at the European stations. "In the short time we have been operating, we have saved the lives of six men," said Mr. Paul "and if we did nothing more, the results would warrant everything that has been done so far by the United States in trying to reduce the accident death rate in the mines." However, I am satisfied more good will come from our efforts. The four stations just established will be the means of saving the lives of many miners, for we all know, many a poor fellow, imprisoned in a mine filled with the dread firedamp has lived in agony for hours before he died. I understand that the operators are to establish many more stations.

Automatic Switch Arrangement on Mine Inclines

By ROBERT GRIMSHAW*

As a rule, in the German mines, and as far as I know, up to the present time in America, the inclines have at the head and foot, turn-tables on which the "empties" are directed to the various headings. These turn-tables cost money for installation and repair, and this repair item upsets the traffic; furthermore, special employees are usually necessary to turn them.

The simple and practical arrangement shown in the accompanying cut, and which I understand is being introduced into some German mines, is intended to do away with the turn-tables, and what is more important, with the men necessary to work them.

Referring to the sketch: *A* is the track for the empties, *B* that for the loaded cars on the wire-rope incline. The empties are run as far as the point *C*, and there hitched to the cables. Passing the throw switch *D* they run in the direction of the arrow past the tongue switch *E*. The full cars run in the direction of the arrow *F*, open the tongue switch *E* and pass the throw switch *D*, going as far as *G*, where they are attached to the rope, which runs them along the track *B*, in the direction of the arrow. The switch *D* is so arranged that after the empties have run over it, the loaded cars, whether they come from *F* or from *H*, are always run onto the track *B*; while the tongue switch is so arranged that it shunts the empties automatically and alternately to *F* and to *H*.

The hand switching arrangement at *E*

is mechanically unnecessary under normal conditions, but it is there so as to provide for the chance that the switch might not work automatically. The German mining regulations call for certain arrangements of switches and barriers which must be there, whether or not any other contrivances are put in that might replace them.

GENERAL PLAN SHOWING ARRANGEMENT OF AUTOMATIC SWITCH

In order to facilitate pushing the empties, the tracks *A* and *B* are given about a 1-deg. fall in the direction of the arrow.

This arrangement renders unnecessary any coupling of the cars and turning of either empties or loaded ones. Of course, an increased output is possible; the men need not go on the incline at all, and the danger of accident is reduced.

Colliery Notes

Recent experiments where gunpowder of given composition was exploded in the presence of one volume of firedamp to 14 of air, $5\frac{1}{2}$ grains of water vapor, and 7.3 per cent by weight of coal dust, showed: (1) That the explosion of such blasting powder left behind it gases which would burn; (2) that these gases did sometimes burn and cause a secondary flame; (3) that after these gases had burned, there was a vacuum caused as soon as they were cooled down to the natural heat of the mine strata.

In the Saar collieries, in Germany, the evolution of firedamp appears to follow a regular course and is more marked in the bituminous-coal groups than in the longflame; it also increases with the depth from the surface. The mines in this district now follow their development work by using extensive packing, which practice has greatly aided in the diminution of accidents by falls of stone or coal. Engineers at the Saar collieries claim that

the use of water in settling dust is not effective, because it induces danger through causing rock to crumble. As a substitute for water, a solution of chloride of calcium is used, or, better still, its dry powder, which, in consequence of its great hygroscopic properties, is soon converted into a concentrated solution, and is capable of preventing the formation of dust for three months. The only objection advanced against the use of this salt is the expense, so that recourse is often had to a cheaper substitute, in the form of rock salt. The results obtained from the use of chloride of calcium in various German mines have been excellent.

Notwithstanding the increasing popularity of electric haulage, the endless-rope system remains in favor at many collieries where special conditions exist. The best features of this latter system of haulage are: (1) It is capable of dealing with large outputs in an easy form; (2) there is less wear and tear of rolling stock than with other systems; (3) it travels at a much lower speed than other system for a given output; and (4) it is, as a result of the foregoing advantages, less liable to breakage and accidents to persons and animals. In determining the size and weight of the rope in an endless-rope system of haulage, an ample margin should be allowed for safety, considering at the same time unusual strains which may come upon the rope by overloading. The net strain on the rope at the driving-pulley rim may be taken as the net load or resistance to be overcome by the engine. In practice, it is usual to allow from 25 to 50 per cent. for friction in engine gear and margin for undue requirements.

Some engineers believe that dust containing the highest percentage of volatile matter is the most dangerous; others assert that steam-coal dust with a high percentage of carbon is the most dangerous. Mr. Ashworth, the well known English authority states that it does not matter which kind of dust occurs providing it is equally fine and from a gaseous mine. He also says that no dust is really dangerous unless it is exposed to a certain degree of heat and for a certain length of time. In this connection, a German professor, named Bichel, has shown that 1.6 oz. of black powder would ignite, while 2 lb. of carbonite (a variety of permitted explosive used in Europe) would not do so, because the duration of the powder flame was 500 times as long as that of carbonite. This same authority states that with a temperature of 1200 deg. F., a flame must last for 10 sec to ignite firedamp, but if the heat was 1800 deg., only 1 sec. was required. Continuing the discussion, Professor Bichel says that the speed of detonation varies greatly; thus, the speed of dynamite is five miles per second, while that of carbonite is only 11.5 miles per second.

*Engineer, Dresden A. Germany.

Precipitation of Copper from Butte Mine Water

Waters Carry from 0.01 Per Cent. Copper to 0.03 Per Cent. and Higher;
Weakly Acid Waters Require Slower Flow. Leaching Old Tailings

BY CHARLES J. STONE*

The industry of precipitating copper from the mine waters of the Butte district within the past 10 years has grown to such an extent that it is at present of material and increasing commercial importance. No less than 30 precipitating and leaching plants are in operation along the Silver Bow creek in east Butte, and the total output of precipitate, or cement copper is about 750 tons per month. The product will average 60 per cent. pure copper and approximately 900,000 lb. of copper per month are recovered.

The operators of these plants are the large mining companies themselves, down to the leasers and to the individual who takes the tail waters from the large operators and wins from it a little of the remaining copper that will precipitate. The Boston & Montana, an Amalgamated com-

WATER PUMPED IN WOOD-LINED PIPES

Flanged-steel pipes with lead gaskets and lead lining were found to withstand the action of the water with a degree of satisfaction, but wood-lined pipe, which is less expensive, is now in practically universal use throughout the Butte district. For high-pressure water columns in shafts and other lower pressure pipes, a flanged-steel pipe is used and the wooden lining forms a male and female connection at the joints.

The lining is composed of pine slats put in place with hot asphaltum and the key piece is fitted and driven in firmly, so that the lining is held tightly in place. The whole pipe lining is then carefully painted with asphaltum, and when the pipe is put in place, great caution is taken in packing the joint to prevent seepage. In shafts

been exposed to the oxidizing influence of air and where waters leach through them, are productive of the highest grade of cupriferous water. When a deep level is opened, the flow is found to contain free acid, but only a small amount of copper sulphate is present. As the levels become opened and decomposition of the sulphides takes place, the water is enriched.

A flow coming from a section where the sulphide ore is burning or from a level where the fire has been extinguished, is enriched remarkably. The mine water of the Boston & Montana has been built up within a short period of time from this source alone from 0.02 per cent. copper content to above 0.2 per cent., and at this strength it threatened to destroy the phosphor-bronze castings of the pumps. For this reason an effort is made, where pos-

LEACHING TAILINGS WITH BUTTE MINE WATER

BOSTON & MONTANA SETTLING TANK AND CLEAN-UP HOUSE

pany, alone recovers 100,000 lb. of copper per month, and its operation shows a profit over and above its entire pumping expense.

While there is nothing new to engineers or metallurgists in the precipitation of copper in an acid solution by passing it over scrap iron and tin cans, yet some of the Butte operations present features of interest. Great difficulty was at first experienced by the mining companies to find something that would withstand the action of the mine waters on pumps and pipes and that would be within a reasonable cost. Phosphor-bronze castings were found to be necessary for the entire water end of all pumps where the water was found to be even slightly acid. The phosphor bronze is composed of 93 per cent. copper, 0.5 per cent. phosphorus, 4.5 per cent. tin and 2 per cent. lead. This metal, however, was too expensive for pipes.

where water from the upper levels drips on the pipes, it has been found necessary to thoroughly paint and cover the pipes with canvas, and the canvas then receives a thick coat of asphaltum. Wooden, wire-bound pipes are also used underground for light service, and on the surface wooden launders or flumes are used.

The copper content as well as all other mineral salts and the amount of free acid tained in the mine waters, varies widely in different mines and different sections in the district. Cupriferous waters were not encountered to any great extent in the upper levels, nor at shallow depths, but when the shafts penetrated the great copper horizon at from 500 to 2200 ft. in depth, the waters were found to be highly charged with mineral salts and free acid.

ENRICHED WATER FROM FIRE LEVELS

Old workings, abandoned upper levels and gob or stope fillings that have long

sible, to regulate the grade of water to a strength that will not attack the bronze pump parts.

The cupriferous water from the various mines carries from 0.01 per cent. to 0.031 per cent. copper as copper sulphate. The process to recover this as native copper by passing the solution over scrap iron is simple. The iron supplants the copper in its union with the sulphate radical, the copper being precipitated as a crystalline powder, while the sulphate of iron is carried off in solution. It would appear that the mine waters are extremely poor in copper as compared with the solutions in a leaching operation, but when a mining company is pumping 500 gal. per min., the precipitation amounts to approximately 1600 lb. of copper per day and the saving is effected with but little expense.

PRECIPITATION EQUIPMENT

The copper precipitation is effected in

*Consulting mining engineer, Butte, Mont.

open launders and in towers. The launders are set at sufficient grade so that the water flows rapidly, and scrap iron of all classes is thrown into it, but care is taken to allow the water to flow freely. The launders are from 3 to 4 ft. wide and from 1 to 2 ft. in depth, and are built single or double. The water is kept at from 6 to 12 in. in depth in the launders. If the water as it comes from the mine is strong in acid, better results are obtained where the water flows at a greater velocity, but if weak in acid, a slower flow is desirable. It is well at all times to keep the iron and launders free from accumulations of iron oxide.

The towers are built from 8 to 12 ft. wide, 10 to 14 ft. high, and from 50 to 150 ft. long, the size depending entirely upon the flow to be handled. They are built open on sides and ends and large scrap sheets of iron are placed to hold the dripping water within the water-tight bottom; or they are inclosed entirely on all sides by baffle boards to keep all water within the tower sump. The water comes into the top of the tower in an open laun-

der and the flow is regulated by means of gates and side distributing troughs so that the shower is uniform throughout the tower. The tower is filled with scrap iron for perhaps one-quarter to one-half its height.

shipped to Great Falls where it is smelted in reverberatory furnaces. The average quality of the precipitate is between 60 and 70 per cent. copper.

A well-arranged plant is so located that the solutions can flow by gravity from the mine through the launders and down through towers, with the clean-up vats below. It is well to place the clean-up vats and dryer under the same roof. The extent or magnitude of the plant depends upon the limit of extraction it is found profitable to make from the solution. All launders and towers should be built in parallel duplicates so as to facilitate rapid and thorough cleaning. Wrought and steel scrap are better than cast iron and thin sheets are more satisfactory than heavy pieces. About 75 lb. of cement copper are recovered in practice from 100 lb. of scrap material.

LEACHING OLD TAILINGS DUMPS

A number of the large tailings dumps from the early concentrating mills, which were neglected for years, are being worked successfully in connection with the

were driven through the dump on the slime-covered soil of the valley and a cribbed trench surrounds the dump, all of which lead to a common sump to be elevated into the precipitating towers or flows by gravity into precipitating boxes.

The water which is fed to the ponds contains but a trace of copper and is very weak in free acid. After leaching, its copper content has been built up to 0.02 per cent. and precipitation is satisfactory. The product from this particular plant averages 80 per cent. copper. They are pumping 750 gal. of mine water per minute upon the sands and, approximately, 80 per cent. of this is recovered and fed to the precipitating plant. A daily analysis of the leached solution will give a close estimate of the daily recovery of copper.

This method of leaching, while attended with serious losses in solutions, is possibly the only method by which the sands can be treated commercially. However, it does not prove that it would not be advisable to convey the sands to leaching tanks and add a small amount of sulphuric acid to assist extraction. A 20 per

BOSTON & MONTANA PRECIPITATING TOWERS AND LAUNDERS AT BUTTE, MONT.

der and the flow is regulated by means of gates and side distributing troughs so that the shower is uniform throughout the tower. The tower is filled with scrap iron for perhaps one-quarter to one-half its height.

BETTER EXTRACTION IN TOWERS

Experience has shown that a better extraction is effected in the towers than in the launders. This is especially noticeable where the solution is both weak in acid and copper. Doubtless exposure to air has a beneficial effect, but the arrangement is more efficient in that the falling water keeps the scrap clean and bright, and prevents an accumulation of iron-oxide slimes.

A clean-up is effected by turning the flow into other launders of the plant, scrubbing and washing the scrap free from copper scale and sluicing the launders and tower sump into settling vats, where the clear solution is decanted off. The cement copper is then dried, barreled and

precipitation of copper from mine waters. The dumps carry approximately 1 per cent. of copper. Years of weathering have made possible the leaching of these tailings on a profitable basis.

The dumps are from 20 to 50 ft. in depth and cover many acres of ground. The James Gillie lease, operating on the old sands of the Montana Ore Purchasing Company, is worth studying from an engineering and economic standpoint. The dump, which is located in the bed of Silver Bow creek, contains upward of 200,000 tons of sands. They average from 20 to 30 ft. in depth.

The supposedly barren tail water from the precipitating towers of the Boston & Montana Company is elevated to the highest point on the dump. Ponds of from 5000 to 15,000 sq. ft. are arranged so that the overflow from the higher will run to the next lower pond until the entire flow is absorbed. To reclaim the water after it has leached through the sands and taken up the soluble copper, two level tunnels

cent. loss in solutions on the method that now obtains at this plant amounts to a loss of 324 lb. of copper per day. This, doubtless, sinks into the soil of the valley and is beyond recovery. As far as known to the writer, no regrinding and leaching test has ever been made on Butte tailings to determine if they can be worked commercially.

The Broken Hill Block 10 Company, New South Wales, has practically completed a contract (*New Zealand Mines Record*, Feb. 16, 1909) to sell to the De Bavay Company 300,000 tons of zinc bearing tailings. The price to be paid per ton will depend upon the average value of spelter over a term of three years.

In the February issue of the *New Zealand Mines Record* it is stated that the North London Railway Company carries 1,000,000 tons of coal and coke, and 2,000,000 tons of merchandise over its lines in the course of a year.

Manganese Deposits in Southern India

In India the production of manganese increased from 3130 tons in 1893 to 581,036 tons in 1907. The extensive prospecting in India has opened up a new manganeseiferous region in the southwest embracing the native state of Mysore, the northwestern part of the Bombay Presidency, and the Portuguese territory of Goa. In Mysore alone by 1907 more than 1000 square miles of land had been taken up for manganese mining, notwithstanding the fact that this region only came into prominence in 1906. In this same year the export from Mormugao harbor increased ten-fold.

These south Indian manganese occurrences are classed by F. O. Ahlers, in a paper presented before the Institution of Mining and Metallurgy at London, November, 1908, as either being in conjunction with the South Indian laterites or, as in the hematite-quartzite bands of the Dhawar beds. The Goa deposits and others toward the western Ghats are cited as examples of the first class. Examples of the second type are found throughout the huge hematite-quartzite beds which characterize the Dhawars. Here exploitation has advanced where the manganese bodies open out into large blows of almost solid ore.

In general, although the quartzite bands carry some manganese the ore deposits worthy of note are considered to be due to secondary enrichment from meteoric waters. The replacement is easily observed on the outcrops, where the iron oxides were attacked first. Angular fragments of the original iron ore are frequently observed coated with manganese.

Disintegrated quartzite fragments in the form of quartz sand are also found in much of the ore, giving to it a spotted appearance. Where the replacement has been complete the ore usually runs more than 50 per cent. metallic manganese.

The manganese deposits, information of which we gain from the work of Mr. Ahlers, are those of the native state of Sandur. Bellary district, in the north of the Madras Presidency. The Sandur state occupies an elliptical basin about 24 miles long with a width of about 13 miles. The Narihalla river cuts transversely through the two ranges of hills which form the rim of the basin.

GEOLOGY

The Sandur hills are a portion of one of the beds of the Dhawar series of rocks. These are of Archaean age and of a schistose nature. The characteristics of this locality are those of other Dhawar areas. The predominant rocks are argillites, hard crystalline schists in the lower beds, but weathered to soft shales toward the tops of the ridges. Hematite quartz-

ite bands occur frequently running conformably with the country and massive intrusive dikes, usually of a basic nature, traverse the series. Surrounding the hills is gneiss, which is the most common rock in this part of India.

In the north end of the valley there is a true syncline, but the southern part is more complex and is connected to the east with the Copper Mountain range. Upheaval is marked as indicated by the upturned strata in the middle of the basin. The dip flattens out toward the rim, and flat hill tops forming a high plateau are characteristic. Another noticeable feature is the ferruginous deposits chiefly of laterite and lateritic conglomerates covering the plateau. Hematite is bedded with the country rocks while the laterites form a capping sometimes 25 ft. deep.

THE OREBODIES

The manganese deposits are situated in the softer rocks of the series usually at or near the forests of the hills. These deposits may be divided, for consideration, according to location into four divisions, namely: Those occurring at the top of the outside slope of the western range; those in a similar position in the northern part of the eastern range; those at the top of the inside slope of the eastern range, and those occurring as plateau deposits.

Deposits of the first nature are of the greatest importance, and for 24 miles along the range nearly every spur on this outside western slope shows an outcrop of ore. In places there are sheer cliffs showing 70 ft. of ore, and many are to be seen from 20 to 40 ft. high, and of lengths ranging up to 400 ft. These deposits present a remarkable view, and by their appearance of continuity and from the fact that they always conform with the country in dip and strike suggest an imbedded bed of ore. Drifts and prospecting pits have, however, proved the maximum depth attained by these orebodies to be about 80 ft. The lateral extent is so great, however, that there is an immense amount of ore.

The other three occurrences of ore are of minor importance. On the inside slope of the western hills few large deposits are seen; on the eastern hills the deposits are of no great extent, and those on the plateau have a depth of only about 10 ft. The manganese ore ends abruptly in contact with a conformable layer of hematite which changes in a couple of feet to ferruginous shale and then to lithomarge. The lithomarge is relatively thick and underlain by the country rock.

THE ORE

The manganese ore of the Sandur deposits is remarkably pure, although always associated with iron. Psilomelane is the chief ore. It is hard and of a bright, steely luster where exposed to the air,

but friable and schistose in the interior of the deposits. Braunite and some wad is also found in the plateau orebodies. This is more closely associated with the iron capping than with the massive deposits. Remarkable, too, for Indian manganese occurrences, nests of fine manganite crystals are found all through the ore. Crystals of pyrolusite and probably of hollandite as pseudomorphs after manganite have also been identified by A. Chose in his study of the ore of Sandur. Harmful impurities all run low, silica usually below 2 per cent., and phosphorus fairly constant at 0.01 per cent. The ore always carries some iron, seldom less than 5 per cent., and ranges through all stages from ferruginous manganese to pure hematite.

By students of these orebodies the original rock is considered to have been metasomatically replaced by the oxides of manganese and iron through the agency of meteoric waters. Mr. Ahlers found that the country rock 10 ft. below the lithomarge contained 3.75 per cent. metallic manganese. He considers that as erosion advanced the manganese was concentrated, then acted upon by solutions, charged with carbon dioxide derived from decaying vegetable matter, acting as solvents. These solutions rising as the surface rocks became heated in summer, deposited their metallic burden at the surface. This is corroborated by the fact that the greatest wealth of ore is found on the hillsides most exposed to the sun. The association of ore with lithomarge is characteristic of the region. Everything indicates that the site of these interesting orebodies was formerly occupied by a soft shale, while this same evidence all tends to disprove any such theory as that of original deposition which might be offered to explain these occurrences.

Zinc Mining in Algeria

It appears from particulars given at the general meeting of the Mines d'Ouasta et de Mesloula, Algeria, that the working of both mines was successful in 1908. The Ouasta calamine is forwarded to Antwerp and the zinc contents of the shipments have been improved by the newly installed concentrating mill. The Mesloula lead ore, sold to the Compagnie de Pontgibault, was forwarded to the works at Couéron in Loire-Inférieure. The board of directors has informed the shareholders that concentrating mill No. 2, begun in 1908, is now completed and started. Thus equipped, the Mesloula mine can yield a yearly production of 10,000 tons of marketable ore and will rank as the first lead mine in Algeria. The company is interested with Mokta-el-Hadid in the Ain Al-léga concession of lead, zinc and silver ores, and is carrying out an interesting program of investigations both in Algeria and Tunisia.

Milling in the Cripple Creek District, Colorado

By S. A. WORCESTER*

It is my purpose in this article to afford some useful suggestions to operators interested in the Cripple Creek district, by mentioning some of the causes which have contributed to failure in its past milling operations; also by directing attention to results thus far obtained by mills in operation, to encourage conservative investment in local treatment plants of moderate size, well designed for economy in construction, operation and maintenance.

I have now in mind 24 mills, ranging from 10 to 1000 tons estimated daily capacity, which have been erected in this district and operated with varying degrees of success and failure.

MILLS THAT WERE FAILURES

One or more of the largest of these plants have been grafting operations and have not run for more than a few days or perhaps a few weeks at any time. Two custom stamp mills, built at large expense early in the history of the district, with the aid of little or no knowledge of a practical process for these ores, had short lives, and, after periods of idleness, burned to the ground.

Two later custom mills, one a roasting and cyanide plant, the other a large chlorination plant, were operated with fair success as long as the general grade of ore was sufficiently high to justify their minimum treatment charge of \$6 or more per ton. When the grade of ore lowered, they ran intermittently for a while, then were destroyed by fire. At least eight of the mills now standing were built with capacities far too large for the available ore supply. Several of the present mills were erected by managers having no practical knowledge of milling operations, yet perfectly willing to try their own valueless ideas *ad infinitum*, at the expense of the shareholders. These mills either have been, or will have to be, remodeled completely before satisfactory results can be obtained.

Aside from flagrant financial irregularities, the principal cause of failure is probably the fact that managers did not ascertain with sufficient thoroughness the quantity, character and value of ore available for treatment, before erecting plants. It is difficult for some men to believe that mill returns from their own plants will sometimes run far below their mine samples. They are also unable to resist the temptation to overestimate the continuity of an orebody and to build accordingly.

FAULTS OF LOCATION AND DESIGN

A number of mills by being located at a distance from railroads, have incurred a minimum haulage of 65c. per ton, which is quite a serious item. Nearly all of the mills are so located as to require either haulage or tramping from mine to mill. There is at present but one mill in this district at which the mine skip dumps directly into the mill bin, and this skip dumps at a point so low that the ore interferes with further dumping as soon as the bin is about one-fourth full. The items of labor and power cost and maintenance are dependent primarily on the design of the plant. In many cases plants which were intended by their designers to be completely automatic have had their mechanical details so incomplete and so poorly designed and arranged as to render continuous operation impossible.

In local cyanide plants it is no uncommon practice to shovel or scrape ore into a crusher instead of using an automatic feeder, to load tanks with a hand-operated car instead of an automatic conveyor, to level the charge with the shovel instead of the automatic excavator, to discharge the tanks with the shovel and perhaps tram the tailings to the dump with a car. Automatic machinery for these operations, now thoroughly practical, is at the command of every well-informed designer and repays its cost in a few months, sometimes a few weeks, of continuous operation.

ITEMS OF EXPENSE AND LOSS

One important item of expense in this district is the cost of water. Those plants that sluice out their tailings pay large monthly bills for this item alone. Several objections to this method may be cited, including the labor cost of sluicing tanks, the expense of maintaining dams if the tailings are to be retained on the millsite, the maintenance of metal-lined sluices if the tailings are carried any considerable distance, the frequent damage to filter canvas by the sluicing stream, the liability to damage suits when tailings are allowed to run down the gulch, and the loss of possible values in the tailings, which, although at present are negligible, may at a future time be made valuable by improved processes if the tailings are retained. These objections may be removed by use of the excavator and conveyor system, which deposits the tailings automatically near the mill, at very small cost.

Among fruitful sources of loss in past milling practice has been the revolving roasting furnace in its various forms, losing much in dust and wasting heat by its short and direct passage from the grates to the stack. The revolving furnace is now out of use in this district. The chlorination process, always expensive, has now been superseded gener-

ally by the cheap and simple cyanide process. Oxidized ores are crushed to the required fineness and treated by simple leaching or by agitation in cyanide solution. Briefly summarized, the principal causes deterrent to past and present milling in this district seem to be: (1) Graft, or large financial irregularities; (2) entire ignorance or inexperience; (3) lack of knowledge of the most economical process (4) overestimated ore supplies and excessive plant investment; (5) ill-advised location of plants; (6) poor mechanical design and construction.

Passing the first and considering the second cause named, it is highly important that the manager, if not experienced in mill work, should have sufficient business sagacity to select and employ experienced and educated men for his expert work, so as to accomplish results. The third cause reminds us that laboratory tests are seldom sufficiently comprehensive to furnish full data as a safe basis for designing a milling plant. I consider it advisable to erect and operate an experimental plant, in some cases one-tenth of the probable size of the complete installation, and to operate it until all parts of the orebody have been thoroughly tested. In some cases this experimental plant may later become a unit or part of the completed mill.

The fourth cause overestimated output, reminds us that the value of thorough preliminary sampling and testing is seldom fully recognized. It is far better to expend several hundred or even several thousand dollars, if necessary, in repeated sampling and adequate testing, in order to learn positively that a plant will not be justified, than to invest ten times as much time and money in a plant, only to learn that success is unattainable. The fifth cause suggests that where conditions are favorable the mill should be so located that the mine skip may dump directly into the mill bin, thus eliminating all transportation.

DESIGNING THE PLANT

The sixth cause mentioned brings to mind the propriety of employing the best obtainable talent, even at considerable expense, for the design and construction of the mechanical features of the plant. The engineer employed for this work should combine thorough technical training with considerable practical experience, and should be given time sufficient to complete designs and specifications in a thorough manner, before commencing construction. Very few mining operators appreciate fully the very great economies, both in construction and operation, which are made possible by carefully considering and comparing a number of different preliminary pencil layouts of a projected plant, the engineer being in collaboration with the manager and perhaps one or

*Mechanical engineer, Victor, Colorado.

more of his assistants, and due weight being given to any suggestion offered, in order that no point of importance may be overlooked. When the drawings and tracings are completed, and specifications and bills of material written, they should be carefully checked by some other person than the designer, in order that no mistakes in figures, calculations or dimensions may pass out, to cause misfits, delays, expense and possibly litigation. This thorough and painstaking course of procedure is, in itself, more expensive than merely making one or two hasty pencil drawings and beginning work on the plant at once, but the more conservative start will inevitably result in earlier completion, at less cost, better construction and far more satisfactory operation. By submitting complete blueprints and specifications to competitive bidders, using the engineer's estimates, a low tender can nearly always be secured.

SUCCESSFUL PLANTS

Although many past records are discouraging, there are at present in more or less regular operation in this district, five cyanide plants, three of which use comparatively coarse crushing and the simple leaching process, while a fourth separates the pulp into slimes and sands, leaching the sands and agitating the slimes. The fifth plant reduces the entire pulp to slime and treats by agitation with cyanide solution, finally washing the rejected slime with the Butters vacuum filter. The average gold content of the ores treated by these five plants, with an approximate daily capacity of 250 tons, is hardly greater than \$4 per ton, or 50c. less than the lowest rate offered by the outside custom mill for freight and treatment, yet these local mills are clearing a fair profit. One local plant has been treating for some time about 100 tons per day, of ore averaging less than \$2 per ton, yet it is paying regular dividends. The comparative success of these plants is a standing invitation to mining operators to enter the milling field, with its probable larger net results.

MINING AND MILLING COSTS

A few figures will suggest how small a portion of the mineral value of the ores of this district become net returns to the small shipper. Mining is seldom less than \$2 per ton. Hauling is 65c. minimum; sampling \$1; freight and treatment \$4.50 minimum; moisture and other penalties, resampling and incidentals will raise the minimum cost to more than \$8. In mining operations of moderate size, it is seldom that any net profit can be realized from ore not exceeding \$8 in gold content. An operator having 8000 tons of \$8 ore might possibly net 50c. per ton, or \$4000, by the time the ore is exhausted, under favorable circumstances.

The following figures, based on practice, indicate good results from a very small plant, located so that the mine skip dumps into the storage bin of the mill, from which the crusher is fed. This roasting and cyanide plant of 20 tons daily capacity will cost about \$12,000, ready to run. It is so designed as to be operated by one man, on each of three eight-hour shifts. Supposing this mill to operate continuously for 400 days, treating 8000 tons of \$8 ore, daily operating costs per day will be about as follows: Mining cost, \$40; interest, repairs and amortization, \$30; labor and superintendence, \$15; cyanide, \$2; power, \$2; roasting, \$6; water, \$1.80; laboratory, incidentals, etc., \$1.20; total daily cost of mining and treating 20 tons, \$98. The gross daily result of 85 per cent. extraction will be \$136 and the net daily result \$38. The total net profit from 400 days' operation will be \$15,200. The plant should, after 400 days, be worth \$6000. While the initial expense of a roasting furnace is an item of considerable importance in plants for treating the unoxidized ores of this district, it is a fact not generally known that a furnace of the McDougall multiple-hearth type, with which I have had considerable experience, can be built and operated successfully on these ores in much smaller and less expensive units than those now generally used. The principal objection to its adoption thus far raised, namely its tendency to produce dust, is easily overcome by a trifling modification in the method of transferring the ore from hearth to hearth. Its economy of fuel, space and power over all rectangular furnaces is quite obvious, and the low initial cost is also much in its favor. There are in this district a number of bodies of oxidized ore of low grade, entirely suitable for moderately coarse crushing and plain cyanide treatment by the leaching process. A 20-ton mill of this character can be erected in this district for about \$7000. Suppose the available ore to be 10,000 tons, of \$5 per ton, dumped by the mine skip directly into the mill bin. If properly designed, this mill can be operated by one man, working eight hours per day, the crushing being done in about four hours. The mining cost can be made about \$1.50 per ton under proper conditions, and treatment, including labor, power, water, cyanide, amortization, repairs and incidentals, will cost about \$1.20 per ton; with this automatic plant, giving a recovery of 80 per cent., or \$4 per ton, there should be obtained a net return of \$1.30 per ton, or \$13,000 from 10,000 tons. The plant should be worth at least \$3000 after 500 days.

If a plant is so located as to involve expensive transportation, and is built without a thoroughly considered design, so that the initial and operating costs are

excessive; if the extent, character and value of the ore supply are uncertain; then there is small probability of success. On the other hand, with a well determined ore supply, a treatment plant so located as to eliminate all transportation, and so carefully and thoroughly designed and constructed as to reduce initial cost as well as operating cost to a minimum, there is extreme probability of the small plant competing very successfully with the distant custom mill. The mills of the past have been largely wasters. Present mills, although not all automatic, are still a marked improvement on past practice, and I predict confidently that future mining operations will be largely augmented by the success of mills of moderate size, contiguous to the mines.

Mineral Possibilities of the New Hebrides Islands

By G. M. COLVOCORESSES*

Little has been written concerning the geology or mineral possibilities of the New Hebrides islands. There are two reasons for this: (1) The interior of all these islands is almost unexplored; (2) such exploration and prospecting as has been done has not yet resulted in finding any workable mineral deposits (with the exception of sulphur) in spite of the occasional wild stories of hidden wealth that filter out from various parts of the group. The New Hebrides islands are situated in latitude 12-20 deg. south and longitude 165-170 deg. east, or about 200 miles directly north of New Caledonia. The total area of the group is estimated at something over 6000 sq.m., and the population is composed of about 500 whites (French and British subjects) and an undetermined number of natives variously estimated at from 40,000 to 75,000. The climate of these islands is of the worst, being very hot and very moist, especially in the hurricane season (December to March).

During the years 1902, 1903 and 1904 the greater part of which I spent in New Caledonia, various tales of mineral finds in the New Hebrides kept coming to Noumea, and at the beginning of 1905 I determined to make a trip to the New Hebrides and ascertain, if possible, the truth of some of these stories. I had, moreover, two distinct objects in view: (1) to examine the volcanic deposits of sulphur which were known to exist on the islands of Vanua Lava and Tanna; (2) to determine whether or not the New Caledonian formation of peridotite and serpentine rocks with their attendant deposits of nickel, chrome and cobalt ores

*Mining engineer, 43 Exchange place, New York.

extended northward and cropped up again in the New Hebrides.

Accordingly I spent the greater part of January and February, 1905, in the New Hebrides, traveling about on a small copra-trading steamer, visiting eight of the principal islands, examining the beaches, river beds and rock formations and any accessible point of interest, and obtaining specimens and information from the missionaries, settlers and natives. The trip itself was an unusual and interesting one, but the results in the main were unsatisfactory.

GEOLOGY

It would be hard to imagine a region in which it is more difficult to do prospecting or geological work. Expeditions into the mountains and interior of the islands were only possible in a few cases and almost invariably the jungle vegetation was so thick and the outcrops of rock so rare and hard to trace, that any real study of the formations was impossible.

The formation of practically all the larger islands seems to be similar; there is a core or center of volcanic origin, the volcanoes themselves being generally extinct, but some are still active on the islands of Vanna Lava, Ambrym, Aoba, Lopevi and Tanna. In some cases as Lopevi, the island itself is really nothing but the volcano which rises in a perfect cone from the sea to a height of over 4000 ft., with deep water close to the shore and practically no lowlands surrounding the slopes of the mountain. On most of the islands, however, the volcanic core is surrounded by sedimentary and coral formations, and the land has been raised by successive upheavals so that the coralline limestones are often found at a height of several hundred feet. At various times lava flows have spread out over these benches of coral and in some cases completely covered them and run over into the sea.

The coral rocks and the lavas seem to form by far the greater part of the islands. The lavas are mostly acid in character, with feldspar predominating and generally perfectly crystallized. For the most part they appear to have cooled very quickly, being full of gas bubbles. In places tufas have formed together with pumice stone and great beds of volcanic sand. There are, however, some schist formations of sedimentary origin generally of limited extent, much thrown and tilted and metamorphosed in places. These are usually covered with heavy soil and vegetation and very little can be said concerning them. Chronologically, I believe that all of the New Hebrides islands are of comparatively recent origin and they are still very incomplete since land is continually being made by the volcanic outflows from above and also by the uplift of the coral reefs from beneath. In places subsidence may be going on, but for the most part the contrary is the case.

ROCKS AND ORE DEPOSITS

As stated, the rocks forming these islands are mostly coralline, volcanic lavas, tufas and schists. Nowhere was I able to find any evidence of peridotite or serpentine formations, nor of any outcrops of intruded plutonic rocks with which ore deposits might well be associated. It is, however, possible that such exist in the more inaccessible portions of the group and especially in the central mountains of Santo and Mallicolo.

Decomposition of the more basic portions of the lavas have formed small beds of ferruginous clay and ochre at several points and the latter is used by the natives as a paint with which to smear their bodies and decorate their totems. Magnetic-iron sands also are found in some quantities near the seats of volcanic action and especially along the sea beaches where the lavas have been broken and ground up by the waves.

On the island of Mallicolo there are some deposits of graphite. The mode of occurrence is not clear, but it seems probable that the deposits are of the bedded variety. They are found in schists formed largely from calcareous (coral) sediment and partially metamorphosed, due to some volcanic activity in their vicinity. The quality of the graphite is rather poor, and no deposit of commercial importance has yet been found.

On the island of Pentecost and elsewhere, I found considerable iron pyrite in the river beds, but none of the specimens examined contained gold in any appreciable quantity. Rumor of placer gold in some of the river sands and of gold-bearing quartz veins in the interior have been persistently circulated, but I was unable to find any evidence of their truth. The natives of these islands possessed no gold, the missionaries and settlers who have inhabited portions of these islands for over 50 years have never obtained any, and I am strongly of the opinion that no gold is to be found in this group in sufficient quantities to pay for its extraction.

SULPHUR

As to the sulphur, it is here, of course, purely a volcanic product, and deposits have been formed and are still forming at Vanna Lava, Tanna, and to a less extent on some of the other islands. The gases emanating from the craters and the fumaroles and crevices along their sides and the waters of the hot springs near by are highly sulphurous, and the sulphur is deposited as a sublimate in thin layers mixed with sand and silicious sinter. No deposits of cinnabar, stibnite, or other sulphides seem to be associated.

As stated in an article in the JOURNAL, Dec. 23, 1905, an attempt was made a few years ago to work the sulphur deposits on Vanna Lava, and considerable money was expended for equipment. But the fever and dysentery quickly bowled over the en-

gineers and white laborers who went there, proving fatal in many cases, and for this and other reasons the project was then abandoned. Recently there has been some dispute as to the ownership of this property, but this will probably be settled in the near future by the joint English and French commission which is for the first time issuing regular titles for all properties held or claimed in these islands.

At Tanna, considerable sulphur was mined about 20 years ago and shipped to Australia, but a later eruption of the volcano completely closed up the entrance to Port Resolution, the shipping port, and since that time no active work has been carried on here.

Possibly the sulphur deposits may be again worked in the future; also some mineral deposits of value may be discovered and worked after the natives have been brought under better control and systematic exploration is made possible. But in general, I have not a good opinion of the mineral possibilities of the New Hebrides. The difficulty of access, especially during the hurricane season, the long distance from the principal markets of the world, the high cost of all supplies, the unhealthy climate, the lack of skilled labor and the poor quality of the unskilled labor available are some of the things that would have to be seriously considered by any mining company wishing to operate in the New Hebrides.

Making an Electric Hot Plate

C. A. Rose (*West. Chem. and Met.*, IV, pp. 113-114) describes a home-made resistance-wire electric hot plate. A box of 1/16-in. sheet steel, 2 1/2 to 3 in. deep and the other sizes as desired, is lined throughout except the top with 0.25 in. asbestos, using several thicknesses on the bottom. The asbestos is fastened to the vertical sides by iron strips, 1/4 x 1/2 in., bolted to the box. The top of the box is a 3/16-in. plate fitted loosely and supported by the iron strips. Resistance-wire coils, 5/8 in. diameter are strung back and forth across the box, insulating each coil from the adjoining one with a 1-in. strip of heavy asbestos paper. Adjacent turns of a coil should not be in contact. The coils are held in place at their ends by wire fastenings attached to an extra strip of 1/4-in. asbestos at either end of the box.

An absorption of 1280 watts per sq. ft. of surface will maintain the hot plate at a temperature of 327 deg. C. The length and thickness of the wire can then be easily calculated, using as heavy wire as possible on account of its mechanical advantages. With a 230-volt circuit, Mr. Rose used 600 ft. of No. 18 wire (Brown & Sharpe gage) wound in two coils, connected in multiple, for a hot plate of about 2 1/2 sq. ft. area.

THE ENGINEERING AND MINING JOURNAL

Issued Weekly by the

Hill Publishing Company

JOHN A. HILL, Pres and Treas. ROBERT MCKEAN, Sec'y.
505 Pearl St., New York.
London Office: 6 Bonvicini Street, London, E. C., Eng.
CABLE ADDRESS: "ENGINEERING, N. Y."

Subscription, payable in advance, \$5.00 a year of 52 numbers, including postage in the United States, Mexico, Cuba, Porto Rico, Hawaii or the Philippines. \$6.50 in Canada.

To foreign Countries, including postage, \$8.00 or its equivalent, 33 shillings; 33 marks; or 40 francs. Notice to discontinue should be written to the New York office in every instance.

Advertising copy should reach New York office by Thursday, a week before date of issue.

For sale by all newsdealers generally.

Entered at New York Post Office as mail matter of the second class.

CIRCULATION STATEMENT

During 1908 we printed and circulated 507,500 copies of THE ENGINEERING AND MINING JOURNAL.

Our circulation for April, 1909, was 43,000 copies.

May 1.....12,000
May 8.....10,000
None sent free regularly, no back numbers.
Figures are live, net circulation.

The Decision on the Commodities Clause

The decision of the United States Supreme Court on the appeal taken by the Government from the Circuit Court in the suits brought to enforce the Hepburn law, while it is on the face of it a reversal of the lower tribunal, proves to be much less than that in practical effect. The Circuit Court held that the so-called commodities clause was unconstitutional in that it would deprive the companies directly concerned in the suit of their property without due compensation. The Supreme Court sets aside this part of the decision, holding that the law in itself is constitutional and that its passage was within the powers of Congress to regulate interstate traffic. On the other hand, it limits materially the contentions of the Government and brings down the provisions of the law in such a way as, to make it cover a very narrow limit.

The Hepburn act prohibited railroad companies from carrying commodities which they own, or in which they were interested, and was intended to compel railroad companies to divest themselves of all ownership in coal mines or other industrial enterprises. The suit to enforce the law was brought against a number of the anthracite coal companies of Pennsylvania as the most conspicuous offenders. It proves, however, under this decision, that it cannot be enforced even against these companies. The Court holds that the ownership of stock by a railroad company in a coal-mining company does not constitute such ownership of the coal carried as would debar the railroad from transporting it; and further that it is not forbidden to carry it, provided it is sold in good faith before the transportation is begun. Under this decision those anthracite carrying roads which mine their coal through the medium of a subsidiary corporation need not make any change in their present arrangements. In two cases—those of the Delaware & Hudson and the Delaware, Lackawanna & Western—where the companies own and operate their mines directly, it will be necessary for them either to transfer those mines to another corporation in which they may own all the stock; or to alter their methods of selling by disposing of the coal at the mines, instead of selling it at tidewater or other points. Such arrangements

can be made without much difficulty, although they may require a little time to effect.

In brief the Supreme Court decides that the act is constitutional, but with such limitations as will make it practically impossible to enforce it in the sense and intention with which it was originally passed.

The most important change effected by the law will be that the anthracite-coal roads will have to discontinue the practice, which has prevailed for a number of years, of buying the coal of the independent operators at an agreed percentage of the tidewater price. Such coal, it would seem, will have to be accepted at a freight rate to be established as other freight rates are. It is probable, however, that a subsidiary company could purchase such coal under any lawful agreement, as that would be quite apart from the transportation.

The Lake Coal Trade—A Study of Freight Rates

The coal operators of the Pittsburg district, through a representative committee, have recently made an application to the Interstate Commerce Commission, charging that the railroads discriminate unfairly in the rates charged on coal from that district and Ohio, as compared with West Virginia coal. This is especially the case with the rates on coal to Lake Erie ports for shipment by water to the Northwest; and it is these rates which have been selected as the point of attack before the Interstate Commission.

The case of the operators is fairly stated in a circular issued by H. P. Taylor & Co., of Pittsburg. A table has been compiled and is presented, showing the railroad rate on Lake coal from different districts, the average haul from each district, and the rate per ton-mile, based on those average distances. This table, in condensed form, is as follows:

	Present Rate.	Haul, Miles.	Rate per Ton-mile, c.
Pittsburg.....	\$0 88	160	0.550
Ohio No. 8.....	0 85	155	0.548
West Virginia:			
Fairmont.....	0 97	240	0.405
Kanawha.....	0 97	351	0.274
New River.....	1 12	490	0.228
Pocahontas.....	1 12	460	0.231
Cabin Creek.....	0 97	493	0.214
Thacker.....	0 97	380	0.255
Kentucky:			
Big Sandy.....	0 97	420	0.231
Marathon.....	0 97	490	0.198

The 180 mile rate is, therefore, more than twice as great on Pittsburg coal as on Kanawha, and nearly three times that on some Kentucky coals. It is claimed that if a uniform ton-mile rate—say 0.4c.—were imposed, the rate from the Pittsburg district to Lake ports would be 64c., while on West Virginia coals it would run from \$1.28 up to \$1.96 per ton. Such a difference would, of course, be of great importance. It is also urged that the cars from West Virginia mines go back empty, as a rule, while many of those from Pittsburg have a return load of iron ore.

So far this presents the Pittsburg operators' argument. The case as to rates is not presented with entire fairness, however. The terminal expenses are nearly uniform on all coal, whatever the haul, and this reduces considerably the apparent discrimination. Deducting these on a conservative estimate of their amount the actual haulage rate—to take extreme cases—would be about 70c. on Pittsburg coal and 94c. on New River; the ton-mile rates being 0.438 and 0.192c. This is still a sufficient discrepancy.

Every railroad manager, however, knows the extreme difficulty of imposing a uniform ton-mile rate in such cases as this, where its use would probably put certain districts out of competition for a certain class of trade. In the Seaboard bituminous trade the question was fought out years ago, when West Virginia coal first began to seek that market. In that case an equal ton-mile rate would have barred out the New River and Pocahontas coals entirely, in favor of Cumberland, Clearfield and Broad Top. It was only a rate, which for years did not exceed 0.25c. per ton-mile, that brought Pocahontas, for instance, into the Eastern markets, and gave it a chance to secure the place which its quality warranted in the trade. On a uniform ton-mile rate, indeed, the Pittsburg district itself would be practically out of the Seaboard market.

It does not appear, moreover, that this discrimination in rates has really affected the Pittsburg district as much as is claimed. There have been other causes in operation, and the district has really lost comparatively little of its share in the trade. The proportion of the Lake shipments furnished by three leading districts, has not varied greatly for six years past, as shown in the following table, which gives each district's percentage:

Season.	PITTSBURG.	Ohio.	West Va.
1903	56.6	23.6	19.8
1904	59.4	21.5	19.1
1905	59.8	20.3	19.9
1906	60.0	19.8	20.2
1907	55.2	24.9	19.9
1908	51.4	25.2	23.4

Up to 1907 the Pittsburg district held its own very well, the loss in its proportion coming in 1907 and 1908. In 1907 the chief gain in proportion was made by Ohio. The West Virginia percentage was about stationary until 1908, when it increased considerably. Last year, however, was rather an exceptional one, owing to the great falling off in the trade. It is probable that the West Virginia gain was not due so much to the freight rates as to the fact that the operators, with a lower mining wage rate, were able to—and did—offer lower prices, while the large Pittsburg operators maintained their quotations on the same level as in the preceding year. The lower prices counted in a poor year, and the greater proportion of the trade going to the West Virginia mines was the result of cheaper coal quite as much, or perhaps more, than of the freight rates. Pittsburg coal is claimed to be the standard of quality in the West, but much of the West Virginia coal approaches it very closely.

The Index Number for 1908

The well known index number, representing the prices of commodities, computed by A. Sauerbeck for 1908 has lately been published. This is 73, against 80 in 1907 and against 72 as the average for the 10 years ending with 1908. The most important feature in these statistics is the showing that the decline in prices from 1907 to 1908 was entirely confined to materials, the index number for them alone having been 74 in 1908 compared to 86 in 1907. In food stuffs there was no decline, the number having been 72 for each year, which was the highest figure since 1873. This accounts for the general complaint that the recent industrial depression has not been accompanied by any decrease in the cost of living. The explanation is, of course, that the harvest in the last two or three years has not kept pace with the demand for food. This is a condition that will doubtless correct itself in perfectly natural ways, but in the meanwhile the shortage and corres-

pondingly high prices impose burdens upon the bulk of the population that are hard to bear, that diminish their capacity for accumulating savings, and consequently delay the recovery of the full measure of commercial prosperity.

From the nadir of the depression in the early part of 1908 there has been a slow but steady improvement which during the first quarter of 1909 became more pronounced and is now undoubtedly gaining force. The ultra-optimistic are of the opinion that conditions are leading to an era of "unparalleled prosperity." This may be so, but it is difficult to see how it is going to come to pass until the agricultural development of the world increases so as more nearly to fit the demand. In the meanwhile it is well to remember that in spite of the undeniable revival in business the world has not yet pulled out of the slough of depression. The number of idle railway cars and unemployed men in the United States is still large, factories are still operating at less than full time, commerce in Europe is still under a cloud, and some of the unfavorable basic conditions, such as high cost of living and increasing taxation, continue to exist.

JUDGE HUNT, in the United States Circuit Court, on April 27 rendered a decision dismissing the case of Fred J. Bliss against the Anaconda Copper Mining Company and Washoe Smelter Company, and ordering each party to the action to pay its own costs. The decision is final. This celebrated case was begun in May, 1905, and cost the farmers of the Deer Lodge valley \$100,000; the cost to the companies is not known, although it must have been many times that incurred by the farmers. The case is one of the largest that this or any other Federal court has ever heard. The decision establishes another precedent.

THE GEOLOGICAL SURVEY is about to publish the results of its investigations on the smokeless combustion of coal in boiler plants. The gist of them is that the flame and distilled gases should not be allowed to come into contact with the boiler surfaces until combustion is complete. The experts of the Survey do not seem to have added anything material to the stock of knowledge in William Kent's "Steam Boiler Economy."

The Decision on the Commodities Clause

In a decision handed down on May 3 the Supreme Court of the United States has rendered a decision on the so-called commodities clause case. This involves the constitutionality and legality of the clause in the Hepburn railroad-rate law prohibiting railroads from owning and producing the commodities they transport over their lines.

Briefly summarized the decision of the Supreme Court in the cases holds the law to be constitutional, but it does not concede the contentions of the Government as to its scope. An especial exception is made as to the ownership of stock in a different corporation, which it is held does not constitute such ownership as would permit transportation under the terms of the law. It is also held that ownership of a commodity applies only to the time of transportation. If before transporting it the railroad company has, in good faith, parted with the commodity it may carry it.

The principal point of the decision is in relation to railroads holding the stock of subordinate companies, and on that important point the finding was favorable to the roads. Justice Harlan dissented on the stock feature, but otherwise the decision was unanimous.

The chief points of the decision are as follows:

1. The claim of the Government that the provision contained in the Hepburn act, approved June 29, 1906, commonly called the commodities clause, prohibits a railroad company from moving commodities in interstate commerce because the company has manufactured, mined, or produced them, or owned them in whole, or in part, or has had an interest direct or indirect in them, wholly irrespective of the relation or connection of the carrier with the commodities at the time of transportation, is decided to be untenable. It is also decided that the provision of the commodities clause relating to interest, direct or indirect, does not embrace an interest which a carrier may have in a producing corporation as the result of the ownership by the carrier of stock in such corporation, irrespective of the amount of stock which the carrier may own in such corporation, provided the corporation has been organized in good faith.

2. Rejecting the construction placed by the Government upon the commodities clause, it is decided that that clause, when all its provisions are harmoniously construed, has solely for its object to prevent carriers engaged in interstate commerce from being associated in interest at the time of transportation with the commodities transported, and, therefore, the commodities clause only prohibits railroad companies engaged in interstate commerce from transporting in such commerce commodities under the follow-

ing circumstances and conditions: (1) When the commodity has been manufactured, mined or produced by a railway company, or under its authority and at the time of transportation the railway company has not, in good faith before the act of transportation, parted with its interest in such commodity. (2) When the railroad company owns the commodity to be transported in whole, or in part. (3) When the railroad company, at the time of transportation, has an interest direct or indirect in a legal sense in the commodity, which last prohibition does not apply to commodities manufactured, mined, produced, owned, etc., by a corporation because a railroad company is a stockholders in such corporation. Such ownership of stock in a producing company by a railroad company does not cause it, as the owner of the stock, to have a legal interest in the commodity manufactured, etc., by the producing corporation.

3. As thus construed the commodities clause is a regulation of commerce within the power of Congress to enact. The contentions elaborately argued for the railroad companies that the clause, if applied to pre-existing rights, will operate to take property of railroad companies and, therefore, violate the due process clause of the fifth amendment, were all based upon the assumption that the clause prohibited and restricted in accordance with the construction which the Government gave that clause, and for the purpose of enforcing which prohibitions these suits were brought.

As the construction which the Government placed upon the act and seeks to enforce is now held to be unsound, and as none of the contentions relied upon are applicable to the act as now construed, because under such construction the act merely enforces a regulation of commerce by which carriers are compelled to dissociate themselves from the products which they carry and does not prohibit where the carrier is not associated with the commodity carried, it follows that the contentions on the subject of the fifth amendment are without merit.

4. The exemption as to timber, etc., contained in the clause is not repugnant to the Constitution.

5. The provisions for penalties are separable from the other provisions of the act. As no recovery of penalties was prayed, no issue concerning them is here presented. It will be time enough to consider whether the right to recover penalties exists when an attempt to collect penalties is made.

6. As the construction now given the act differs so widely from the construction which the Government gave to the act and which it was the purpose of these suits to enforce, it is held that it is not necessary, in reversing and remanding, to direct the character of decrees which

shall be entered, but simply to reverse and remand the case with directions to enforce and apply the statute as it is now construed.

7. As the Delaware & Hudson Company is engaged as a common carrier by rail in the transportation of coal in the channels of interstate commerce, it is a railroad company within the purview of the commodities clause and is subject to the provisions of that clause as they are now construed.

April Dividends

The accompanying table shows the total amount and amount per share, of the dividends paid during April, 1909, by a number of mining and industrial companies in the United States; and by some foreign companies:

U. S. INDUSTRIALS.	Location.	Amt. per Share.	Amt. Paid.
American As. Chemical	U. S.	\$3.00	\$544,590

CORRESPONDENCE AND DISCUSSION

Treatment of Magnetite in Copper Blast Furnace

Last summer in operating the smelter at Hadley in southeastern Alaska, I had some experience in the treatment of magnetite carrying copper pyrites. Before saying anything about the treatment, it will be of interest to note the composition of the ores treated. The main ores smelted came from the Mamie and Stevenstown mines, and had the composition shown in the accompanying table. Silica was required to make a smelting mixture and the silicious ore used carried: SiO_2 , 62 per cent.; Fe, 15; CaO , 1.3; S, 10; Al_2O_3 , 5; and some copper, gold and silver the exact amounts of which I do not feel at liberty to divulge at this time.

ANALYSES OF ORES AND SLAG.

	SiO_2 .	Fe.	CaO .	S.	Al_2O_3 .
Stevenstown.	19.3	24.1	9.7	7.7	11.0
Mamie.	14.0	42.0	2.5	3.0	7.5
Silicious ore.	62.0	15.0	1.3	10.0	5.0
Slag.	30.0	37.0	5.0	...	1.20

With these ores mixed in suitable quantities to make a smelting mixture, we find the sulphur content is rather low for making a grade of matte suitable for clean slags, also the alumina being high will cause the furnace to run slowly and further assist in the oxidation of the sulphur, giving a higher grade matte than when conditions are right for fast running.

The condition of the ore going into the furnace affects the oxidation of the sulphur. I found by taking run-of-mine ore, we kept the grade of our matte lower. In other words, by feeding large pieces of ore we got less oxidation, thereby conserving the sulphur for the matte. In this connection I might say that pieces weighing as much as 500 lb. were fed directly into the furnace. Another marked advantage in feeding coarse ore, was the reduced amount of flue dust.

By figuring the alumina in the mixture as silica I did not have any trouble with the furnace. As soon as the combined silica and alumina exceeded 45 per cent., unmistakable signs presented themselves, such as bridging and indications of an incipient freeze up. Average analysis of the slags was about as follows: SiO_2 , 30 per cent.; Fe, 37; CaO , 5; Al_2O_3 , 12. The matte produced usually ran about 45 per cent. copper.

For 24 hours I ran a slag having the

following analysis: SiO_2 , 27 per cent.; Fe, 39.6; Al_2O_3 , 10.5; CaO , 6. The slag itself was fairly clean but carried from the furnace into the settler uncombined magnetite which manifested itself above the matte as a mush. On raising the silica in the slag this mush immediately disappeared. When running this low silica slag, a curious condition showed in the connection spout, namely, an incessant sparking similar to an iron cupola, and undoubtedly due to metallic iron oxidizing in contact with the air.

B. H. BENNETTS.

Tacoma, Wash., April 30, 1909.

A Method for Calculating Slags

In calculating a charge for any type of furnace, either blast furnace or reverberatory, for smelting copper or lead ores, it would seem to be desirable that a definite formula be used for the slag calculation instead of the "hit and miss" method sometimes used, or going through the operations found in some textbooks. These are undoubtedly simple enough but lengthy, and not always practical. The calculation of lead blast-furnace charges in Furman's well known work is the most direct and simple, but involves the algebraic calculation of a new formula for each slag.

The use of the following formulas has saved me much time, and they are published with the hope that they will be of value to others. Of course, it must be understood that the charge calculated to make any given slag is only the basis to work from, and will nearly always be changed to meet the special conditions in running the furnace. These conditions are variable, such as quantity and pressure of air blast, size of the furnace, temperature, physical character of the ore and many others.

No attempt will be made in this article to describe the preliminary calculations for the matte, its quantity and tenor, but it will be assumed that this has been done and we know definitely all the available slag making constituents of the ores to be smelted. In tabulating the available amounts of slag-forming constituents in the ores, it is convenient to bring them all under three heads, viz., SiO_2 , FeO and CaO . The SiO_2 , FeO and CaO in the coke ash may be included under their respective heads in the "stock" ore, designated as silicious ore in the accompanying table. The iron in the matte and

speiss, if any, is deducted from the total FeO in the "stock" ore.

Assume that we have the following ores to smelt, considering only for our purpose their available SiO_2 , FeO and CaO and leaving out of the table the gold and silver also copper, lead, sulphur, arsenic, etc.:

	SiO_2 and Al_2O_3 , Per Cent.	FeO and MnO, Per Cent.	CaO and Earthe, Per Cent.
Silicious ore....	68.0	15.0	7.0
Iron ore.....	20.0	50.0	3.0
Limestone.....	12.0	4.0	45.0

What weight of the iron ore and limestone must be added to 100 lb. of the silicious ore to form a slag of any desired ratio of SiO_2 , FeO and CaO ?

Let S = percent. SiO_2 wanted in the slag }
 M = percent. FeO wanted in the slag } 90 %
 N = percent. CaO wanted in the slag }

A = lb. SiO_2 in the silicious ore.

B = lb. FeO in the silicious ore.

C = lb. CaO in the silicious ore.

d = percent. SiO_2 in iron ore to be added.

e = percent. SiO_2 in limestone to be added.

f = percent. FeO in iron ore to be added.

g = percent. FeO in limestone to be added.

h = percent. CaO in iron ore to be added.

l = percent. CaO in limestone to be added.

From simple algebraic equations for two unknown quantities, deduced from the slag ratio of SiO_2 , FeO and CaO , we have the following formulas:

$$\text{Required iron ore} = \frac{NB - MCe - SBl + MAI - NAg + SCg}{SfI - Mdl - Nfe + Mhe - Shg + Ndg}$$

$$\text{Required limestone} = \frac{NB + NXI - MC - MXh}{MI - Ng}$$

Suppose we wish to charge the above ores so as to make a slag of, say 40 per cent. SiO_2 , 42 per cent. FeO, 8 per cent. CaO , totaling 90 per cent. of the slag composition. The letters in the formulas would be represented as follows:

$$\begin{array}{llll} S = 40 & A = 68 & d = 0.20 & j = 0.04 \\ M = 42 & B = 15 & e = 0.12 & h = 0.03 \\ N = 8 & C = 7 & f = 0.50 & l = 0.45 \end{array}$$

Substituting these values for the letters in the formulas, we have for the required amount of iron ore,

$$\frac{(8 \times 15 \times 0.12) - (42 \times 7 \times 0.12) - (40 \times 15 \times 0.45) + (42 \times 68 \times 0.45) - (8 \times 68 \times 0.04) + (40 \times 7 \times 0.04)}{(40 \times 0.50 \times 0.45) - (42 \times 0.20 \times 0.45) - (8 \times 0.50 \times 0.12) + (42 \times 0.03 \times 0.12) - 40 \times 0.03 \times 0.04 - 8 \times 0.20 \times 0.04}$$

or

$$\frac{14.4 - 35.28 - 27.0 + 128.22 - 21.76 + 11.2}{9 - 3.78 - 0.48 + 0.1512 - 0.048 + 0.064} = \frac{983.76}{4.9072} = 200.5 \text{ lb.}$$

For the required limestone we have

$$\frac{(8 \times 15) + (8 \times 200.5 \times 0.50) - (42 \times 7) - (42 \times 200.5 \times 0.03)}{(42 \times 0.45) - (8 \times 0.04)}$$

or

$$\frac{120 + 802 - 294 - 252.63}{18.9 - 0.32} = \frac{375.37}{18.58} = 20.2 \text{ lb.}$$

For the assumed ores we have the following charge weights:

	Weight. Pounds.	SiO ₂ Pounds.	FeO Pounds.	CaO Pounds.
Silicious ore.....	100.0	68.0	15.0	7.0
Iron ore.....	200.5	40.1	100.2	6.0
Limestone.....	20.2	2.4	0.8	9.1
Total.....	320.7	110.5	116.0	22.1

From these figures we get 24.86 lb. of these slag-forming constituents, which give a slag of 39.96 per cent. SiO₂, 41.94 per cent. FeO, 7.99 per cent. CaO. A charge of 1000 lb. would be: Silicious ore, 312; iron ore, 625; limestone, 63 pounds.

Should there be no Fe in the limestone nor CaO in the iron ore, the expressions in the formulas containing the factors *g* and *h* are omitted. In regard to Al₂O₃ if the slag which it is desired to make is high in silica (a bisilicate or over), then in making up a charge include the Al₂O₃ with the SiO₂. If the slag is to be of lower silicate degree than a bisilicate, it is safer to include a part of the Al₂O₃ with the bases.

HENRY EARLE.

Denver, Colo., April 26, 1909.

Electric Smelting in Norway

In the Journal of April 24, 1909, page 844, appeared the following announcement: "The Electric Smelting Company will install at Ludvika, Sweden, two furnaces for smelting iron by electricity and two for making steel, of the type designed by Dr. Eugene Haanel, of the Mines Department of Canada."

This plant will not be erected in Sweden, but in Norway, and will consist of two electric high furnaces, of 2500 h.p. each, for the reduction of iron ores, and two steel furnaces, of 600 h.p. each, together with a rolling mill for billets and flat iron. The plant will later be extended with four more electric high furnaces and four more steel furnaces of larger size.

The above plant is being designed and will be equipped by the Electro-metall Company of Ludvika, Sweden, which designed and patented the furnaces above mentioned, and which I investigated in Sweden.

EUGENE HAANEL.

Ottawa, Can., April 26, 1909.

The Revelation of a Metallurgical Secret

On my return from Italy I have read over the accumulated numbers of the JOURNAL and have noted the editorial in the issue of Feb. 27 on the "Revelation of a Metallurgical Secret." If reference be made to page 18 of the revised edition of my "Notes on Lead and Copper Smelting," a description will be found of the Argo process as I supposed it to be, which was published in the first edition of that book in 1897. The chain of evidence leading to the conclusion is given in detail and the deduction agrees with the "revelation" in every respect, even to the electrolytic process being better and cheaper. Philadelphia, Penn. H. W. HIXON.

April 30, 1909.

[The fact that Mr. Hixon, so cleverly deduced the Argo process does not detract from the interest of the paper by Mr. Pearce or make that paper otherwise than a revelation. However, Mr. Hixon deserves all praise for his high metallurgical knowledge and keenness in deduction which led him to the solution of a problem that for many years had baffled many inquirers. He must, of course, be gratified to have an official pronouncement that his solution was correct.—Ed.]

Diamond Mine in Pike County, Arkansas

In connection with the discussion of the diamond region of Arkansas in the JOURNAL of March 20 and Feb. 13, 1909, by John T. Fuller and Prof. John C. Branner, formerly State geologist of Arkansas and now professor of geology at Stanford University, Cal., I can readily realize how Professor Branner feels in regard to the occurrence of diamonds in Arkansas, and I distinctly remember his stating to me that he had said nothing at the time of his survey, because of the unwarranted excitement which was then spreading through Arkansas.

In the company of Dr. J. S. Diller, of the Geological Survey, I visited Elliott county, Ky., and after spending a number of days in a region in which everything was present in the way of rock associations excepting the diamonds themselves, we failed to find them. Work has been indefatigably carried on there for a number of years, and much money has been spent without finding a single diamond. It was in view of this fact that Doctor Branner was restrained from prophesying more than he did.

On my visit to the Pike county peridotite locality in January, 1907, I remained there about a week with the owners of the property and devoted more than half of that time to a diligent, painstaking search without finding a single diamond. Dr. Henry S. Washington, who visited the locality before my arrival, had the same ill

success. He was there during the period of my visit and remained after my departure. There was nothing strange, however, in the failure to discover diamonds; because if they should exist in the proportion of 1/5 to 1/2 a carat to a load, which is the proportion of the South African yield, there would not be more than one part of diamond in from 1,000,000 to 10,000,000 or 20,000,000 parts of material. Then again, the diamond may be more or less coated with earth or mud, which would render it hard to detect.

Doctor Washington and myself found Doctor Branner's maps most carefully made and of the greatest value in our work, as were also his geological deductions, which were admirable. Knowing both Mr. Fuller and Doctor Branner as I do, I feel confident that both have meant well, and that neither would wish to discredit the other. I hope there will be no controversy where there should be nothing but harmony and good fellowship; and that the ultimate result of the property may warrant the work being carried on there.

GEORGE F. KUNZ.

New York, April 26, 1909.

Mining in the Alamos and Artega Districts

As a constant reader of the JOURNAL I take the liberty of making a few comments on the article which appeared in the issue of April 3, 1909, entitled "Mining in the Alamos and Artega Districts," by George M. Bloomer. Touching what is called Contact No. 1, Alamos district, the article in question is misleading. The principal misstatements in the article are:

Of the various mines mentioned, the Quintera and Zambona are designated as the only ones under actual operation. As a matter of fact, the Zambona, Santo Domingo and Promontorio are the mines which are being worked, the Quintera having closed down several months ago.

The Promontorio neither was nor is being equipped by the American company which bought the Mexican concern in 1905. A second American company has lately taken hold of this property and is only just commencing operations. The first company did nothing.

The Zambona workings are only 730 ft. in depth, not 1050 ft. The Teresa has no indications nor work on it to deserve at all to be termed a promising prospect. The Alamos mountain is far from being thoroughly mineralized, the mineralization being practically limited to the contact on its extreme west. Wood and water are not abundant, and "water-power opportunities" are entirely absent. The view purporting to show the Zambona mine and reduction works is not a view of the Zambona at all.

AMOS J. YAEGER.

Minas Nuevas, Son., Mex., April 19, 1909.

Chronology of Mining, April, 1909

April 1—Explosion in the Echo mine of Buery Brothers Coal and Coke Company, Fayette county, W. Va.; four men killed—John Mitchell day was celebrated by 300,000 miners in Pennsylvania—Utah Fuel Company fined by the United States Government for conspiracy to defraud the Government of coal lands.

April 2—Coal strike inaugurated at Alberta, Canada.

April 4—Fire broke out on the eighth level of the North Mahanoy colliery, Pennsylvania.

April 8—Second meeting of anthracite miners and operators in Philadelphia.

April 9—Explosion at Du Pont Powder Works, Wayne, N. J. Damage to property, 20,000—Oil still at Point Richmond, Cal., exploded; two men killed; loss, \$50,000—Dynamite explosion in Berwind-White Coal Company's mine at Windber, Penn.; seven men killed, four entombed.

April 10—Riot at Velardeña, Durango, Mexico. Six policemen killed.

April 13—John Fritz medal awarded to Charles T. Porter at a joint meeting in New York of the Mining, Civil, Electrical and Mechanical engineers—Gas explosion at Superior coal mine at Linton, Ind.; 20 killed.

April 14—Sale of Alaska Copper and Coal Company's Bonanza mine to J. P. Morgan and the Guggenheims.—Eight hundred union coal miners of the Bend Coal Corporation, Johnstown, Penn., go on strike—John Mitchell addressed the Pennsylvania legislature on the "Ideals of the Trade Union Movement."

April 15—Gas explosion at George's Creek Coal and Iron Company's mine, Farmington, Va. Three men killed—Over 600 officers of the United States Steel Corporation met at Scottsdale, Penn., to receive reports from the commission which visited coal industrial plants in Europe.

April 16—W. K. Niver Coal Company sold by receiver to J. V. McDonald, of New York, for \$200,000.

April 17—Bald Butte Mining Company passes into hands of receiver—Federal Mining and Smelting Company passes regular quarterly dividend on common stock—J. O. Rogers appointed receiver for Lanyon Zinc Company.

April 18—The directors of the United States Smelting, Refining and Mining Company purchased 100,000 shares of the company's stock from R. D. Evans—Consolidated Silver Cobalt Mines, Ltd., assumed control of the Greene-Meehan Mining Company, Cobalt.

April 19—Pittsburgh Coal Company cancelled contract with Pittsburgh Terminal Railroad and Coal Company, to take effect October 31—Meeting of the anthracite coal operators' representatives in New York to decide upon policy toward miners' wage scale—Explosion of gas at Elhora mine, Highland Coal Company,

Warnock, O. Six men injured—La Rose Consolidated Mining Company acquires control of the Lawson mine, Cobalt.

April 20—Judge Goff, of the U. S. Circuit Court of Appeals issues order restraining Chesapeake & Ohio railroad from increasing freight rates on coal from West Virginia points.

April 21—Bill filed in Common Pleas Court to have directors of the Tonopah Belmont Mining Company, held criminally liable for new stock issued last June.

April 22—Isabella-Connellsville Company voted first appropriation of \$2,000,000 to begin construction work of plant on the Monongahela river—Plans launched for the merger of the Isabella Coal and Coke Company and the Tower Hill Coal Company, Fayette county, Penn.

April 23—Cave-in of M. & B. mine, Duenweg, Mo. Three men killed.

April 24—Judge E. H. Sullivan appointed A. Starke Oliver as temporary receiver for the Idaho Smelting and Refining Company in place of John Mocine.

April 26—Judge Lacombe in the United States Circuit Court discharged A. R. Ledoux as receiver of the Harney Peak Tin Mining, Milling and Manufacturing Company.

April 27—Judge Hunt dismissed the "smoke" case of F. J. Bliss vs. Anaconda Copper Mining Company and the Washoe Smelter Company—Anthracite miners meet at Scranton to discuss tentative plans for settlement with operators.—The New York & Virginia Copper Mining Company was placed in the hands of receivers.

April 28—The Tri-district convention of the United Mine Workers at Scranton, Penn., unanimously adopted the three-year extension of the present wage agreement.

April 30—The three-year wage agreement between the anthracite miners and operators signed.

The Anthracite Settlement

An agreement was finally reached last week between the operators' and miners' committees with regard to the mining of anthracite coal. The agreement was ratified by the district convention of the miners, and has been signed by the representatives of both parties. In effect it extends for three years the settlement made by the Anthracite Strike Commission in 1903, which has been in force ever since. There are some slight changes, made as a concession to the miners, but they are not of great importance. The text of the new contract is as follows:

THE AGREEMENT

Whereas, pursuant to letters of submission signed by the parties interested in 1902, "All questions at issue between the respective companies and their own em-

ployees whether they belong to a union or not," were submitted to the Anthracite Coal Strike Commission to decide as to the same and as to "the conditions of employment between the respective companies and their own employees," and the said Strike Commission under date of March 18, 1903, duly made and filed its award upon the subject matter of the submission and provided that said award should continue in force for three years from April 1, 1903, and the said period has expired.

And whereas, By agreement dated May 7, 1906, it was stipulated the "said award and the provisions thereof and any action which has been since taken pursuant thereto, either by the Conciliation Board or otherwise, shall be extended and shall continue in force for three years from April 1, 1906, namely, until March 31, 1909, with like force and effect as if that had been originally prescribed as its duration."

Now, therefore, it is stipulated between the undersigned, in their own behalf and so far as they have power to represent any other parties in interest, that the said award and the provisions thereof and any action which has been since taken pursuant thereto, either by the Conciliation Board or by written agreement between representatives of the employers and employees, shall be extended and shall continue in force for three years from April 1, 1909, namely, until March 31, 1912, with like force and effect as if that had been originally prescribed as the duration.

It is further covenanted and agreed as follows, viz.:

First—The rates which shall be paid for new work shall not be less than the rates paid under the Strike Commission's award for old work of a similar kind or character.

Second—The arrangement and decisions of the Conciliation Board permitting the collection of dues on the company property and the posting of notices thereon shall continue during the life of this agreement.

Third—An employee discharged for being a member of a union shall have a right to appeal his case to the Conciliation Board for final adjustment.

Fourth—Any dispute arising at a colliery under the terms of this agreement must first be taken up with the mine foreman and superintendent by employee, or committee of employees directly interested, before it can be taken up with the Conciliation Board for final adjustment.

Fifth—Employers shall issue pay statements designating the name of the company, the name of the employee, the colliery where employed, the amount of wages and the class of work performed

The Meyer & Charlton mine yielded revenue for 1908 (*South African Mining Journ.*, March 13, 1909) to the amount of £251,700; the expenditure was £147,622, leaving a gross profit of £104,107.

Questions and Answers

Inquiries for information are answered in this department as promptly as possible, but more or less delay is often unavoidable. Many inquiries involve a good deal of investigation and these can be answered only when the general interest in the subject is conceived to justify the expenditure of the time required. Correspondents should refrain from asking for advice that ought to be obtained by professional consultation with an engineer. We will not answer questions pertaining to the value of specific mining enterprises. Inquiries should be framed concisely.

"BLUE GAS"

What is the address of the owners of the United States and Canadian patents of this gas, which was described in the JOURNAL of Feb. 27?

A. B. C.

The Blaugas Company of America, 1 Platt street, New York; the Blaugas Company of Canada, 671 St. James street, Montreal, Canada.

THE DEEPEST SHAFT

What is the deepest mining shaft in the United States? What is the deepest in the world?

F. B. McK.

The deepest shaft in the United States, and also in the world, is Tamarack No. 3, in Michigan, which is 5253 ft. deep. Europe has no shaft of anywhere near that depth. So far as we are aware, the deepest is at a colliery in Belgium, and is 3773 ft. deep.

RADIUM

Please inform me if the name "radium" was not mentioned in some chemical-textbook, 18 or 20 years ago, as a supposed element. Of course, I am aware that the element was not actually known previous to the Curie discovery.

D. W.

Radium was discovered by Madame S. Curie, P. Curie and M. Bemont in 1898. The word "radium" was unknown prior to 1898. It is not mentioned in any textbook, scientific journals, nor periodicals before 1898, as far as we are aware.

TANTALUM ORE

What is the market for tantalite or other minerals containing tantalum?

R. L. G.

The demand is extremely small. So far the principal use for tantalum is as a filament for incandescent electric lamps. Inasmuch as the quantity required for a single lamp of the ordinary size is only about 1/100 of a gram, it will readily be perceived that a ton of ore will go a long way in this business. However, tantalum is a metal that appears to have some highly useful properties, and without doubt an increased demand for it in the arts will develop.

DETERIORATION OF DYNAMITE

Does dynamite deteriorate any faster when kept in the frozen state than when kept thawed? At this mine the dynamite used is du Pont, less than six months old, but is kept frozen until a few hours be-

fore being used. We are very much troubled by gas from the "powder"—nitrogen oxides, I suppose. Good dynamite, when well thawed, has a feeling similar to that of a well ripened pear or peach—if pressed by the finger it retains the imprint. When the dynamite gets old it becomes more like soft rubber. Some of the "powder" we are using is more like this. Can you give me advice as to the proper keeping of dynamite so it will not deteriorate?

A. O. C.

If dynamite is kept in a frozen condition or kept in a dry, well ventilated magazine, whose temperature does not reach much above 80 deg. F., there is very little chance for the dynamite to deteriorate. As regards the gas from the powder, of which A. O. C. complains, it would be helpful if he would state whether he is using the nitroglycerin dynamite or gelatin dynamite, and whether he is using it in open or closed work.

PHOSPHATE ROCK

What are the principal producing phosphate fields of the United States, and what variety of rock does each produce? What new phosphate fields have been discovered in recent years?

A. P. B.

The principal phosphate producing fields of the United States are situated in Florida, Tennessee and South Carolina, named in the order of their importance. In 1908, Idaho and Arkansas both produced a few thousand tons. Florida produces three grades of phosphate, viz.: hard rock, land pebble and river pebble. Tennessee produces brown rock and black rock. South Carolina produces land rock and river rock.

Among the new discoveries, the most important are those of the western United States and the islands of the South Pacific seas. The former embraces a large area in southeastern Idaho, southwestern Wyoming and northeastern Utah, and is reported to contain an extraordinary supply of black oolitic phosphate, much like the Tennessee rock in appearance, and carrying about 70 per cent. bone phosphate. The phosphate industry in the South Pacific islands has developed greatly in recent years, and in 1908 many important discoveries were made.

BARYTES

What is the Ba SO₄ content of the average commercial dry-ground and water-floated barytes? What is the lowest grade of crude barytes sent to the grinding mills? What is the average Ba SO₄ content of the artificial sulphate, called blanc fixe? What is the approximate cost of reducing Ba SO₄ to BaS, and what is the most economical method? Is barium sulphate legitimately used in the paint, paper and rubber manufactures? Would a lode or deposit of barytes, containing, say, 200,000 tons of the mineral assaying

90 to 94 per cent. Ba SO₄, and having no lime or iron as impurities, be of much value, provided it be accessible and amenable for mining at 85c. per ton?

B. T.

The Ba SO₄ content in commercial ground or floated barytes is in the neighborhood of 98 per cent. In general, it may be said that no material containing less than 90 per cent. Ba SO₄ is sent to the grinding mills. Of course a great deal depends on what the impurities consist of. Iron, if present in quantities greater than enough merely to stain the mineral is objectionable. Calcium fluoride (fluorite) is objectionable even in small quantities, owing to the obnoxious nature of the gas evolved in the bleaching operation. Limestone, while it has little effect upon the color of the finished product, consumes acid, and should not be present in large amount. Small percentages of minerals that do not affect the color of the barytes, or consume acid in the bleaching process, are not objectionable.

The artificial sulphate, blanc fixe, should be practically chemically pure. The usual procedure in the preparation of this material is to mix the crude barytes with coal containing little ash, in the proportion of four parts by weight of barytes to one of coal. The mixture is heated to a bright red, in a reducing atmosphere, for from 2½ to 3 hours. The charge then contains from 60 to 70 per cent. of soluble barium sulphide, the remainder being chiefly barium carbonate, which may be dissolved in either nitric or hydrochloric acid and the corresponding salt recovered. The sulphide is then dissolved in water, and the chemically pure sulphate precipitated with either sulphuric acid or salt cake. If salt cake is used as a precipitant, the purity of the final product depends upon the purity of the salt cake. We do not know the cost of reducing barium sulphate to barium sulphide.

The value of barytes as a pigment is a recognized one, and it is also used legitimately in other manufactures. Its use becomes improper only when secretly employed to give weight to different manufactured and food products.

Regarding the deposit of barytes described by B. T., we prefer not to express an opinion, as there are so many considerations entering into the question as to whether or not it is commercially available, respecting which we have not been informed. Anyway, this is a matter for reference to a consulting engineer.

According to *Engineering News*, April 29, 1909, during 14 years up to 1906 there were in Prussia, 13 firedamp explosions with 722 deaths, or 1.49 to each 10,000 workmen in each year. In England the same period shows a total of 1248 firedamp victims, or 1.2 killed each year to every 10,000 workmen.

Personals

Mining and metallurgical engineers are invited to keep **THE ENGINEERING AND MINING JOURNAL** informed of their movements and appointments.

W. DeL. Benedict has returned to New York.

J. F. Erdlets, Jr., of Salt Lake City, Utah, has been in New York on business.

Alexander Agassiz, president of the Calumet & Hecla, is at the mines on his semi-annual visits.

S. M. Greenidge, of Cananea, Mexico, is examining a group of silver-lead mines near Monterey, Mexico.

C. Colcock Jones has returned to Los Angeles, Cal., from an examination of mines in the Yerington district, Nevada.

W. E. Carpenter has succeeded F. G. Goggin as superintendent of the Atlantic stamp mill in the Lake Superior district.

R. Livingstone, late assistant mines inspector of Alberta, has been appointed chief inspector in place of Norman Fraser, resigned.

Frederick Lyon has been chosen a director of the United States Smelting, Refining and Mining Company in place of R. D. Evans, resigned.

Roscoe Powers, superintendent of the St. Joseph Lead Company's mines in Missouri, was seriously injured last week in an automobile accident.

F. A. Ross, manager of the Daly Reduction Company, left Hedley, Similkameen, B. C., a short time ago on a business visit to New York.

Dr. Milton Hersey, of Montreal, has given \$100,000 to the metallurgical department of the faculty of Applied Science of McGill university.

W. H. Jeffrey has resigned his position as manager of the Chambers-Ferland mine at Cobalt, Ont. His successor is C. Watson, recently assistant superintendent of the Nipissing mine.

Prof. William Nicol, of Queens University, Kingston, Ont., has undertaken to give \$40,000 for the erection of a new mineralogy building in connection with the Kingston School of Mines.

George E. Gay, of Uniontown, Penn., has been appointed a member of the Board of Bituminous Coal Mine Inspectors of Pennsylvania, in place of George Whyel, whose term has expired.

It is reported that M. K. Rodgers, of Seattle, Wash., is about to resume the management of the Nickel Plate mine, at Hedley, B. C., which property Mr. Rodgers developed in the first place.

Walter Bean, of Denver, Colo., and A. G. Merrill, of Los Angeles, Cal., are making an examination of the Yale Min-

ing Company's (Daly estate) Nickel Plate group, in Hedley camp, Similkameen, B. C.

Rudolph Agassiz, the new president of the Osceola Consolidated and other companies that have recently come under Calumet & Hecla control, is visiting the Lake Superior district looking over these properties.

Norman Fraser, for some time one of the provincial government coal-mine inspectors, in Alberta, Canada, has been appointed superintendent of the Crow's Nest Pass Coal Company's colliery, at Michel, B. C.

W. H. Wardner, formerly general superintendent of the Bamberger-De La Mar mines at De La Mar, Nev., has been appointed general manager of the Golden Star Mines Company at Kofa, Yuma county, Arizona.

G. F. Greenwood, of Montreal, president of the Mexican Northern Power Company, has gone to Mexico, in connection with starting construction work on a plant for furnishing power to a large mining district in Chihuahua.

A. H. Reed has resigned as mine superintendent with the Longdale Iron Company, Longdale, Va., and has accepted a position as mining and mechanical engineer with the Independent Phosphate Company, Columbia, Tennessee.

James Gayley has been awarded the Elliott Cresson medal of the Franklin Institute, of Philadelphia. This was presented to Mr. Gayley in recognition of his invention of the dry-air blast process in the manufacture of steel and iron.

Obituary

Charles E. McCullough died at Kewanee, Ill., April 24, aged 59 years. He was prominent in the organization and management of the Western Tube Company, Kewanee, from which he retired in 1908, when this company was absorbed by the National Tube Company.

Societies and Technical Schools

American Peat Society—The New York section will meet at Syracuse, N. Y., May 15, when a number of papers on the utilization of peat for fuel and other purposes will be presented.

American Foundrymen's Association—This society and the American Brass Founders' Association will hold a joint convention at Cincinnati, O., May 18-20. Dr. Richard Moldenke is secretary.

American Chemical Society—The summer meeting of the American Chemical Society will be held in Detroit, Mich., June 20 to July 2. The council of the society will meet on June 28 and the

opening session of the general meeting will be on the morning of June 29.

Titles of papers to be read at the summer meeting should be sent to Charles L. Parsons, secretary, Durham, N. H., by June 7.

Canadian Western Mine Operators' Association—A new agreement has been made between the Western Coal Operators' Association, representing most of the coal-mine operators in southern Alberta and southeastern British Columbia, and District No. 18, United Mine Workers of America, representing practically all the men employed at the mines of those districts. The old agreement expired March 31, and all important points in the proposed new agreement were disposed of at a convention of representatives of both operators and miners held here recently. The vote of the miners afterward taken resulted in a large majority in approval of acceptance of the new agreement.

Appalachian Engineering Association—This society will meet in Roanoke, Va., May 8. The following papers will be read: "Lead and Zinc Ores in Wythe and Pulaski Counties," by M. M. Caldwell, of Roanoke; "Organization and Engineering Difficulties of the Virginian Railway," by William N. Page, of Washington; "The Virginian Copper District," by Dr. Thomas L. Watson, State geologist of Virginia; "A Geologic Engineering Code of Ethics," by Baird Halberstadt, of Pottsville, Penn.; "Properties and Uses of Mineral Gypsum," by Dr. Frank A. Wilder, of North Holston, Va. At a banquet in the evening, tendered by the Chamber of Commerce, of Roanoke, President L. E. Johnson, of the Norfolk & Western railway, and others will speak.

California Mineowners—Mineowners in California have agreed to test in some manner the new eight-hour law which goes into effect in the mines on May 6. A judicial determination of the constitutionality of this law is desired by the mineowners. In Nevada county an eight-hour rule has for some time been enforced by the miners' unions, but in other counties this is not the case. The mineowners at first thought of contesting that portion of the law which makes eight hours compulsory in the mills. It was later determined, however, to keep on just the same as at present in the mills without paying any attention to the new law until someone started a litigation on the subject. It is in the underground work that the change will come on May 6 when the law goes into effect. Lawyers will be employed to advise the mineowners, who are arranging to stand together in any possible contest with the labor unions.

Over in Nevada, where they have a new eight-hour law for miners the Nevada Consolidated Mining Company at Ely is about to test the constitutionality of this law, where it provides for eight hours in the open cuts and drifts of mines.

REVIEWS OF IMPORTANT EVENTS

San Francisco

April 30—As spring opens and miners and prospectors have again commenced active work except in the higher mountain ranges where the snow still lies deep, numbers of accounts of new strikes and discoveries are printed in local newspapers in mining districts. Some strikes have been made this month in old quartz mines on which work has been continued during the winter. The most notable of these is that in the Sixteen-to-One mine at Alleghany, Sierra county, on the same belt as the Tightner. The strike was made in the main tunnel of the mine about 250 ft. from the entrance.

The Central Consolidated mine at Banner Mountain, seven miles east of Grass Valley, in Nevada county, has showed up a valuable body of ore. The "jewelry rock" is being stored. The shaft is only 400 ft. deep.

Another noteworthy strike is that in the old Chippis quartz mine at Sierra City, Sierra county, where they have recently found rich ore in a new vein. The length of the shoot is not yet determined. Still another find is that in the Independence mine in El Dorado district, El Dorado county.

The amount due on the foreclosure of liens on the Wildman-Mahoney mines at Sutter Creek, Amador county, has been paid by the Alabama people, thus redeeming the property from indebtedness. The mines were sold about a year since to satisfy judgment. W. Murphy and associates are now in full possession of the property, and the reopening of the mines is supposed to be assured.

The effect of the decision rendered by the courts at Redding last week is to give absolute possession of the Brunswick mine at French Gulch, Shasta county, to H. D. Lacey, he having won the suit. The mine is a productive one and is well developed.

On the petition of a stockholder in the Keane Wonder mine, of Inyo county, a court in this city has restrained the sale of the property under a deed given by the directors to W. Gregg to secure an indebtedness to the Frances-Mohawk Mining and Leasing Company.

A suit has been filed in Placer county by which the Long Beach Asbestos Mining Company, of Long Beach, Los Angeles county, seeks to quiet title to three asbestos claims in Green Valley, near Towle, Placer county. The claims comprise some 50 acres of mining ground.

Last week the large ore bins of the Balaklara Consolidated Copper Company at Coram, Shasta county, collapsed and dumped about 1000 tons of ore, covering the tracks and damaging the power line. Temporary repairs have since been made, and the smelter will not have to close.

The Siskiyou Dredging Company has been organized at Oroville, Butte county, to install a dredge on 225 acres of land which have been purchased in Siskiyou county. The officers are George W. Carr, president; J. J. Hamlyn, vice-president; J. C. Osgood, secretary, and H. G. Peaks and W. R. Bassick, directors. Mr. Hamlyn has had long experience in dredging affairs at Oroville.

Fred S. King, of this city, as trustee of Eastern men represented by John Filious, of Oakland, has taken over the holdings of gypsum deposits in Death Valley, formerly owned by the Death Valley Chemical Company. A large plant is to be put up.

Butte

April 28—Thomas F. Cole, of Duluth, one of the heavy stockholders and original promoters of the North Butte and Coalition companies, was in Butte several days last week, making an inspection of the properties of the companies in which he is interested. Bondholders of the Kimberly-Montana Gold Mining Company have instituted action asking that a receiver be appointed for the company and that the mortgage given to secure the bonds, be foreclosed. The complaint alleges that the company is deeply involved in litigation and in debt and that the assets of the company are being wasted.

The annual report of the North Butte Mining Company for the year ending Dec. 31, 1908, covers a period of 10 months during 1908, operations having been suspended for two months. The cost of production averaged about 8c. per lb. Of the ore shipped from the mine 35 per cent. was first class, which is an unusually high percentage for a Butte mine. The net profits for the year were \$1,863,782, which, divided among the 400,000 shares of issued stock, would make \$4.66 per share; this compares with \$3 paid out in dividends.

For the past several weeks much interest has been centered in the struggle between the Great Northern and the Chicago, Milwaukee & Puget Sound railways to secure the most advantageous right of way for a line running north from Coram, along the north branch of the Flathead river, and into the coal lands

in Alberta, Canada. Survey parties have been busy in the locality for some time past but it is only recently that steps have been taken by either road to secure the land necessary for the right of way. Options, deeds and condemnation suits are being filed by the contesting parties daily, and the entire locality is in a state of excitement owing to the keen rivalry of the two roads. It is stated that there is but one course which is feasible for the construction of the proposed branch and that each of the companies is bent upon securing this route.

Denver

May 1—The mining and milling industry in the State of Colorado is very dull indeed, partly due to uncertainty of tariff legislation and the low price of metals, but more largely owing to the terrific winter experienced, and which one might say is still with us, for a blizzard prevailed yesterday. The snowfall in the mountain mining districts has been a record breaker with no signs at present of its melting, so that it will be very late this summer before everything is in full swing again.

To offset this, there is a strong feeling of optimism in the mining fraternity of the State, encouraged by the advance in metal prices, and in the various camps preparations are being made for active operations, not only on working mines, but what is more remarkable, on a large number which have been closed down for years. These preparations are at present chiefly of a financial character, as climatic conditions preclude shipping or surface work and improvements at this date. The gold mines of the State are least affected, and keep on the even tenor of their way.

The Eclipse tunnel, on Battle mountain, is said to have opened a large body of ore. In like manner, the Damon, near the W. P. H. and the Jerry Johnson, has just opened a large body of pay ore. The Black Belle, on Beacon hill, also by crosscutting from the shaft at the 300 level, is reported to have struck 2½ ft. of high-grade ore. In the Victor mine, now under lease, the ore was discovered by a level caving and exposing the vein. One of the most efficiently and economically handled gold mines in the district is the Crescent, on Raven hill, which is reported to have produced about 2000 tons during April. The production of this district for April is given at 59,700 tons of a gross value of \$1,351,675.

Indianapolis

May 3—The United States Steel Corporation and the Brazil Block Coal Company, the latter of Brazil, Ind., are planning to open all the old mines and sink many new shafts in the territory controlled in Indiana and Illinois, which means an increase of 100 per cent. in the output of the districts separated by the Wabash river. To this end the Steel Corporation is securing titles to between 5000 and 6000 acres of coal lands in the Illinois district. Four or five new shafts will have coal rights for about 10,000 acres of unworked coal land. It is understood the prices paid for coal rights for these lands averaged \$125 an acre; and from these figures coal rights alone cost \$1,250,000.

Salt Lake City

April 29—It is stated that the 1,705,322 cu. yd. of overburden so far removed from the porphyry ore deposits of the Utah Copper Company will average slightly under 1 per cent. copper. General Manager Jackling has proposed a leaching method for extracting the copper in this material and it is now reported that an experimental plant of moderate capacity will be constructed at Garfield, and the proposed metallurgy of this material demonstrated on a fairly liberal working scale.

Ore shipments from Tintic mines for the week were 183 carloads, 110 of which went to the Knight smelter and 73 to the valley smelters. The shipments from the individual mines were as follows: Centennial Enreka, 40; Sioux Consolidated, 14; Bullion Beck, 1; May Day, 2; Enreka Hill, 1; Eagle & Blue Bell, 1; Mammoth, 9; Black Jack, 3; Plutus, 1; Yankee Consolidated, 1; Iron Blossom, 40; Colorado, 24; Dragon Iron, 31; Brooklyn, 5; Black Jack, 3; Beck Tunnel, 7.

The stock of the Moscow Mining and Milling Company which owns the Burning Moscow and six other claims in the Star district, Beaver county, was listed on the Salt Lake Mining Exchange. In its statement to the Exchange the company reports that 25,000 tons of ore are now developed in the mine and that 20 men are employed.

It is announced that the Highland Boy smelter of the Utah Consolidated, near Murray, is to be dismantled, a force of men having started at this work recently. All furnace steel is to be sent to Tooele, together with such other equipment as can be utilized in the new International smelter.

Goldfield, Nevada

April 27—The Nevada California Power Company has closed a contract to furnish the Bullfrog Pioneer Company with electric power. The surveys for the line have been made and construction work will commence at once. It is thought that about 1000 h.p. will be used in the Pioneer district.

Ore shipments from Tonopah mines for

the week ending April 24, were: Tonopah Mining, 3300 tons; Montana Tonopah, 1030 tons; Belmont, 700 tons; MacNamara, 350 tons; West End, 130 tons and Midway, 100 tons.

The date for the session of the American Mining Congress to be held in Goldfield has been changed to Sept. 27 in order to secure the advantages of reduced railroad rates. Tickets sold for this purpose will have a return limit of Oct. 31.

Production of the Goldfield mines for the week ending April 24, was: Consolidated, 3850 tons, valued at \$173,250; Combination mine 630 tons, \$28,350; Hampton stope, 210 tons, \$147,000; Florence, 700 tons, \$31,500, and 35 tons high grade, \$4900; other sources handled by Western Ore Purchasing Company, 890 tons of ore and concentrates, \$186,900, and by Nevada Goldfield Reduction Company, 755 tons, \$37,750, making a total valuation of \$609,650.

Toronto

May 1—Dr. R. W. Ells, of the Canadian Geological Survey, stated, on April 29, to the Senate Committee on Mines and Minerals, at Ottawa, that the oil-shale deposits of New Brunswick were far richer than those of Scotland, from which the operators annually obtain 62,000,000 gal. of oil and 50,000 tons of sulphate of ammonia. This was admitted in Scotland as the result of experiments with New Brunswick samples. The Scotch shale produced 30 to 40 gal. of oil per ton, while the New Brunswick shale would produce from 60 to 110 gal. per ton and was far richer than the Scottish in sulphate of ammonia. The New Brunswick shale district extend for 70 miles from Dorchester to Horton, and seven seams had been discovered.

The road to Elk lake and Gowganda is now absolutely impassable for vehicles of any kind, and the post office has issued a notification that only letters will be forwarded, other classes of mail being held until navigation opens.

The government sale of Gowganda town lots by tender last month realized better prices than the first sale in March, the average being \$152.95, and the highest price \$1010 per lot.

About a month since the Ontario Department of Mines was notified of a supposed discovery of coal on the north shore of Lake Superior. Specimens were forwarded to the department and submitted to analysis. It is declared by them to be a carboniferous substance, but of little value commercially.

Hon. Sydney Fisher, Canadian minister of agriculture, has given notice that he will introduce in Parliament a bill to create a permanent commission on the conservation of the natural resources of Canada. It will give effect to the agreement arrived at during the international conference on the subject at Washington

last month. It is expected that the commission will be named as soon as the bill becomes law, and will consist of from 25 to 30 representative Canadians.

The Ontario government is offering for sale by tender 1000 acres of mining land at the northeast corner of the Gillies limit, in the Cobalt district. This does not include the 40 acres containing the Provincial mine. The land is offered in 20-acre blocks, and the sales will be on a cash basis, with a 10-per cent. royalty on the output in perpetuity. Successful bidders will be required to spend \$400 in development yearly for seven years. Tenders will be received up to June 1 next.

Prospectors are flocking into the Seine River goldfields east of Fort Frances, Ont. The country round Glenorchy is staked out for miles and discoveries of rich quartz are reported.

In the course of construction work on the Grand Trunk Pacific railway, near Portage lake, northwest from Sturgeon lake, in northwestern Ontario, a copper outcrop was laid bare in a rock cutting. A claim was registered by H. J. Mackenzie.

Paris

April 20—New efforts are being made to find the coal seams lying under the Lorraine oolitic-iron deposits. A local company has undertaken borings in the Haute Marne, on the boundary between that and the Vosges. The Société des Houillères de la Moselle, subsidiary of the Société Lorraine des Charbonnages Réunis, has erected a drill at Jeuvoncourt, half way between Mont sur Moselle and Gironcourt, where work has begun.

The results obtained by Mortages & Grignon at Andavakoera (Madagascar) have caused new companies to be promoted at Lille and Marseilles with a view of prospecting for further lodges. The Marseilles group will be known as Madagascar-Nord and the Lille group as Société Civile des Mines d'Or de la Lory. Work will be started after the rainy season under the superintendence of the mining engineers sent over. Meanwhile the output of the Andavakoera deposits continues quite satisfactory. They have temporarily suspended the use of native labor owing to its inferior efficiency.

The International Syndicate, headed by the Solvay firm, has acquired new interests in France by becoming owner of most of the shares in the Salines de Tonnoy near Nancy.

The Compagnie Française du Platine is endeavoring to obtain closer control over the output of platinum in Russia. Next to them the chief producer is the estate of Prince Demidoff, owning the placers of Nijni Tagilsk. But the Russian government seems bent on opposing the company's efforts, in order to prevent the deposits becoming the property of a foreign company.

Mining News from All Parts of the World

New Enterprises, Installations of New Machinery, Development of Mines and Transfers of Property Reported by Special Correspondents

THE CURRENT HISTORY OF MINING

Alaska

FAIRBANKS

Fairbanks creek is holding its own after having been worked for many years. Keely & Parker are making preparations for extensive work. Wobber & McCarthy are opening up their new quartz claims on Alder creek, and Johnny Scott is assembling a large crew for sluicing which will be done night and day during the full season. Ester creek is the busiest one in the entire country, and its production will compare more than favorably with any preceding year.

Arizona

COCHISE COUNTY

Copper Queen—Daily shipments of copper ore from Bisbee to Douglas are 35 carloads. The Sacramento shaft will be sunk from the 1200- to the 1400-ft. level. Seven furnaces are in operation. April output, 8,000,000 pounds.

Denn-Arizona—The main shaft is now 1265 ft. deep, 65 ft. having been sunk since work was resumed this spring.

Calumet & Arizona—Low-grade copper ore was encountered in the Powell shaft at a depth of 375 ft. The foundation for the new electric hoist was completed recently.

GILA COUNTY

Superior & Boston—The McGraw shaft is to be completed to the 400 level by June 1.

Arkansas

JOHNSON COUNTY

W. H. Taylor has resumed operations at Spadra. He intends to enlarge the capacity of the coal mines to 1000 tons daily, and to install mining machines.

California

AMADOR COUNTY

Kennedy—This mine, at Jackson, has been closed down some days owing to an accident in the shaft.

Mitchell—A year's extension has been given on the option to Cranmer Brothers; they have found a new orebody entirely distinct from the old one. The 10-stamp mill has been put in good order.

BUTTE COUNTY

Big Blue Lead—The first clean-up of this property has been made with satis-

factory results, the gravel coming about up to expectations. The force of men is to be increased.

Mercedes Mining Company—This company has been incorporated to work quartz mines in the Forbestown district. The directors are Geo. S. Smith, of Oakland, and R. A. Nayo and S. Lague, of Oroville.

EL DORADO COUNTY

Indian Diggings—J. J. Crawford & Brother, of Oakland, are about to commence work on the John Culick claim.

Loveless—This mine, at El Dorado, has been bonded to E. W. McAllister, of Kansas City. A new shaft will be sunk and hoist put up.

Montauk—This property has been sold for the benefit of the creditors, having been bid in by Wm. Schaw, acting as referee. This was formerly the Zantgraf mine.

MERCED COUNTY

Yosemite Dredging and Mining Company—This company at Snelling, is now operating the dredge day and night with three shifts of men.

MOBAC COUNTY

Hoag District—In some of the claims they are now down 150 ft. and have good ore. A number of small tunnels have also been run. Two mills will be ready as soon as the snow disappears. There is considerable ore on the dumps ready for them to work.

NEVADA COUNTY

Black Bear—A mill, with concentrators, has been purchased, and is being put in place. Sinking is continued without interruption and the ledge is large and retains its values.

Golden Gate—For this mine, Grass Valley district, W. P. Martin, superintendent, a 10-stamp mill has been completed and is being put in place.

Poscy Cañon—The clean-up of this gravel mine is thought to prove conclusively that the main gravel channel has been cut.

PLACER COUNTY

Big Dipper—This old drift mine on the Iowa Hill divide, which was profitably worked for years by the Waterhouse Brothers, of San Francisco, has been purchased and reopened by a new company under Superintendent J. E. Rose. The

name of the company is McGeachin Gold Mining Company.

Dalhousie—At this mine, near Emigrant Gap, Superintendent C. J. Tripp is rebuilding the mill burned some time since, and has put a force of men at work.

PLUMAS COUNTY

Lone Star—L. V. Tefft is about to work the gravel by the steam-shovel system.

Sunnyside—Henry Merrill, who has a lease, is commencing a long tunnel to develop it.

SHASTA COUNTY

Brackett—A valuable discovery is reported in this mine, three miles west of Redding.

SIERRA COUNTY

Brush Creek and Ante-Up—These two mines, between Goodyear Bar and Mountain House, are being reopened by a Chicago company and machinery is being supplied.

Secret Cañon—W. H. Weldon is preparing to reopen this gravel mine, near Forest City.

SISKIYOU COUNTY

Northern California Dredge Company—The new suction dredge at Hamburg Bar has commenced operations. J. A. Brent is superintendent, and the company has taken up many miles of the bed of the Klamath river.

Scott Bar Hydraulic Mining Company—This company, near Hamburg, is constructing a 25-mile ditch, 13 miles of which have been completed. This will bring a large water supply to the gravel banks.

YUBA COUNTY

Northern Gold Mining Company—This company has been organized to operate properties at Brownsville, among them the Apple Tree mine, where rich ore has recently been found.

Colorado

GILPIN COUNTY

German Gold and Uranium—Shipments are being made of uranium ores from the German mine on Quartz hill, to New York buyers for German firms. In the 120 east level high-grade gold-copper ore has been opened as well as a body of milling ore. Robert Miller, Bald Mountain, Colo., is superintendent.

Incidental—Cincinnati and Denver men, interested in a lease and bond on this mine, in the Russell district, are installing machinery and erecting a new shaft building. W. L. Shull, Russell Gulch, Colo., is manager.

Van Dercn—Gano & Co., of Denver, have taken a lease and bond on this property in the Russell district and will arrange for new buildings and machinery. W. C. Le Prowse, Russell Gulch, Colo., is in charge.

Oro—Harris & Co., of Central City, have put new machinery and a shaft building on the property in Quartz Valley district and are shipping regularly principally to the stamp mills.

Sherman & Macon—It is stated that Missouri men interested in this property intend to erect a 50-ton mill. F. L. Branharn, Central City, Colo., is superintendent.

Senator Mines—Chicago men have become interested by purchase of the property near Black Hawk and are arranging for the active operation of their holdings.

Alps—Lessees on this mine in Nevada district have opened up some gold and copper ores, besides the free milling ores which are being shipped regularly.

Fifty Gold Mines—On account of increasing tonnage from company mines and heavier custom patronage in its mill, a Goodman 6-ton electric locomotive has been delivered for hauling ore to the mill. Some experimenting is being done with cyanide on the low-grade ores. Employment is being given to 125 men and the property is the heaviest shipper in the district. It is the intention of the management to electrify the machinery in the near future. M. D. Draper, Central City, Colo., is manager.

Gold Collar—Cincinnati capitalists interested in this group in Prosser gulch have authorized development of these claims. Alfred Skeels, Central City, Colo., is manager.

Tucker Mill—This mill in the Quartz valley district has been sold by the Lyons-Kyle Mining Company to W. H. Hearne, of Wheeling, W. Va., for the treatment of the Anchor ores. H. Irving Jones, Central City, Colo., is manager.

Alger-Kansas—Development of this property in Nevada gulch will be commenced. S. Harper, of Central City, will be in charge.

Aurora—Pittsburg capitalists have purchased this mine in the Russell district. Harry W. Kane, Central City, Colo., is manager.

Argo—Local operators leasing in this mine in Russell gulch have encountered high-grade ore carrying gold, silver and copper. H. C. Willis, of Central City, Colo., is manager and regular shipments will be made.

Denver Mining and Reduction—A lease for three years has been taken on the old

Fitz Porter rock building below Black Hawk and concentrating tables will be installed for the purpose of handling the slimes from North Clear creek.

Frontenac Mines Syndicate, Limited—The Penn and Iron City mills below Black Hawk are being remodeled for the purpose of treating the low-grade ores from this company's mines in the Russell district. F. C. Bowman, Central City, Colo., is superintendent.

LAKE COUNTY—LEADVILLE

Tenderfoot—The shaft on this claim in South Evans gulch is down 150 ft., and a crosscut from that point has encountered a body of ore 14 ft. thick. Shipments are now being made from three properties in this section, the Tenderfoot, the Cleveland and the Valley.

Virginus Group—These claims in the neighborhood of the Dinero tunnel in the Sugar Loaf district are to be worked by the Sugar Loaf Consolidated Mining Company.

Sunday—Connections have been made between the main shaft and the tunnel in the Bald Mountain district, and ventilation is now sufficient to permit the development of the orebody recently opened.

New Discovery—Lessees are sinking a shaft to a depth of 150 ft., 50 ft. of which are completed.

Dauntless—Work is to be resumed shortly on this and the Chance-Hilltop claims in the Horseshoe district. Zinc ore has been encountered in both claims.

Latchaw Tunnel—The recent clearing of the road has enabled this property in the Twin Lakes district to resume shipping.

SAN JUAN COUNTY

Silverton Mining Company—The old North Star mine on Sultan mountain has been under development for some time by this company and it is stated that sufficient ore is now blocked out to warrant operating the mill as soon as the latter can be overhauled.

Idaho

BONNER COUNTY

Idaho Smelting and Refining Company—Herbert Anderson, of Chicago and Winnipeg, president, went to Sand Point, Idaho, without waiting for a warrant to be served, and surrendered to the sheriff to face a charge of embezzling \$175,000 from the company.

Indiana

CLAY COUNTY

Miami Coal—This company is entering the Clinton field. Two new mines are being opened on its large coal-land holdings of that section. The company owns 1400 acres of coal land in this field.

BLACKFORD COUNTY

Petroleum operators in the oilfields of this section show a considerable gain over previous weeks. There is more activity near Montpelier than at any time since last mid-summer. There are few non-producing wells and a dry hole does not discourage operators or condemn a large space of ground.

There were eleven wells completed in the Indiana field during the week and all producers except one.

Missouri

JOPLIN DISTRICT

Chew & Baker—A strike of shallow lead was made near Duenweg at 12-ft. depth.

Continental—Operations were resumed in the Prosperity mine after a shutdown of nearly two months, due to a fall of rock on the pumps. Mules have been placed in the mine to cheapen the haul.

De Graff—This company has just completed the erection of a 150-ton mill on its lease on the Brooks land, west of Joplin.

Delta—This mine, at Spring City, has shut down on account of the long haul underground. A new shaft will probably be sunk.

J. P. N.—P. N. Wiggins, J. P. Newill and H. Putnam have sold this mine at Porto Rico to John Durby for \$20,000. He has bought the Egyptian mill and will move it at once.

Old Dominion—The Iroquois mill has been moved to the 80-acre tract in Gordon Hollow and is to be enlarged.

Quick Seven—At this mine, and in its neighborhood, near Neck City, there is a new camp which shows some good prospects.

Sunrise—The mill at Spring City was burned to the ground. The loss was covered by insurance. The company will rebuild. C. V. Miller, of Joplin, is manager.

ST. FRANCOIS COUNTY

The miners of the St. Joseph and Doe Run lead companies have struck for an advance of 15 per cent. in wages. None of the other mines are involved so far, but if the strikers succeed, the movement will undoubtedly spread through the district.

Michigan

COPPER

Isle Royal—Good progress is being made in sinking the new shaft on the Baltic lode. Some copper has appeared in the formation, but nothing of a commercial value.

Centennial—A much better state of mineralization is being revealed in the northern extension of the drifts from the

shaft, and particularly so at the seventeenth level drift, which is approaching the South Kearsarge lode. A gradual increase is being made in production and also in the copper contents of the rock.

New Baltic—This company has begun drilling. The results of this drilling will be awaited with much interest, as in the trenching work a very promising formation was revealed and the drill cores will show its contents at depth.

Allouez—The south drift from the fourteenth level of No. 2 shaft has again come into good copper rock, after passing through a small strip of barren ground. An improvement in the copper contents of the rock has been in evidence for the past two months.

Mohawk—This company has begun diamond drilling to test the overburden, preparatory to sinking its No. 6 shaft. This shaft will be put down about 2500 ft. south of No. 5, and will command the southern portion of the tract. The southern drifts from No. 5 shaft are in good ground and some are extended about 1300 feet.

Montana

BUTTE DISTRICT

Butte-Alex Scott Copper Company—Articles of incorporation of the company, a Delaware corporation, were recently filed in the county clerk's office. The capital stock is \$1,250,000 with shares of the par value of \$10 each. The directors are stated to be Walter P. Rainbow, Clarence A. Williams and Orville G. Flister, of Pittsburgh.

East Butte—It is stated that proxies for more than 125,000 shares of stock have been received to be voted in favor of the purchase of the Pittsmont company's property.

Butte & Superior—Arrangements have been made for the shipment of 2000 tons of zinc ore which is now on the dump to the experimental zinc concentrator at the Butte Reduction Works. On the 1200- and 1400-ft. levels development work is being carried on both east and west. On the 1200-ft. level the work has progressed a distance of about 300 ft., both east and west of the shaft. On the 1400-ft. level two veins have recently been cut, one 10 ft. in width and the other 14 feet.

Elm-Orlu—A new trestle and new ore bins have recently been completed for the handling of zinc ores.

Copper Eagle—Regular shipments are now being made from the mine; both first- and second-class ore being shipped. The ore carries chiefly silver and gold.

BROADWATER COUNTY

Ohio Group—An option for the sum of \$100,000 has recently been given on this group to G. M. Bourquin and John N. Kirk, of Butte. The property is situated in the Radersburg district, not far from

the Keating Gold Mining Company's property.

DEER LODGE COUNTY

Washoe Smelter—N. P. Pratt and W. P. Heath, Government chemists, are making an investigation of the smoke problem at the smelter with a view to ascertaining a method by which the fumes may be utilized for the manufacture of sulphuric acid and for other commercial purposes.

FERGUS COUNTY

North Mocasin—A cave in a winze has seriously interfered with the working of the mine within the past few weeks. The cave has been growing and has reached such dimensions that the richest part of the orebodies have been shut off from further working.

Barnes-King—It is reported that a recent strike of high-grade ore has been made in the property on the 200-ft. level, at a point not far from the mill.

JEFFERSON COUNTY

Daly Group—This consists of five patented claims at Wickes. It is stated that a deal is to be closed whereby an Eastern syndicate will secure control of this property. The claims are valuable, principally for silver and copper.

Brooklyn Bridge Mining and Milling Company—It is reported that operations will soon be resumed on this property, which is situated in Lump Gulch, about six miles from Clancy. The property consists of 15 claims, on one of which is a shaft 435 ft. in depth. The officers of the company are: J. Krueger, of Helena, president; W. C. Barden, of Helena, vice-president; W. E. Durfense, of Butte, secretary and treasurer.

Nevada

ESMERALDA COUNTY, GOLDFIELD

Yellow Tiger—Crosscutting of the vein on the 700-ft. level is now being carried on. The property is equipped with a steel gallow's frame and one of the largest hoists in the district.

Florence—An extra tube mill and several tables will be installed shortly, which will greatly increase the capacity of the plant.

Victor-Gold Bar—A 30-ton shipment was made last week, returns from which gave \$95 gold, a small amount of silver and 6 per cent. copper.

Albenmarle—It is reported that work will be resumed in the course of the next few weeks. The company's holdings consist of 11 claims two miles due east of Goldfield. It is equipped with a 25-h.p. hoist and the main shaft is 300 ft. deep.

ESMERALDA COUNTY—RAWHIDE

Mint Leasing Company—A rich vein of gold is reported on the 300-ft. level.

The shaft will be sunk to the 500-ft. level. Shipments of ore are made regularly.

Marigold—A vein 1 ft. wide and running high in gold is reported as being recently discovered.

Dromiac—The shaft is down 150 ft. A gallow's frame and a 15-h.p. hoist are being installed.

Rawhide Queen—Regular shipments of high-grade ore are being made to the Dayton & Hazen samplers.

Mint Extension—On the 220-ft. level a vein 4 ft. wide carrying \$15 in gold was encountered.

Dayton Toledo—Pay ore has been encountered on the 300-ft. level.

Royal Tiger—High-grade ore is reported on the 450-ft. level. The vein is only 2 in. thick.

Gratt Balloon Hill—Malcolm L. MacDonald has finished his examination of the mine and it is expected that his report will be ready in about 30 days.

Sweet & Weiss Mills—Five thousand dollars' worth of bullion is said to be missing from this mill.

Schneider—E. C. Klinker, of Rawhide, has purchased the controlling interest in this mine. Extensive work will be carried on and a mill has been purchased.

ESMERALDA COUNTY—SILVER PEAK

Pittsburg Silver Peak—The raise from the tunnel level of the Mary to the workings on the Drinkwater claim is nearly completed. The raise will be 1400 ft. long, on the incline, and will be double tracked the entire distance. The ore will be handled by two 4-ton skips.

HUMBOLDT COUNTY—MAZUMA

London Syndicate—The mill will be in operation within the next three or four days. The first ore to go through the plant will be from Wihuja lease. Teams are hauling ore from the mines to the mill. The cost of the mill, including the cyanide plant, is, approximately, \$80,000.

Seven Troughs Coalition—The Kindergarten vein has shown no sign of depreciating in value. The ground at the 300 level is improving.

Wihuja—Work is progressing on the Kindergarten and the Wihuja veins. Ore shipped to the Coalition mill averages \$65 per ton.

Harris Lease—The shaft on the Fairview claim is down 270 ft. A winze from the 200 level opened some high-grade and milling ore.

Jess-Bard and Sandifer Leases—These leases on the coalition have affected a consolidation. The Sandifer has a gasoline hoist and two pumps, and will keep the water out of both mines, and enable one or the other to explore the Harnan vein.

Potter-Arnett Lease—A 50-h.p. steam engine and a No. 7 Cameron pump have been installed. The shaft will be sunk to

the 300 level before any lateral work is done.

Reagan Lease—An extension of two years has been granted on the lease and the shaft will be sunk 200 ft. more, making a total depth of 500 feet.

Rambler—A 200-ft. shaft will be sunk on a 6-ft. vein, which has been opened up for 150 feet.

Big Thing—John G. Huntington has leased and optioned this property.

NYE COUNTY—PIONEER

Bullfrog Pioneer—Four feet of high-grade ore was disclosed last week in the raise from the 210-ft. level. A new 12-drill air compressor has been ordered, also an electric hoist, the latter to be installed on the 210-ft. level. Shipments for last week were approximately 500 tons.

Mayflower—A stockholder's meeting will be held in Rhyolite on May 15. Most of the ore is now being extracted from the 200- and 300-ft. levels, while development work is being pushed on the 400-ft. level.

Indiana-Nevada—This company operating three claims adjoining the Pioneer has a 15-h.p. hoist in place and is erecting a gallows frame preparatory to active development work. The shaft, now 65 ft. deep, will be sunk to the 150-ft. level at which point it is expected the vein will be cut. Four leases have been granted on the property, one block having been taken by Messrs. Taylor, Niven & Price.

NYE COUNTY—BULLFROG

Homestake—This property was closed down last week for an indefinite period, owing to insufficient ore to supply the mill. Nearly all the work underground was devoted to the extraction of ore and no attention given to the development of new orebodies.

National Bank—The Logland lease has another shipment of 20 tons ready for the smelter, which will run about \$65 per ton. In addition, a quantity of milling ore has been extracted that will be held until such time as it can be locally treated.

NYE COUNTY—TONOPAH

Montana Tonopah—The mill is again working at full capacity with a 90-per cent. extraction recorded for last week. An output of about 1200 tons per week is being maintained. The semi-monthly clean-up for April resulted in 21 bars of bullion weighing approximately 80 pounds each, and 100 tons of concentrates shipped to the smelter.

Tonopah Mining—The mill report for the week ending April 10 shows that 3040 tons of ore, valued at \$22.50 per ton, were crushed. Shipments consisted of 60 bars of bullion worth \$800 per bar and 20 tons of concentrates at \$525 per ton, making total shipments amount to \$67,500.

NYE COUNTY—ROUND MOUNTAIN

Fairview—Operations have been re-

sumed and an average of 20 tons is being treated daily in the mill. Development work is being pushed on the several levels and a steady output is expected.

NYE COUNTY—MANHATTAN

Manhattan is now the scene of much activity on account of its placer developments. The gulch from Manhattan to its junction with Smoky valley, five miles to the west is being prospected and worked by about forty different companies and leasers. Bed rock varies from 30 ft. at the east or upper end to 80 ft. at the lower end.

WHITE PINE COUNTY

Nevada Consolidated—According to James Phillips, Jr., president, the fourth unit of the Steptoe plant will cost \$162,000. The company now has over \$2,000,000 in cash, accounts receivable, and copper.

New Mexico

CHAVES COUNTY

It is reported that at a depth of 1120 ft. a flow of natural gas was struck. The well is three miles east of Dexter.

Oregon

BAKER COUNTY

Cougar—Theodore L. Lammers and other Spokane men have obtained a 15-months' lease, and the mine is bonded to them for \$250,000.

South Dakota

LAWRENCE COUNTY

Custer Peak District—The principal property is that of the Custer Peak Mining Company, with a shaft down over 200 ft. At that level crosscutting showed about 1 per cent. copper. Winzes sunk indicated a material increase with depth. The shaft is being sunk to 400 ft., where crosscutting will be resumed.

Imperial—This company has shut down some of its mines, and is operating the mill one shift. Notices are out of a special stockholders' meeting to increase the bonded indebtedness from \$300,000 to \$500,000 for the purpose of retiring outstanding bonds, paying off floating debt and erecting a modern reduction plant.

Golden Crest—A new electric pump has been installed at the 125-foot level, where work is to be prosecuted before unwatering the deeper workings.

Hercules—Mill construction is now well under way. The mill flow will be as follows: The ore will pass through a No. 5 Gates crusher at the mine, thence by cable tram 3000 ft., crossing Butcher gulch, to the mill. Here it will be fed from the bins to 40 stamps to pass 20 mesh, going to two Dorr classifiers. The slime overflow from the classifiers will go to a 10x30-ft. settler, the sand discharge passing through two 5x22-ft. tube

mills, Allis-Chalmers make. The tube-mill discharge passes to two hydraulic classifiers, the overflow from which is returned to the Dorr classifiers, the overflow going to two 30-ft. diameter settlers. The thick slime from the settlers will be pumped to two Brown tanks, 45 ft. high and 15 ft. in diameter, from which, after agitation, it will flow to a Butters filter plant. The solution from the filters and the overflow from the settlers will be pumped through filter presses to the precipitation room. The Butters installation at the Hercules will be the first in the Black Hills.

PENNINGTON COUNTY

Rochford District—Interest has been stimulated by the arrival of Robert Bunce, of London, who was in the Hills in 1907, to inspect the Standby and other properties on which he has an option. H. S. Denny, formerly of South Africa, now of Mexico City, is expected to arrive in a few days to make examinations.

Utah

BEAVER COUNTY

Indian Queen—The tunnel is in a distance of 2550 ft., and progress at the rate of 10 ft. per day is being made by two shifts. Arrangements for a complete ventilating equipment have been made. Upon its installation the progress will be increased by putting on a third shift.

Utah Gold and Copper—In the west tunnel the vein has widened to about six ft. A 250-ton concentrating plant is to be erected. The roads from the mine to the railroad are getting in condition to permit heavy shipping and the working force will be increased.

Moscow—A drift is being run on the 300-ft. level in a vein of lead-carbonate ore. Work is also being done on the 400-ft. level. The property is shipping about 2 cars per week. Twenty men are now employed.

Newhouse—The slimes-settling system of the mill is being doubled, and the other additional equipment includes 2 jigs, 16 Wilfley and to Johnston tables. Owing to a change in the character of the ore the saving in the mill had dropped from a normal of 70 per cent. to as low as 50 per cent. Samuel Newhouse, in a letter to a leading stockholder, is quoted as saying: "Personally, I am confident that when these changes are made we will increase our savings to such an extent as to enable us to meet the market conditions of copper, even though they remain bad for some time. Under Mr. Drummond's management we have introduced the caving system, which is resulting in lower mining costs, the physical condition of the mine warrants the assertion that there are many years' tonnage to be had for the mill at a very low cost under this caving system."

Beaver Carbonate—The new orebody on the 700-ft. level has been followed for 30 ft. The ore continues to be of a good milling grade. The drift will be continued and a crosscut has been started to determine the width of the shoot.

Cupric Copper Company—The steam-hoisting plant is now in commission. The shaft is now down 205 ft., but no cross-cutting will be done until a depth of 400 ft. has been reached.

SALT LAKE COUNTY

Yampa—Two converters, one blast furnace and three reverberatory furnaces are now running full blast, treating 23,000 tons of ore per month from the Yampa mine. About 350 men are now employed in the mine and smelter.

Tintic—The Tintic Company, which owns the Tintic Mining and Development Company and the Yampa Smelting Company, is to issue \$500,000 in convertible bonds in order to take care of indebtedness. In the readjustment made necessary by this bond issue, the company will have 900,000 shares of \$3 par value instead of 700,000 shares of \$5 each, as at present. The outstanding capital of \$3,500,000 will first be reduced to \$2,100,000 and then increased to \$2,700,000.

Boston Consolidated—Production in March was 1,253,926 lb., costing 10.5c. per lb. The output of the porphyry mines was 917,163 lb., costing 11.14c.

SEVIER COUNTY

Jumbo Plaster Company—The gypsum deposit in this region is of great extent and of a remarkably pure character. An 80-ton milling plant is in successful operation, and plans for increasing the capacity are being considered.

SUMMIT COUNTY

Wabash—This mine was flooded again despite the improved pumping facilities which were installed some months ago. A plan is being considered to make connections with the Ontario's original drain tunnel. Work will be suspended until an efficient drainage system can be devised.

Daly-West—The raise in the No. 2 Ontario drain tunnel is now up 100 ft. The total distance of the raise, when completed, will be 470 feet.

TOOELE COUNTY

Boston Sunshine—The mill is now in operation and has a capacity of 150 tons. The ore is of an oxidized character and runs from \$3.50 to \$10 per ton. Work is being done on the 200-, 400- and 600-ft. levels.

Washington

WHATCOM COUNTY

Washington Mining and Development Company—Plans are made to construct a \$200,000 water-power plant on

Collins creek in the Mt. Baker mining district.

SNOHOMISH COUNTY

Washington, Iowa and Edison Development Company—A new 15-in. vein was encountered recently at a depth of nearly 1100 ft. in the crosscut tunnel, the ore carrying galena and gold. The number of miners engaged will be increased in order to expedite the early completion of the tunnel.

West Virginia

FAYETTE COUNTY

Five Creek Collieries Company—This company, recently organized, has bought an old mine and 3500 acres of coal lands near Pembroke, and will increase the capacity of its mine from 600 to 1000 tons of coal per day. It is intended to install a new power plant, tippie and plane, construction work to be started immediately. Officers and directors of the company include P. M. Sharples, president; Isabel Darlington, secretary and treasurer; Thos. S. Butler and T. L. Eyre. The company's main offices are at West Chester, Penn., where the owners reside.

Wisconsin

PLATT COUNTY

Highland—Shipment of zinc carbonate to the Mineral Point Zinc Company is begun again after four months' stop. The Highland Mining Company is running carbonate through its 100-ton jack mill. The St. Anthony has resumed operation on its zinc deposit; by a recent decision of the State Supreme Court, this company also takes possession of the carbonate vein, located on its land, which has been mined by John Shifra without written lease for the last 30 years. The Wallace is running its winter's output of mill dirt through the plant of the Milwaukee Mineral Company; a raw concentrate assaying between 55 and 60 per cent. metallic zinc is produced.

Platteville—Some interesting information has developed regarding certain mining land now in litigation between the Wisconsin Zinc Company and the Enterprise Company. In tracing back title it is found that Major Roundtree, who obtained title direct from the Government, retained the mineral rights when he sold the surface land in the year 1855. The above companies both hold lease to the tract in dispute from the surface owners. The heirs of Mr. Roundtree now claim not only the right to the minerals mined, but the privilege to make such disposition of leases as they see fit. Ten concentrators are now in operation within a radius of four miles from Platteville, and a general revival of activity is promised. The new shaft sunk at the Mitchell Hollow shows good sheet jacks, and a mill will be constructed by the Wisconsin Zinc Company. This company is also developing the Kohinoor.

Canada

BRITISH COLUMBIA

During three months ended March 31, approximately 500,000 tons of ore were produced in the Boundary and Kootenay districts, in the following proportions: Boundary (copper-gold), 370,000 tons; Rossland (gold-copper), 60,000; Ainsworth and Slocan (silver-lead), 25,000; East Kootenay (lead-silver, 25,000; Nelson (chiefly gold-quartz), 20,000. By far the greater part of this ore was treated at Boundary and Trail smelting works, and of the remainder part was crushed in stamp mills and part reduced in concentrating mills, the concentrates going to Trail.

BRITISH COLUMBIA—ATLIN

Three large nuggets of placer gold found on Willow creek, have been taken to Seattle. The largest nugget weighing 32½ oz. and valued at about \$540, was lent to the Bureau of Mines so that the provincial mineralogist might have made a plaster cast for permanent exhibition in the mineral museum. The largest nugget known to have come from Atlin camp was found on a Spruce creek claim in 1899; its weight was 84 oz. and its value about \$1400.

BRITISH COLUMBIA—BOUNDARY

British Columbia Copper Company

The supply of coke for smelting is running short, owing to labor difficulties in the Crow's Nest section, from which fuel supplies are usually obtained. The Crow's Nest Pass Coal Company having granted the demands of the local district of the American Mine Workers, the Granby Company expects its supply of coke to be regularly maintained but other smelters have to depend upon collieries not now operating and which are resisting the coal miners' demands for closed shop and other concessions to which the operators are opposed. There is no present prospect of either side giving in.

Dominion Copper Company—The reorganization committee reports that there is deposited under the plan of reorganization over \$600,000 bonds out of the total issue of \$800,000. The Canadian court has ordered the sale of the properties to be held on May 28 at Vancouver rather than May 17, the day originally named.

BRITISH COLUMBIA—KAMLOOPS

Herman Beckman has 12 men developing the Kimberley. An orebody of good size and fair value has lately been encountered.

BRITISH COLUMBIA—QUEEN CHARLOTTE ISLANDS

On the Ikeda mine, on Moresby island, another shoot of copper ore has been encountered. Shipments of ore to the Tye Copper Company's smelter at Ladysmith, Vancouver island, are being continued. The mine is owned and operated by Awaya, Ikeda & Co., of Vancouver, B. C.

BRITISH COLUMBIA—SOUTHEAST KOOTENAY

Crow's Nest Pass Coal Company—J. D. Hurd, general manager, announced publicly at Fernie recently that the company had been obliged to withdraw from the Western Coal Operators' Association owing to efforts of that body to coerce his company into insisting upon points that did not concern either it nor its employees. His company had agreed with representatives of the miners on all important matters in the scale proposed to take the place of that in the agreement to expire on March 31, and only a few minor points remained to be adjusted. He was confident the proposed new agreement would be ratified by the men, and believed there would not be a cessation of work. Mr. Hurd stated further that the record made last July of 4000 tons daily will be exceeded. October will see a daily average of 6000 tons, and by the end of the year a further increase to 8000 tons daily will have been made. One thousand more coke ovens are to be built at Fernie.

NOVA SCOTIA

Dominion Iron and Steel Company—This company has received an order from the Great Northern railway, of Sheffield, England, for 5000 tons of 85-lb. steel rails. This is the first English order for rails received by them, and to fill it was necessary to make new rolls, the specification calling for bull-head rails, of a type not used in Canada.

ONTARIO—COBALT DISTRICT

Ore Shipments—Shipments of ore from Cobalt camp for the week ending April 26 were: Crown Reserve, 121,843 lb.; Kerr Lake, 60,000; La Rose, 261,300; Nipissing, 321,272; O'Brien, 128,598; Right-of-Way, 128,102; Temiskaming, 60,000; total, 1,081,115 pounds.

Cobalt Central—At the Big Pete mine the vein in the west drift on the 260-ft. level has widened. Five narrow veins are drawing together making 9 in. of high-grade and 18 in. of good milling ore.

Consolidated Cobalt—F. B. Chapin, president, has received confirmation of a report that a strike had been made on the Green-Mechan property. The vein was found in drifting at the 100-ft. level.

Hargrave—The main shaft is now down 215 ft. When it is 92 ft. deeper a level will be run into the Kerr Lake boundary to tap the vein in the sixth level of the Kerr Lake which is supposed to extend into the Hargrave.

La Rose—Active work has been begun on the Lawson property recently acquired. The old Silver Leaf shaft, which is down over 100 ft. and was sunk on the Lawson owing to an error in the survey, has been pumped out and drifting will be begun.

Michigan Development Company—This company is now operating the property

formerly known as the Coleman Cobalt, on which it secured an option from the Amalgamated. A shaft has been put down 60 ft., and 12 men are employed with S. D. Madden as manager. The company has also leased the Silver Bird property.

Paymaster—The Amalgamated property together with a leasehold on Saseganaga lake has been acquired by the Paymaster company. A crosscut has been driven 150 ft. northward from the main shaft at a depth of 100 ft. to a vein about 5 in. wide carrying low silver contents. The work is in charge of Superintendent Gordon.

Silver Queen—The annual meeting was held in Toronto, April 28. The financial statement showed liabilities outside the capital stock (1,500,000) amounting to \$14,223. The value of ore on hand and in transit—including \$25,000 estimated value of ore on dump—with cash balance amounted to \$40,633. At the end of the previous financial year the cash on hand was \$54,861. With this balance and what the mine produced the company paid \$195,000 in dividends besides spending a considerable sum in development and installing a new plant. The 12-drill compressor is producing more air than required, the excess realizing \$1000 per month. The Northern Customs concentrator began treating ore from the dump on May 5. Diamond-drill prospecting will shortly be undertaken.

Temiskaming—A steel shaft house open on the sides, of a type not hitherto seen in Cobalt, is being constructed. It rests on solid concrete masonry and is over 70 ft. high. The new shaft, which is a three-compartment one, is down 350 ft., and when complete will be connected with the present workings by crosscutting.

ONTARIO—GOWGANDA DISTRICT

Bonsall—At this location north of Miller lake, an 8-in. quartz vein was recently encountered, carrying high-grade ore studded with free silver.

YUKON

The official records of the gold commissioner for the Yukon show that in the fiscal year ended March 30 last, 288 quartz claims were staked, and that 40 of these were located and recorded in March. The first quartz claim was located by Isabella M. Healy on the Fortymile river in 1894, and since that time 1000 quartz claims have been staked in the Dawson division.

Klondike Dome Mining Company—Work is being pushed on the crosscut tunnel to catch the ledge at a depth of 1800 or 900 ft., when, if the values have not deteriorated, this section will boast a real quartz mine.

Sixtymile—Madison & Bouthlier in this new camp are in good pay dirt. Their work has stimulated considerable prospecting by others. In the Madison ground bedrock is 40 ft. deep, and owing to in-

sufficient water during the season most of the work is prosecuted during the winter.

Mexico

CHIHUAHUA

Bullion Shipments—The Chihuahua banks report the following receipts of bullion for the week ending April 24: Batopilas, 112 bars silver, 112,000 pesos; Watterson Gold Mining Company, 10 bars gold-silver, 20,000 pesos, and miscellaneous, entirely from Sierra Madre districts in western part of State, 8 bars silver, about 5000 pesos; total value, 137,000 pesos.

Republica—At a recent meeting of the directors it was decided to pay dividends beginning in May at the rate of 1 per cent. per month. The majority of the stockholders reside in El Paso and Kansas City.

Middle Mountain—This Naica company is opening up large bodies of milling grade lead-silver ores. D. M. Evans is general manager and A. C. Saunders is superintendent in charge.

American Smelting and Refining Company—An aerial tramway will be built from the Santo Domingo mine in the Santa Eulalia camp to the town of Santa Eulalia, from which latter terminal delivery of ore will be made directly to the Mineral railroad. A similar tramway has lately been completed from the Mina Vieja to Santa Eulalia, a distance of over two miles.

Parral Output—The production of the Parral camp for the week ending April 23 was 5040 tons of milling ore and 3905 tons of smelting ore, a total of 9035 tons.

Hidalgo—This large milling plant in the Parral camp was completely destroyed by fire on April 22. The loss is placed at about \$125,000, partly covered by insurance. The plant had been idle for some time.

GUANAJUATO

Guanajuato-Jalisco Development Company—This new company will operate a number of mines in the Guanajuato district, which have been under the control of Dwight Furness. The company is organized under the laws of New York, with a capital of \$1,000,000 preferred, and \$3,000,000 common stock. Dwight Furness is general manager. James C. Hinchcliffe, Paterson, N. J., is president.

SONORA

Promontorio—The Clark Copper Company, of Los Angeles, Cal., has secured this old mine, and is opening it under the management of Percy E. Barbour. The mine is full of water to the tunnel level, and preparations are being made to unwater it. Ore is being extracted from the workings above the tunnel level. A producer-gas plant, stamp and concentration mill are being installed.

Current Prices, Market Conditions and Commercial Statistics of the Metals, Minerals and Mining Stocks

QUOTATIONS FROM IMPORTANT CENTERS

Coal Trade Review

New York, May 5—Coal trade in the West is improving steadily, but still rather slowly. The making of contracts is less in evidence than it has been for several years, but recently this kind of business has taken on a sudden increase. It looks as if large consumers had made up their minds that it was possible that the open market might be an advancing one in the second half of the year and that contract business might be safer. In the Indiana district and in the adjoining districts of Illinois there is much interest in the plans being made for extensive operations of mines to supply the large demand for fuel for the Gary plant of the Steel Corporation.

In the East the bituminous trade also shows a slight improvement, but it is not yet marked. The principal topic of discussion is the probable designs of the West Virginia operators to secure a larger share of the bituminous trade in Eastern territory. Developments are being watched very closely.

The anthracite trade has been quieted by the announcement of the settlement of the dispute between operators and miners. The new contract which has been signed by the representatives of both parties is practically an extension of three years for the present agreement, with some minor concessions intended to remove small grievances complained of by the miners. The new agreement is given on another page.

A general subject of discussion is the decision of the United States Supreme Court on the commodities clause of the Interstate railroad law. This decision reverses that of the Circuit Court insofar as it holds the Hepburn act to be constitutional, but it limits radically the application of the law. A summary of the decision and some comments will be found elsewhere in this issue.

COAL TRAFFIC NOTES

Tonnage originating on Pennsylvania railroad lines east of Pittsburgh and Erie, year to April 24, short tons:

	1908.	1903.	Changes.
Anthracite	1,671,842	1,638,367	D. 33,475
Bituminous	10,335,276	11,053,264	I. 717,988
Coke	2,207,905	3,121,117	I. 913,212
Total	14,215,023	15,812,748	I. 1,597,725

Total increase for the year to date was 11.2 per cent. Increase for the week was 242,001 tons.

Shipments of coal over the Huntingdon & Broad Top road for the year to April 30 were 335,448 tons in 1908, and 284,321 in 1909; a decrease of 51,127 tons.

Shipments of coal originating on the Southern railway for the two months ended Feb. 28 were: Tennessee district, 226,157; Alabama district, 383,956; total, 510,113 short tons, an increase of 119,757 tons over last year.

The Pittsburg Coal Company reports shipments for the three months ended March 31 as follows:

	1908.	1909.	Changes.
Pittsburg district..	2,701,873	2,130,389	D. 571,484
Hocking district..	205,699	160,084	D. 45,615
Total coal.....	2,910,472	2,290,473	D. 619,999
Coke.....	2,648	96,016	I. 93,328

The decrease in coal shipments this year was 21.3 per cent.

New York

ANTHRACITE

May 5—The settlement of the anthracite agreement has relieved a certain degree of apprehension, though it cannot be said that the trade has shown much difference. The demand for domestic coal is still showing the effect of the summer discounts. In steam sizes supply is still a little behind demand, but it is expected that with the prospect of interruption in work removed, the companies will be inclined to ship small sizes from the mines more freely.

Prices on domestic sizes are \$4.35 for lump and \$4.60 for egg, stove and chestnut, f.o.b. New York harbor. For steam sizes current quotations are \$3.10@3.25 for pea, \$2.35@2.50 for buckwheat, \$1.70@2 for rice, \$1.25@1.50 for barley, f.o.b. New York harbor. Individual and washery pea can be had for 5 or 10c. less.

BITUMINOUS

The bituminous trade is still disturbed by West Virginia coals—or rather by the discussion of what the West Virginia operators may or may not do. Pocahontas and New River are still offered at low prices, delivered at tidewater. The question most in debate is whether the offers of coal delivered at Eastern ports will be continued.

Current trade is better, especially along the Sound, and it looks as if the far East was beginning to wake up, although its business so far is rather inquiry than actual buying. New York harbor is still dependent on cheap lots, but these are not

particularly plentiful. All-rail trade continues fair and improving. Car supply is good and transportation is slightly improved.

In the Coastwise trade boats are gradually becoming more plentiful, but rates remain steady, and smaller vessels in New York are not so confident about asking advances as they were a week ago.

Birmingham

May 3—The coal situation in Alabama shows little improvement, but the operators are more hopeful as the pig-iron market improves. There is no trouble in the way of getting all the help that could be desired at the coal mines.

Coke is in steady demand though not as active as it was for a while last year. There is much coke accumulated throughout the Birmingham district.

Chicago

May 3—Quiet but steady conditions exist in the coal market, the usual spring demand being apparent—for fine coals in preference to lump sizes and a lessened buying of domestic coals. Demurrage evils hold off from the market, only a few grades of Illinois coal, Hocking Valley and an occasional consignment of Eastern coal being sold subject to discount because of delay at the railroad terminal. The steam market is undoubtedly improving—perhaps faster than some dealers will admit, but competition is keen. Prices, therefore, are low and seem destined to continue low, on both Western and Eastern coals. Contract business is quiet, the disposition of consumers being to hold off, and on such contracts as are being made prices are low.

Illinois and Indiana lump and egg sell for \$1.75@2.25; run-of-mine for \$1.65@1.75, and screenings for \$1.40@1.70. Screenings have advanced slightly as a result of the increased demand and conditions of production. Eastern coals in general are selling well, smokeless showing slight tendencies to get back to its old condition of large supply, especially on lump which, from Pocahontas and New River mines brings \$3.20, with run-of-mine smokeless at \$2.95@3.15. Hocking Valley has been troubled with overshipments, selling for \$2.90@3.15, the latter being circular price, but with a good demand.

The anthracite market is dull again, the April rush being over and buying being chiefly in small lots for temporary use.

Cleveland

May 4—Shipments of Lake coal have hardly begun. The late ice at the Sault has kept vessels from starting out, and few cargoes are yet loaded. The unions are trying hard to keep men off the boats, but without much success.

Steam coal is improving in demand, but there is less call for slack than there was. Prices for fair grades of steam are quoted the same as last week, about \$1.35 for lump, \$1.10 for run-of-mine and 60¢@75¢ for slack, all at mines.

Indianapolis

May 4—Shipments from mines are improving. Chicago dealers claim that there is too much Indiana coal going forward, but operators say that their orders and contracts warrant better working of mines. The topic of discussion just now is the extension of operations by the Brazil Block Coal Company in connection with the Steel Corporation.

Pittsburg

May 4—The Pittsburg Terminal Railroad and Coal Company has scheduled seven of its mines to start within a few days. The Lake shipping season is now well commenced, although a large vessel capacity is not yet at command as ore shipments have not become heavy. Prices continue low and unsatisfactory, some large contracts being made at around \$1 per ton for mine-run at the mine. The effort to maintain \$1.15 on ordinary business has not been successful, and ordinary lots continue to go at around \$1.10. Slack remains at '55 to 65¢. A mild freshet in the river reached its height May 2 and some empties are now being brought up as the stage recedes, and shipments should commence in a few days.

Connellsville Coke—Prices continue unsatisfactory and irregular, good grades of furnace coke selling down as low as \$1.40 in some cases for prompt shipment, although many operators hold their coke at \$1.50 or higher. Consumers are showing little interest in second-half contracts, on which \$1.75 is asked. Foundry coke for spot shipment is selling as low as \$1.75, contract coke being held at \$2@2.25.

The *Courier* gives the production in the Connellsville and lower Connellsville fields at 230,229 tons, a decrease of 3000 tons from the previous week. The shipments were 8985 cars, a decrease of 142 cars, and were distributed as follows: to Pittsburg district, 3323 cars; to points west of Pittsburg, 4739 cars; to points east of Connellsville, 923 cars.

Foreign Coal Trade

United States Coal Exports—Exports of coal and coke from the United States, with coal supplied to steamships in foreign

trade, three months ended March 31, long tons:

	1908.	1909.	Changes.
Anthracite.....	422,865	428,974	1. 6,109
Bituminous.....	1,845,022	1,616,160	D. 328,862
Total exports.....	2,267,887	1,945,134	D. 322,753
Bunker coal.....	1,461,651	1,386,502	D. 74,749
Total.....	3,729,538	3,332,636	D. 397,502
Coke.....	209,202	246,791	1. 37,589

Canada took this year 1,333,255 tons of coal, or 68.5 per cent. of the total. The coke went chiefly to Mexico and Canada.

United States Coal Imports—Imports of coal and coke into the United States, three months ended March 31, long tons:

	1908.	1909.	Changes.
Anthracite.....	15,023	3,115	D. 11,908
Bituminous.....	485,168	308,354	D. 176,814
Total coal.....	500,191	311,469	D. 188,722
Coke.....	39,545	54,573	1. 15,028

Canada furnished this year 257,436 tons of coal and nearly all the coke; Australia, 38,735 tons of coal. Imports are chiefly on the Pacific coast and on the northern border, into Montana and Washington.

Welsh Coal Prices—Messrs. Hull, Blyth & Co., London and Cardiff, report current prices of coal as follows, on April 22: Best Welsh steam, \$3.72; seconds, \$3.60; thirds, \$3.42; dry coals, \$3.48; best Monmouthshire, \$3.30; seconds, \$3.18; best small steam, \$2.64; seconds, \$2.28.

Iron Trade Review

New York, May 5—The iron and steel markets generally show a considerable increase in activity. Moreover, the general sentiment is improving and consumers seem to be acquiring more confidence in the future. At any rate they are making contracts for longer periods ahead.

In pig iron inquiries are numerous and sales are larger, running well over into third-quarter deliveries. This is especially the case in Eastern and New England territory where the foundries are buying in larger lots than for some time past. Prices are accordingly firmer for foundry iron, and furnaces are not making concessions such as were offered to buyers a short time ago. The general level of prices has not increased, but it is much better maintained. Southern furnaces are sold up to their current production for the next two or three months and are talking of advancing prices 50¢ per ton. There has also been considerable buying of basic iron.

In finished material a good business continues to be done in structural steel. Building projects seem to be increasing in number and bids are being asked for some large work. Smaller contracts have made up a good aggregate business. A good business is also reported in plates and bars.

The American Steel and Wire Company has, at last, made the promised reduction in wire and wire products, for which the

trade has been waiting. This reduction varies from \$7 to \$10 per ton, and affects many articles of general use. Thus nails have been reduced from \$1.95 to \$1.60, Pittsburg basing price. It is expected that these reductions will stimulate business, which had already shown a tendency to increase, but was held back by the high prices maintained on wire.

There are reports that negotiations are quietly in progress over the price of rails. It is said that offers have been made to some of the larger railroad companies of a substantial cut, provided they will place large orders. The truth of these rumors cannot be ascertained, but they have at least an appearance of probability.

Southern Basing Points—It is stated that hereafter Birmingham, Ala., is to be made a basing point for steel prices. That is, prices for steel products will be made at Birmingham, and will not be the Pittsburg price, with the differences in freight added.

Baltimore

May 4—Exports for the week included 40,000 lb. rutile concentrates to Hamburg; 36,560 lb. scrap tin to Antwerp; 145,280 lb. zinc dross and 6,677,300 lb. steel billets to Liverpool; 1709 tons steel rails and 290 tons fishplates to Buenos Aires. Imports included 200 tons ferromanganese and 1003 tons manganese ore from Rotterdam; 5800 tons iron ore from Cuba.

Birmingham

May 3—The new month has started in with many of the furnace company officials in the Southern territory in an encouraged frame of mind. The sales during the past month aggregated considerably more than the make, with the greater number of the manufacturers, and the negotiations under consideration will require much more iron. The prices have stiffened during the past fortnight and \$11.50 per ton, No. 2 foundry, is the minimum, with \$12 being asked in some quarters. There is considerable talk now heard in this district in regard to an increase in the output and five furnaces are reported either ready or nearly so. Some good sales are reported made during the last two weeks, one company selling 10,000 in one lot. The shipments of pig iron from the South have been slack lately. There is a little accumulated iron here, but as soon as some of the companies now holding out of the market begin selling again this will be worked off.

Operations at the steel plant of the Tennessee company at Ensley are still on.

The sale of the properties of the Southern Steel Company in bankruptcy has been practically confirmed; an appeal has been taken and the litigation is still on, but steps are now under way looking to the reorganization.

Chicago

May 3—Quiet but firm conditions exist in the iron market, the users of pig iron having apparently determined to wait a while longer before contracting for the last quarter, in which the trading centers. For third-quarter needs, however, there is still much iron to be supplied. Purchases for current needs are increasing and there undoubtedly is a better tone to the market. Efforts to keep Southern firm at \$11.50 Birmingham or \$15.85 for No. 2 Chicago have apparently been successful and sales range 50c. above and below this price according to the need and special conditions, this basic quotation being for third quarter. Northern iron remains firm, buying being light and production well restricted. The standard quotation on Northern remains \$16.50 for No. 2, above and below which there is a range of 25 or 50c. Brisk buying for the previous week or two seems to have had something to do with the falling off in the demand for Southern iron with some of the large consumers.

In finished iron and steel the market is certainly improving, though railroad supplies are not yet in so good relative demand as other lines, and structural steel is quiet, for the present. Here, as in the pig-iron market, confidence is gaining daily. Coke is still at \$4.70 for the best Connellsville, though the demand is good.

Philadelphia

May 5—More buying, both of foundry and basic iron, is in evidence. Consumers are inclined to buy further ahead than for some time past. Sellers are stiffer as to prices; no advance has been asked, but there is less disposition to make concessions. No. 2X foundry can be had at \$16@16.50; No. 2 plain, \$15.50@16. For deliveries running into third quarter furnaces want 25 or 50c. more. Stocks at furnaces are being reduced in quantity.

Steel Billets—Little business at current prices. Any large orders could be placed at a reduction.

Bars—Demand is rather irregular, chiefly in small lots. Steel bars sell better on the lower price. Store trade is improving.

Plates—New sales are moderate, but specifications on contracts are increasing. Late in the week some large orders came in.

Sheets—Buying is only fair, and mills are willing to shade prices on good orders.

Structural Material—One or two large contracts have been placed and others are under negotiation. Small orders are coming in well.

Scrap—No heavy sales reported, but there are some good inquiries, especially for railroad and machinery cast. Dealers are beginning to sit up and take notice.

Pittsburg

May 4—The event of the week has been the reduction in wire prices by the American Steel and Wire Company, making a new market to which all interests will adhere. From previous official prices the reductions are: Wire nails, \$1.95 to \$1.60 per keg, base, or \$7 per net ton; plain wire, 1.80c. to 1.60c. per pound, base, or \$8 per net ton; barb wire, painted, 2.10c. to 1.60c.; galvanized, 2.40c. to 1.90c., or \$10 per net ton. Per gross ton these reductions average about \$9. The announcement was made in a circular dated May 1, received by the trade May 3, and the new prices are effective May 1. Orders on books will be voluntarily adjusted to the new prices, and shipments in transit on May 1 will probably also be adjusted. There had been shading of 10 to 15c. per keg in nails, the official reduction now made being two or three times as much, and there had been considerable cutting in plain wire, although not much in barb wire.

The wire reduction is merely a part of the general readjustment in steel prices determined upon Feb. 18 last. Originally it was expected the reduction in wire would be made March 1, but as the trade was in the midst of the busy spring season an effort was made to hold prices until the heavy business was put through and the material distributed, and this effort has been fairly successful. The trade is now entering upon a season which is usually dull.

All finished-steel products except standard rails have now been reduced since the open market was declared on Feb. 18, the total reductions ranging from about \$5 per net ton on merchant-steel bars, sheets and tinplates up to \$10 on some sizes of steel pipe and on barb wire.

Pig Iron—Inquiry for pig iron is somewhat less active than a week ago. Locally the chief activity has been in the purchases of the Standard Sanitary Manufacturing Company, which has just bought 2100 tons of gray forge for May and June delivery, the price being a shade under \$13.50. Valley. This company is just closing for 500 to 1000 tons of No. 2 foundry, at \$14, Valley. Local furnaces are stiffer in their ideas of price, a number having withdrawn quotations in the past few days, or advanced them 25c. per ton, and asking a minimum of \$14.25, Valley, on No. 2 foundry or basic, even for early delivery. There is still some iron to be had at old prices, and we continue to quote, for May and June delivery, \$14, Valley, on No. 2 foundry, basic and malleable, \$13.50 on gray forge and \$14.75 on bessemer. For third quarter, 25c. higher all around is asked.

Steel—The market remains firm, but quiet, consumers being covered by term contracts, on which shipments are of increased volume. Billets are \$23, Pitts-

burg, and sheet-bars \$25.50, delivered Pittsburg, Wheeling, Youngstown, etc.

Sheets—Demand fairly good; prices remain 2.25c. for black and 3.25c. for galvanized, 28 gage, for ordinary carload lots, these prices being sometimes shaded \$1 per ton on attractive orders.

Ferromanganese—The market is irregular, the minimum being about \$41, seaboard, on large lots for early delivery and \$42 on carloads, the freight to Pittsburg being \$1.75. All ferromanganese contracts are being made with a clause protecting the seller in case the duty is advanced.

Foreign Iron

British Iron Production—The British Iron Trade Association reports that the production of pig iron in Great Britain in 1908 was 9,289,840 long tons; being 634,016 tons less than in 1907, and 859,548 tons less than in 1906. The production in the first half of the year was 4,635,851 and in the second half 4,653,989 tons, an increase of 18,138 tons. The average number of furnaces in blast was 309; the average make per furnace, 29,970 tons.

Metal Markets

New York, May 5—In several directions the metal markets show some improvement, but business remains rather quiet.

Gold, Silver and Platinum

UNITED STATES GOLD AND SILVER MOVEMENT

Metal.	Exports.	Imports.	Excess.
Gold:			
Mar. 1909..	\$21,252,462	\$ 5,161,648	Exp. \$16,090,814
" 1908..	1,447,206	3,649,407	Imp. 2,202,201
Year 1909..	37,978,632	12,158,275	Exp. 25,820,357
" 1908..	3,859,003	17,296,044	Imp. 13,437,041
Silver:			
Mar. 1909..	6,079,287	3,279,531	Exp. 1,799,756
" 1908..	4,529,369	3,757,027	" 672,342
Year 1909..	14,473,950	10,463,218	" 4,010,732
" 1908..	12,586,287	10,830,656	" 1,755,631

Exports from the port of New York, week ended May 1: Gold, \$2,578,100, chiefly to Paris and Brazil; silver, \$1,064,420, mostly to London. Imports: Gold, \$210,370; silver, \$226,952, both from the West Indies, Mexico and South America.

Gold—There has been quite a demand for gold this week and prices in the open market in London have advanced 36d., 77s. 9 5/8d. per oz. having been paid for bars, and 76s. 4 1/4d. per oz. for American eagles. The Bank of France is again in the market, having taken all the Transvaal gold arriving during the week. In New York the demand for gold for export continues, \$500,000 having been taken for Brazil and \$1,500,000 for Paris. There is a prospect that the outward movement will continue.

Platinum—Business does not show much change, being still quiet, though electrical

sales are showing a little improvement. Dealers continue to quote \$23@24 per oz. for refined platinum, \$26 for hard metal and \$19@21 for scrap.

Silver—Under the impulse of speculative Indian and Chinese buying, silver has had a sharp rise, and closes with good orders at 247½d. in London.

SILVER AND STERLING EXCHANGE

Apr.-May.	29	30	1	3	4	5

Imports for the week £2500 from Mexico, £4000 from the West Indies, £175,000 from New York; total, £181,500; exports £228,500 to India.

Copper, Tin, Lead and Zinc

Apr.-May.	Copper.		Tin.	Lead.		Zinc.
	Lake, Cts. per lb.	Electrolytic, Cts. per lb.		New York, Cts. per lb.	St. Louis, Cts. per lb.	
29	12½ @12½	12½ @12½	57½	29½ @4.20	4.10 @4.87	4.87 @4.92
30	12½ @12½	12½ @12½	57½	29½ @4.20	4.10 @4.87	4.87 @4.92
1	12½ @12½	12½ @12½	57½	29½ @4.20	4.10 @4.87	4.87 @4.92
3	12½ @12½	12½ @12½	57½	29½ @4.20	4.10 @4.87	4.87 @4.92
4	12½ @12½	12½ @12½	57½	29½ @4.20	4.10 @4.87	4.87 @4.92
5	12½ @12½	12½ @12½	57½	29½ @4.20	4.10 @4.87	4.87 @4.92

London quotations are per long ton (2240 lb.) standard copper. The New York quotations for electrolytic copper are for cakes, ingots and wirebars, and represent the bulk of the transactions made with consumers, basis, New York, cash. The price of cathodes is usually 0.125c. below that of electrolytic. The quotations for lead represent wholesale transactions in the open market. The quotations on spelter are for ordinary Western brands; special brands command a premium.

Copper—During the week April 29-May 5, business broadened materially and fairly large transactions were consummated both with domestic and foreign buyers. Overtures were made for deliveries extending into the fall, but sellers were unwilling to contract so far ahead, although sales have been made for August delivery. Electrolytic copper has continued to be freely supplied at 12½c., delivered, 30 days, or a little less than 12½c., cash, New York, but some interests which heretofore have been rather

aggressive and inclined to make concessions have receded from that position. However, many are still disposed to shade prices for prompt and near-by delivery and such business has continued to be done at concessions. The supply of Lake copper being less extensive than electrolytic, the price for that grade has advanced to the full basis of 13c., sales having been made at 12½@13½ cents.

There is an impressive expansion in the requirements of manufacturers the world over and consumption appears to be rapidly reaching the point where it will take care of the output at the present rate. It is well to bear in mind that what has always been considered the normal increase in the consumption of copper has to be provided to a large extent by this country, expected supplies from Africa and elsewhere being still far in the future. There is still a great deal of room for improvement in the business of the large manufacturers, but the outlook for the gradual absorption of the surplus is now more encouraging than it has been for some time.

Meanwhile the demand is freely met at 12½@13½c. for Lake copper, and 12½@12½c. for electrolytic, in ingots, cakes and wirebars. The average of the week for casting is 12½@12½ cents.

Copper sheets are 16½c. base for large lots. Full extras are charged, and higher prices—up to 18c.—for smaller quantities. Copper wire, 14½c. base, carload lots at mill. Business has been more active.

The London standard market has been firm throughout the week, showing a very strong undertone and a tendency to respond to speculative buying in spite of the large available supply. The close is steady at £57 17s. 6d. for spot, £58 12s. 6d. for three months.

Refined and manufactured sorts we quote: English tough, £62; best selected, £61@62; strong sheets, £73@75.

After some large sales at the very beginning of April the market became more quiet, the price for electrolytic settling at 12½@12½c., which continued without change throughout the month. All of the agencies offered the metal at 12½c., delivered, 30 days, equivalent to a little less than 12½c., cash, New York, and this price was shaded to consummate transactions. Lake copper was freely sold at 12½c. for good ordinary brands, while some special brands fetched 13c., the quotation of 12½@13c. remaining unchanged throughout the month. Good business in both Lake and electrolytic was done right along, but nothing of spectacular proportions. A feature of the market in the latter part of April was the willingness of the agencies to sell electrolytic for delivery as late as August.

Tin—Toward the latter part of last week and the beginning of this week the London market showed a declining tendency, but notwithstanding the fact that transactions were of good-sized volume, quotations did not show a change to any

considerable extent. At the close the market has become a good deal firmer and is cabled at £131 for spot, £132 2s. 6d. for three months.

There is no change to be reported in the domestic market where business still leaves a great deal to be desired. Tin is quoted here at 29 cents.

Lead—Transactions have dwindled down to a retail volume, and prices have eased off to the level at which the leading sellers stand ready to supply the demand, quotations at New York being 4.20, and St. Louis 4.10 cents.

The John Wahl Commission Company reports to us from St. Louis, under date of May 5, that lead is dull, but prices remain steady. Ordinary Missouri brands are lightly salable at 4.10c., while 4.12½@4.15c. is asked for corroding lead.

The London market has also given way somewhat and closes at £13 2s. 6d. for Spanish lead, £13 5s. for English lead.

Spelter—The market has found its level, and there is a fair-sized business from day to day at last quotations, 4.87½@4.92½c., St. Louis, 5.02½@5.07½c., New York.

New York quotations for spelter, April 29-May 5, inclusive, were 5.02½@5.07½ cents.

The John Wahl Commission Company reports to us from St. Louis, under date of May 5, that spelter is firm, but very quiet. The latest sales are on a basis of 4.90c. for prompt and 4.92½c. for late May delivery.

Base price of sheet zinc is now 6¼c. per lb., f.o.b. La Salle-Peru, Ill., less 8 per cent. discount.

Reports from London are more encouraging, and prices have advanced at the close to £21 17s. 6d. for good ordinaries, £22 2s. 6d. for specials.

Other Metals

Antimony—There has been more buying, chiefly on account of the expectation that a duty will be levied on the metal. Quotations are 8½@8½c. for Cookson's; 8½c. for Hallett's; 7½@8c. for U. S. and other brands.

Aluminum—No. 1 ingots are 25@24c., base price; wire, 31@32c., and sheets 33@34c. base. No change in business.

Quicksilver—The New York quotation is \$44.50 per flask of 75 lb. Sales are improving. San Francisco sales light and prices nominal at \$44 for domestic and \$42 for export orders. London, £8 7s. 6d. per flask, with £8 3s. od. named by jobbers.

Imports and Exports of Metals

Exports and imports of metals in the United States, three months ended March 31, are reported as follows, in the measures usual in the trade:

Metals:	Exports.	Imports.	Excess.
Copper, long tons	69,982	34,151	Exp. 35,831
Copper, 1908....	81,364	20,241	Exp. 61,123

NOTE—Under zinc ore the first two columns give base prices for 60 per cent. zinc ore; the second two the average for all ores sold. Lead ore prices are the average for all ores sold.

phide ore, the base price ranging from \$38 to \$41 per ton of 60 per cent. zinc. The highest price of silicate was \$22, on a base of \$18 per ton of 40 per cent. zinc. The average price, all grades, was \$38.66, small sales of silicate advancing the average. The highest settling price of the week was \$58 per ton for lead ore purchased last week, the highest buying price of this week being \$55. The average settling price, all grades, was \$56.20 per ton.

Platteville, Wis., May 1—The highest price paid this week for zinc ore was \$43 per ton; the base price was \$39.50@40.50 per ton of 60 per cent. zinc. No sales of lead ore are reported.

SHIPMENTS, WEEK ENDED MAY 1.

Camps.	Zinc ore, lb.	Lead ore, lb.	Sulphur ore, lb.

In addition to the above there was shipped to the American Zinc Ore Separating Company 159,800 lb. and to the Joplin Separator Works 161,400 lb. zinc concentrates.

Cement Prices

May 5—It is stated today that, because of the action of certain large interests in cutting prices, a supplementary agreement has been promulgated by the cement manufacturers of the East who are in the so-called cement trust, which calls for a reduction of 15c. per barrel, excepting in New York City, where the reduction is 20c. per barrel. In addition the market in the States of Maryland, Delaware, Virginia and the District of Columbia heretofore covered by schedule A in the agreement is thrown wide open. This decision was arrived at by the promoters of the proposed cement combination after a series of conferences which have just been concluded.

It is also said that all efforts to get the Western manufacturers to join the combination have been abandoned for the time being owing to opposition on the part of the United States Steel Corporation.

Petroleum

May 5—The Standard Oil Company on May 4 announced a reduction of 5c. per barrel in crude-oil prices in all the Pennsylvania districts, in the Lima field in Ohio, and in the Indiana field. This is the first change in the Pennsylvania fields since March 9, 1907; and since Feb. 26, 1908, in the Lima field.

Chemicals

New York, May 5—The market is improving slightly. Deliveries on contracts are better and there is a little more current business.

Copper Sulphate—Sales are only fair. Prices unchanged at \$4.60 per 100 lb. for carloads and \$4.85 per 100 lb. for smaller parcels.

Arsenic—Current quotations are 2½¢@3c. per lb. for white arsenic. There is a slight activity owing to the possibility that a duty may be placed on this material.

Nitrate of Soda—Messrs. Mortimer & Wisner, New York, report the position of nitrate in the United States on May 1 as follows, in long tons:

	1908.	1909.	Changes.
Stocks, Jan. 1.....	5,900	9,140	I. 3,240
Imports 4 months.....	70,600	124,700	I. 54,100
Total Supplies.....	76,500	133,840	I. 57,340
Deliveries 4 months.....	73,030	122,440	I. 49,410

Stocks, May 1..... 3,470 11,400 I. 7,930
Afloat for U. S. 80,000 58,000 D. 22,000

Quantities afloat include all cargoes due to arrive at U. S. ports by Aug. 15 next.

Imports and Exports—The imports and exports of chemicals and raw materials in the United States, three months ended March 31, were as follows:

	Imports.	Exports.	Excess.
Copper sulph. lb.		1,719,158	E. 1,719,158
Bleach, lb.	22,877,205		I. 22,877,205
Potash salts, lb.	100,106,429	1,075,569	I. 99,030,860
Soda salts, lb.	3,116,504	180,826	I. 2,935,678
Acetate lime, lb.		24,823,461	E. 24,823,461
Nit. of soda, tons	88,592	2,051	I. 86,541
Phosphates, tons	847	247,375	E. 246,528
Sulphur, tons.	6,306	6,564	I. 258
Pyrites, tons.	157,696		I. 157,696

Exports include reexports of foreign material. Estimating sulphur contents of pyrites, the total sulphur imported was approximately 69,384 long tons.

Mining Stocks

New York, May 5—The general stock market has been irregular. In the first part of the week they were rather quiet, but on Monday the announcement of the Supreme Court decision on the Hepburn law started a movement, which was not altogether confined to the railroads directly interested, but extended to other stocks. The decision was variously interpreted, but on the whole was considered favorable to the railroads.

The Curb market followed the lead of the Exchange, having been quiet during the first part of the week, but rather active and excited in the second half. Buying was pretty well distributed, the copper shares attracting quite a number. Nevada gold stocks are in rather better demand and were sold quite freely. Cobalt shares were strong and inclined to advance. The general tone of the market was good and it closed strong.

Boston, May 4—There has been a gradual broadening tendency in the mining-share market, which has asserted itself,

particularly the past week. As yet the public has not taken any great interest, but if prices continue to harden it is only a question of time.

Mass mining has been the bull card in this market, and it has been active in this specialty. From below \$9 a week back, it touched \$15.12½ today. The new lode at a depth of 1700 ft. has opened up some of the most promising ground yet seen in the mine. This strike has called attention to the South Range group and all of them have had active periods. Lake Copper is up over \$5 to \$24.62½ for the week, while North Lake touched \$8.25 today, or above its original subscription price of last summer.

North Butte has advanced over \$10 in the week's time, touching \$67. The sharp decline early in the year has had no official explanation, except that the vein at a depth seemed to split. There has been some question as to the continuance of the \$1 dividend rate, but 75c. per share is bid for the next on 1000 shares.

The Boston Consolidated underwriting syndicate, it is understood, was obliged to take about 15 per cent. of the new issue of 50,000 shares of stock offered at \$11. Application will be made to list Nevada Consolidated on the New York Stock Exchange. It is listed on the local exchange.

On the Curb First National sold down close to \$5. Activity has centered largely in the low-priced issues, but a general improvement in the tone is noted. Corbin Copper had a sharp advance to \$10 today.

Industrials

Traylor Engineering Company, Allentown, Penn., has received an order for a 46-in. by 160-in. blast furnace complete from the Bankers Mining and Development Company, 50 Wall street, New York City. This is to be installed as the first unit of a very large equipment.

The Denver Fire Clay Company has completed arrangements to carry a complete stock of assayers' and chemists' supplies, heavy chemicals, microscopical goods, school and college apparatus, etc., in Salt Lake City, Utah, and expect to be able to make deliveries from there by May 1.

The Wood Drill Works, of Paterson, N. J., has issued a special circular printed in two colors, entitled "You can't drill rock with wood, but you can do it with a 'Wood' rock drill." Which treats on the material used in the machines and that repair parts are now carried in stock at New York City. These circulars are being distributed through their agents, Harold L. Bond Company, 42 Broadway, New York City, and 140 Pearl street, Boston, Mass.

The Sprague Electric Company, New York, is sending out a new catalog, No. 424, describing its various types of conduit, conductors, boxes, fittings, etc. Among the newer types may be mentioned the single-strip flexible-steel conduit which is designed especially for fire-proof construction. Special mention is also made of the new multilet box, which is one box with many uses. The catalog is covered with an imported stock known as cloud paper, which gives it an attractive appearance. A copy will be sent to anyone upon request.

The Crocker-Wheeler Company, of Ampere, N. J., recently received an order through its Denver office for a number of small motors which will be installed in the plant of the Cox-Clark Engraving Company, Barclay building, Denver. The motors will be used for individual drive on engraving and electrolyzing machinery as follows: A 3-h.p. motor driving a planer; a 1-h.p. motor driving a router; a 1-h.p. motor driving a saw; 1/2-h.p. each on a trimmer, a beveler and a tub router; and a 1/2-h.p. motor driving a jig saw and drill. These are all 230-volt direct-current motors of the celebrated form L type, which is built in sizes from 3/8 to 7 1/2 h.p.

A novel style of slide rule capable of performing a wide variety of calculations, and on this account called the Polyphase slide rule, will be of interest to all whose labors involve arithmetical or trigonometric computations. It is made in a similar form to the ordinary Mannheim slide rule, being a little wider in order to accommodate an extra scale upon the slide, and has been pronounced by all who have seen and used it to be an especially serviceable rule, and one upon which a wide variety of calculations may be readily handled. In addition to the regular a, b, c, d and trigonometrical scales of the ordinary slide rule, the polyphase has on the face of the slide an inverted e scale between the b and c scales, and on the edge of the rule in place of the millimeter scale is placed a scale of cubes. This arrangement enables squares and square roots, cubes and cube roots and a wide variety of combinations, such as the 4th, 5th, 7th and 11th powers and 6th roots to be taken with one setting of the slide, and the position of the inverted e scale on the slide enables many problems involving three factors to be performed at one setting also. The advantage of this arrangement lies not alone in the lessened time required to work an example, but also in the increased assurance of accuracy due to a fewer number of settings. In a circular which is furnished with this rule 70 different examples showing a wide variety of problems involving roots, powers and combinations illustrate the manifold uses to which the polyphase slide

rule may be put. Nor are these difficult either, as the arrangement of the scales is so simple that their relations may be readily grasped and new combinations especially applicable to the particular work in hand easily worked out upon them. This slide rule has just been brought out and placed upon the market by Keuffel & Esser Co., New York City.

It is always interesting to chronicle the half century of development and continued success of any concern, for it means not alone that the business has run along for 50 years, but that the line of manufacture has stood the test of time, has secured a permanent place as an integral part of the world's working tools, and has kept pace with the mechanical advancement of the times. Fifty years ago, two brothers, Phlinder H. Roots and Francis M. Roots, operated a woolen mill by water power. Conceiving the idea of using the rotary pump principle as a water motor, they built one of wood—case, impellers and all, except the shafts and bearings. Naturally, the machine swelled on being introduced to its driving element and it was taken to a small stove foundry to be loosened up. On re-testing with a belt drive, the foundryman noticed the air coming from the discharge pipe and remarked that he believed the machine would melt iron. The suggestion was adopted and the "grand-daddy" of Roots blowers built and put in successful operation. The clearances were, let us say, liberal, but the type, with minor modifications, endures today. Changes in impeller forms, modifications in bearing design, convenience of adjustments, and standardization are all improvements that might be said to be due to the improvement in shop methods and machine design—making the close clearances of the present day's design not only possible, but practical. The original use, for foundry work, soon ceased to be the only field. New uses constantly sprang up and an era was reached when the blower was first used as a foul-gas exhauster. Copper blast furnace furnished the next incentive to better machines for heavier duty, then trunk-line distribution and high-pressure pumping, together with air for filtration beds, are among the later developments. Now comes the vacuum-cleaning business, with its market for small machines, at vacuums ranging from 6 in. to 18 in. mercury. Thus, during 50 years have new problems constantly come up, just as regularly solved, and each has added its quota to the development of the high grade, serviceable and efficient machine of today. The business has always been in the hands of the original Roots Brothers, or their descendants, just as the design varies little from the original conception. Many men have given many masterpieces to the world, and not the least of these is the evolution of a type of machine that has endured for 50 years and so far shows no sign of decay, but rather, gathers life and usefulness as its age increases.

But a few months ago science celebrated the tercentenary of the birth of Evangelista Torricelli, mathematician and scientist, of Florence, Italy. About the year 1643 he made known one of the greatest scientific discoveries—a method of ascertaining the weight of the air by means of a mercury column. This mercury column was for a long time called the "Torricellian Tube," after its inventor, and the vacuum it includes is still known as the "Torricellian Vacuum." As soon as observations of this instrument were made it was found that the rising and falling of the mercury column had an evident connection with the weather. Otto Von Guericke, of Magdeburg, is the first on record who used the barometer as a weather glass. In 1747 Benjamin Franklin divined that certain storms had a rotary motion, but it remained for Redfield, Espy and Aube in about the middle of the 19th century to gather the data and completely establish the truth of that which the great Franklin had dimly yet wonderfully outlined. With time, changes have been made in the instrument, and today the mercurial barometer is the accepted standard instru-

ment for determining atmospheric pressure, and the highest grade instrument is capable of determining it to the third point of a decimal. Since this instrument must be about three feet in length, it is very cumbersome and not at all portable, so for obtaining gradients on railroads, elevation of hills and mountains, depths of mines, etc., one has to resort to an instrument that is compact, light, portable and above all things, accurate. This is the "Aneroid" barometer. An instrument containing no fluid, as its name implies. It was originally the invention of a French instrument manufacturer, Vidi, but has been perfected by English makers, and today an aneroid of high grade can be depended on at all pressures to 15 in. In the most portable forms for engineers or tourists they are made in two sizes, 11 in. and 2 1/2 in. in diameter, but preference should be given to the larger size, since in this size the vacuum and different levers on which the movement depends can be made larger, consequently the instrument is capable of finer adjustment. The altitude scales vary from 3000 ft. to 20,000 ft., and the subdivisions of these scales are governed by the altitude scale itself. The 3000-ft. dials are subdivided to 10-ft. divisions, while the 20,000-ft. dials are in 100-ft. divisions. The value of these instruments cannot be gaged by their external appearance. Accurate and consistent readings depend upon many things, the chief of which, as with all technical instruments of high class, is the skill of the workman. More depends upon his knowledge of the relation of each part to the whole and their technical adjustment to each other, than upon any other factor. High grade barometer manufacture calls for labor equally skilled with the highest class watchmaking. One of the difficulties to overcome is the tendency of the metal forming the vacuum chamber to "creep," which means that when exposed to a sudden change from a high altitude to a low altitude the metal, owing to the strain resulting from the difference in atmospheric pressure, will not return quickly to its normal state, causing appreciable error in barometric reading. This is overcome by expert knowledge of the character of metals and being able to test and select for high grade instruments only such vacuums as show a negligible degree of "creep" under varying pressures. The metal employed in the forming of vacuum chambers for the best instruments measures but .004-in. in thickness. Compensation is an essential feature in all instruments of this character. It is accomplished by making the main lever of two different metals, steel and brass. Many instruments bear the word, "compensated" on the dial, yet when examined inside no trace of such can be found. Since the air is subject to great changes in temperature it is necessary to compensate against these changes or the unlooked-for errors will mean useless results and waste of time. Instruments of the highest grade have the regulator (where the final adjustments are made) working in a cupped-out-brass screw, into which works a hardened-steel point, insuring greater delicacy and consequent accuracy. The writer had the opportunity some time ago of visiting the factory of Short & Mason, Ltd., London, Eng., whose reputation for high grade barometers of any description is world-wide. Some of the chains used in the fine instruments were so small that 30 links covered but an inch of space. Some of the instruments had the official certificate of the National Physical Laboratory with them, at times showing errors of only 0.002 inch. The types known as surveying or mining barometers having dials from 3 in. to 5 in. in diameter are made to read by means of vernier to single feet of elevation and are so sensitive to changes in pressure that when lifted from the floor the change in elevation is readily detected in the movement of the hand. The table of equivalent altitude compared to inches of pressure as laid out by Prof. Airey, the astronomer royal of Great Britain, has been accepted as a standard scale and all barometers having altitude scales are divided and figured according to it.

The Diamond Bearing Highlands of Bahia—I

No Eruptives in the Lavras Series, the Immediate Source of the Diamonds; Carbonados the Most Important Product. Dredging Possibilities

B Y J. C. B R A N N E R *

It is doubtful whether there is anywhere in South America a region of so much economic importance and scientific interest, and which is at the same time so little known, as the interior of the State of Bahia. This is especially true of the

portions of Brazil, it was only in the year 1907 that I undertook to see the region here referred to. The trip was made for the purpose of determining the sequence of the rocks, and of working out the general geologic structure with special refer-

neither of them penetrates it. The Bahia & São Francisco railway runs from the city of Bahia to Joazeiro on the upper São Francisco by way of Alagoinhas, Queimadas and Villa Nova, a distance of 574 km. On this line there is at present

LEDGES OF PINK QUARTZITE NEAR LENCÕES

From these the earth and soil have been scraped by miners in search of diamonds and carbonados. After being washed the coarse materials are piled on the flat bare surfaces.

THE RIDGE OF DIAMOND-BEARING PINK QUARTZITE

North of Andaraí, the rocks are false bedded, jointed, and sometimes faulted. The earth has been cleared out and the loose small stones are left piled on the larger ones.

OLD DIAMOND WASHING AT MOSQUITOS, NEAR LENCÕES

Showing the white shales that underlie a diamond-bearing bed. The gulleys in the foreground were formed since the washings were abandoned.

A TRAIL ACROSS THE SALITRE VALLEY THROUGH A CHARACTERISTIC CATATINGA FOREST

portion of the State lying south and southeast of the Rio São Francisco and northwest of the city of Bahia a large part of which is known as the Chapada Diamantina, or the diamond-bearing highlands. Though I have for many years been fairly well acquainted with other

ence to the distribution of the formations in which diamonds and carbonados are found.

TRANSPORTATION AND CLIMATIC CONDITIONS

This part of the interior of Brazil is best reached from the port and city of Bahia. Two railways approach it, but

a change of gage at Alagoinhas. In order to reach the region under consideration from this line, one may either take a boat up the São Francisco, and then travel southward on mule-back, or he can leave the railway at Queimadas or Villa Nova and make the rest of the trip with mules.

Another route is by rail from Cachoeira, just north of Bahia, to Bandeira de Mello,

*Professor of geology, Stanford University, California.

and sharp ridges examined are of quartzite whose beds stand nearly or quite on end, while the country on both sides is of granites, gneisses, schists and old eruptives.

THE JACOBINA RANGE

The Serra de Jacobina is the most prominent mountain range of the region. Its southern end is about 30 km. south of the city of Jacobina, and it runs nearly north past Jacobina, Saude and Villa Nova, and at this last place it swings slightly westward and disappears on the plains south of the Rio São Francisco about 50 km. south of Joazeiro. The rocks of the Jacobina range are conglomerates, shales, talcose schists, and quartzites of the kind commonly known as itacolumites. The beds are highly tilted, often on end, and throughout the entire length of the mountain range, when not on end, they have a high east dip, and the same strike as the mountain range itself. It is to be noted that this great range has the crystalline rocks on both sides of it. Lithologically this series of rocks resembles closely what was formerly known as the itacolumite series of Minas, but has lately been called by Derby the Minas series.

THE TOMBADOR RANGE

West of Jacobina is the great Tombador range of mountains that rises like a vast vertical wall formed by the edges of a series of nearly horizontal sandstones and quartzites that rest directly upon the old crystalline series. The Tombador beds here dip gently westward beneath the Salitre valley, and can be traced northward

colored shales that form the surface rocks over large areas. In some places these shales closely resemble the Devonian shales of central New York, in others they are more nearly like the Mauch Chunk red shales of Pennsylvania. They have

HEAVY QUARTZITIC CONGLOMERATES

Part of the diamond-bearing series, Pedra Pintada, west side of Salitre valley.

Lavras series. These beds have an approximate thickness of about 700 meters. The diamonds and carbonados are from this series. In connection with the geology of the diamonds and carbonados it is of the utmost importance to know the upper and lower limits of the series yielding these stones. Fortunately the Caboclo shales that underlie the diamond-bearing beds are clearly defined and readily distinguished.

Above the Lavras beds is a series of red sandstones very like the Triassic red sandstones of New Jersey and Connecticut, and I have called them the Estancia red beds. These are in turn overlaid by the Salitre limestones which cover a large area in the interior of Bahia. The rocks of later age in the State of Bahia are not so well developed in the diamond region, and need not be mentioned here.

SECTION OF THE CHAPADA DIAMANTINA

The accompanying section gives a resumé of the rocks of the Chapada Diamantina with the names of the series and their estimated thickness:

Names.	Thickness in Meters.	Ages?
Salitre limestones and marbles	350	Jura.
Estancia red beds	350	Trias.
Lavras series	700	Carboniferous
Cambao quartzites.	100	Devonian.
Caboclo shales...	500	
Jacupe flints	100	
Tombador quartzites...	400	Silurian.
Minas series	1000	Cambrian.
Crystalline		Pre-Cambrian (in part).

CHARACTERISTIC FRETWORK WEATHERING

The diamond-bearing quartzites, Pico Annibal, east of the Almas valley.

CHARACTERISTIC FALSE BEDDING

The diamond-bearing quartzite at Sirio Retiro, on Rio Ingaizeira, west side of the Salitre valley.

by their bold topography to the vicinity of the Rio São Francisco, where they cap the flat-topped mountains or form the monoclinal ridges that characterize the topography of that region.

Above the Tombador sandstones is a series of flinty beds that I have called the Jacupe flints, and these are followed in ascending order by a great series of gray, red, yellow, black and cream-

a total thickness of about 500 meters. This series is named Caboclo, from Serra do Caboclo on the Ingaizeira estate on the west side of the Salitre valley.

THE DIAMOND BEARING LAVRAS SERIES

Next above the Caboclo shales is a series of false-bedded pinkish sandstones, conglomerates and quartzites the upper part of which is called by Derby the

It should be distinctly understood that the ages assigned these various series are hypothetical, and based solely upon lithologic characters and physical breaks. Diligent search has been made for fossils, but nothing has thus far been found in the entire section here given. Within the area represented on the accompanying map the Cretaceous rocks about Bahia and extending north from that place are

the oldest ones in which fossils have yet been found. The uncertainty regarding the precise ages of the various series, however, does not affect the validity of the divisions or of their sequence.

DIAMONDS AND CARBONADOS

Diamonds and carbonados are here treated together because they are found together in this particular field and in this field only. The most important existing mining industry of Bahia is that of diamond washing, including both the ordinary diamonds of commerce and the carbonados or black diamonds. Ordinary diamonds have been mined in the Chapada Velha, state of Bahia, since about 1830.

WASHING FOR DIAMONDS AND GOLD ON THE RIO ITAPICURU BELOW QUEIMADAS

They were discovered in September, 1844, on the Rio Mucujé at the spot where the city of São João do Paraguassú now stands, and a little later they were found about Andarahy and Lençoes. Up to about 1856 carbonados were not supposed to have any value, and no effort was made to save them; since that time they have had a market value, and now they are the chief object of mining operations throughout the diamond district.¹

Heretofore it has not been possible to state the area of the diamond-bearing rocks, chiefly because the geology of the region was not known. The first, and indeed the only geologic study hitherto made of the Bahia diamond district was one by Prof. O. A. Derby,² who spent a week or two in the region about Lençoes in the year 1905. The region supposed to yield diamonds has been variously estimated,

and is usually made to include enormous areas of the overlying limestone or of underlying formations, while extensive tracts have been overlooked because no one knew the distribution of the rocks in which the diamonds are found. The studies made by me during the year 1907 have made it possible to outline for the first time the geology of the diamond region of Bahia and to determine the distribution of the diamond-bearing beds.

Referring to the geologic sequence of the rocks given above it will be seen that the Lavras series of rocks is made up of conglomerates, sandstones and quartzites that have a thickness of about 700 meters, are provisionally referred to the Carboniferous.

residuary materials gravitate to the streams, and are there concentrated. Over a large part of the slopes of hills and mountains where the beds of this pink Lavras series form the surface rocks, the diamond washers have scraped and gathered the disintegrated rock from every crevice and cranny with the utmost care, and in this material the diamonds and carbonados are found.

In the valley north of the town of Andarahy one can hardly find a spoonful of disintegrated rock in place today, so carefully has it been removed by the diamond washers. One of the accompanying photographs shows how the small stones are pulled out and piled on top of the large ones in this search for the decomposed sandstone. Inasmuch as the pinkish Lavras quartzite is the top rock through most of the diamond region, this habit of the experienced miners is accepted as evidence that it is from these quartzites that the diamonds are derived.

IMMEDIATE SOURCE OF THE DIAMONDS

In the elevated region in the vicinity of Morro do Chapeo the rocks of the Lavras series are the highest beds, and they are but slightly folded. There the streams rise in and flow for miles in the pinkish quartzites, and the diamonds and carbonados are taken from the beds of these streams. Many similar illustrations might be mentioned, but these are sufficient to show that there is no question about the immediate source of the diamonds in this district. Cases of diamonds in place in these quartzites have been reported to the writer, but though he has never personally seen such specimens, the geologic evidence

ercus. These rocks are of a marked pinkish color, except where they have long been exposed to the weather when they commonly, though not always, become white. They are strongly and almost universally false bedded, and are often covered with fretwork on weathered surfaces.

THE PINK LAVRAS QUARTZITE

A sample of the typical pink quartzite was taken in the midst of the diamond washings between Lençoes and Andarahy and an analysis, made by L. R. Lenox, gave the following results: Silica (SiO_2), 97.04 per cent.; oxides of iron and alumina (Fe_2O_3 and Al_2O_3), 1.08; lime (CaO), none; magnesia (MgO), trace; total, 99.92. The composition is about what one would expect from an examination of the rock. The pinkish color is due, no doubt, to the small percentage of iron which is very evenly distributed through the rock.

Though it is here confidently stated that both the diamonds and carbonados come from this series of rocks, the writer has never seen either a diamond or a carbonado in place in any of them. The washings, however, are always along streams that flow in or over these beds, or at the edges of them, where the detrital and

WAYS AND MEANS

Travel in the interior is mostly on mule back, and the roads are trails.

is all in favor of the theory that the diamonds and carbonados come directly from the Lavras beds.

At the town of Ventura the diamonds are found in a deep gulch sunk in the Caboclo shales, and several hundred meters below the Lavras series. The diamond-bearing beds, however, cap the hills on one side of the gulch, while the stream that flows through that gulch is fed by many branches that rise on the high plateau of the Lavras rocks to the north and west.

One may also hear occasionally of dia-

¹The carbonados are commonly known as carbons or black diamonds. The following articles give information regarding the carbonado business. U. W. Furness in *U. S. Consular Reports*, LXX, 90-97, Washington, 1902; same volume, pages 145-154; same author in *Popular Science Monthly*, LXXIX, 272-280, New York, September, 1906.

²O. A. Derby, "The Geology of the Diamond and Carbonado Washings of Bahia, Brazil," *Economic Geology*, 1, 134-142; the same in *Southwestern Report for 1906*, pp. 215-221, Washington, 1907.

monds found in the region east of the area of the Lavras beds. The miners commonly speak of these stones as river diamonds, for they are usually or always along streams that flow from the diamond bearing rocks, and it is understood that they have been carried down by the streams from the diamond region proper.

In 1898-9 diamonds and gold were found on Rio Itapicuru about 40 km. below the town of Queimadas. Diamond washing was carried on in a desultory way from the Fazenda Conceição to Fazenda Boa Vista, a distance of 65 km. down the

occurrence of diamonds hundreds of kilometers away and over the region as a whole.

Among the crystalline rocks that underlie the sedimentary rocks of the diamond region the writer has found a considerable area of serpentine that suggests the possibility of the diamonds having originated in peridotites of the old crystalline series and having been passed down to their present position in the Lavras beds through several geologic generations.

Once the diamond-bearing formation and its stratigraphic relations are recognized, the areal distribution of the diamonds is readily determined in the field. This is due partly to the simplicity of the geologic structure, and partly to the marked contrast between the rocks of the Lavras series and those both above and below them. Over most of the region the beds are gently folded and remind the geologist of the region of folded rocks in the anthracite region of northeastern Pennsylvania. About Morro do Chapeo the folds are quite gentle but north of there, and especially in the mountains west

These instances are sufficient to show the nature of the geologic problems connected with the diamond-bearing rocks. As is to be expected in such structure the area over which the diamond bearing rocks are exposed is not one single compact area, but a number of irregular areas separated by the denudation of anticlinal folds, by the burial of the synclines beneath later deposits, by faulting, or by the overlapping of later deposits. In some cases the diamond-bearing beds outcrop along narrow zones for long distances; in others they widen out over areas covering hundreds of square miles, and in still others they are mere remnants of the original beds. The accompanying map is necessarily on too small a scale to attempt to give more than a general idea of the distribution of the rocks of the Lavras series. The details, however, are readily worked out on the ground.

PRODUCTIVE AREA BETWEEN SINCORA AND MORRO DO CHAPEO

The region that has thus far produced most of the diamonds and carbonados lies

CARIMBÉ AND BATEA

When earth has to be moved, it is carried on the head in shallow wooden bowls called carimbés. Washing for diamonds is done in bateas—large, deep, wooden bowls. The one on the man's head is a carimbé; the one on the ground is a batea.

river. Not enough is now known of the details of the geology of that part of the State to be sure whether the diamonds found there come from an infolded or infaulted portion of the Lavras beds, from the removal of the Cretaceous sediments, or from some other independent source.

ABSENCE OF ERUPTIVE ROCKS

It should be added that no eruptive rocks occur in connection with the diamond- and carbonado-bearing rocks over the greater part of the district. That is, the diamonds cannot be attributed to the influence of eruptive rocks on the beds in which they are now found. Some basic dikes are said to traverse the Lavras beds and the overlying Estancia beds and the Salitre limestones both east and west of the Serra do André, but these reports require confirmation. But in no case can such dikes have anything to do with the

WASHING FOR DIAMONDS AND CARBONADOS IN THE BAHIA REGION.

From a photograph.

of Grana, the folds are closely pressed and merge into faults. In other places there are faults that have let the diamond bearing beds down until one edge is carried far below the underlying Caboclo shales. The accompanying section across the Almas valley will give an idea of the general geology of that part of the diamond region.

ROCK STRUCTURE NEAR ALAGOINHAS

The structure in the vicinity of the village of Alagoinhas of Jacobina Nova is shown in the north-south section across Riacho da Boa Sorte. At this place the Lavras beds were limited on one side by a fault and on the other by the base of the series. It was thus surrounded by the underlying shales. Often the outcrop follows for many miles along the side of a mountain range, rising here and there to its crest. Again these beds form outliers, or they cap outliers made up mostly of the underlying formations.

WASHING FOR DIAMONDS AND CARBONADOS IN THE BAHIA REGION

From a photograph.

between Sincora on the south and Morro do Chapeo on the north. The reason for the productiveness of this particular belt is not certainly known at present. It may be due to the greater richness of the rocks, or it may be due to the fact that it is only here that there is an abundance of water for hydraulic mining. Outside of this better worked zone water is either altogether wanting or it can be had only during the rainy season of the year, which is usually very short, and sometimes fails altogether.

It is also worthy of note that, except locally, the diamonds and carbonados are not exclusively confined to any particular part of the Lavras series. About Morro do Chapeo, for example, they come from one part of the series, and about Lençoes and Andaraí from another. One of the accompanying photographs, made at Mosquitos, shows a sharp line of demarcation between beds in the Lavras series that are productive above and barren below.

MINING METHODS

The mining methods used in the search for diamonds are mostly of the rudest possible kinds. The work is all done by hand, and there is practically no machinery used in the district with the exception of a small electric plant and a little miscellaneous machinery belonging to one foreign company near Lençoes.

The Brazilian method of washing the diamond-bearing gravel was first described by John Mawe in his "Travels in the Interior of Brazil" published at London in 1812.¹ It is interesting to note that the methods described by Mawe a hundred years ago are still in use in Brazil wherever diamond mining is done on a con-

with a simple yes or no. Diamond washing is a peculiar business in this respect, that the values are so concentrated that the element of personal honesty of the employees is a matter of the utmost importance. A single diamond worth thousands of dollars may be found, secreted, and carried away by a diamond washer, even when closely watched.

Under the system now in vogue this risk is not important, or rather it is seldom taken, because there are no large companies employing many diamond washers. The work is chiefly in the hands of individuals working independently. A man who leases a piece of diamond-bearing ground may employ helpers to

water, they have never been able to get at what is probably the richest of the deposits. It naturally occurs to one that some adaptation of modern gold dredges could be used to advantage in these low grounds.

Another point that is probably in favor of the dredging of these marshes is that during the first 12 years of diamond mining in the Lençoes district the carbonados were not known to have any value. According to official statistics those 12 years were among the most productive in the history of the region. And during that entire period the carbonados were thrown aside with the tailings and were of necessity washed with other waste into the swamps from which they could not be recovered by any methods with which the native diamond miners are familiar.

The objection to dredges in such a place are: (1) The difficulty of transporting the heavy pieces; (2) that one is here a long way from the factory and from repair shops. However, there are railway repair shops at Cachoeira, Bahia, and Alagoinhas, where all ordinary repairs can be made. The transportation of the large and heavy pieces of a dredge beyond the end of the railway can be obviated partly by the use of boats on the Paraguassu river above the end of the railway at Bandeira de Mello, and partly by opening wagon roads over the rest of the distance. It is also highly probable that the railway will soon be extended considerably beyond its present terminal station.

At the end of this article something will be given concerning the mining laws of the state and the conditions under which the diamond lands can be worked.

(To be continued.)

siderable scale and are, indeed, the only ones thus far employed in the diamond regions of South America. When operations are on a small scale, the methods are modified to meet the requirements. The soils and gravels are concentrated by various crude processes, which consist of stirring the materials in the bottom of a stream, or by dashing water against a pile of gravel while it is being stirred. The final "clean-up" is made in large wooden bateas or bowls, the diamond washer standing in the water as shown in the accompanying drawings which are made from photographs.

HAND VS. MECHANICAL EXPLOITATION

The question naturally arises whether with modern mechanical appliances and mining methods, the mining for diamonds and carbonados could not be made much more lucrative than it is at present. This question, however, cannot be answered

make ditches, to do digging, to remove earth, or boulders, or to help in any way that may be necessary, but when it comes to the washing of the gravels or the final "clean-up," that work is usually done by the holder of the lease alone, or by some one in whom he has perfect confidence.

Another point about machinery is that over much of the diamond-bearing ground the amount of material to be washed is too small to warrant its instalment and the frequent removals that these small deposits would entail.

POSSIBILITIES OF DREDGING SWAMP LAND

On the other hand, there are places where the local conditions suggest that machinery might be used to great advantage. For example, at certain places the topography is such that there are extensive tracts right alongside of rich diamond-bearing ground permanently buried beneath swamps that cannot be drained. The native workmen have worked the ground right down to the edges of these swamps, but being unable to shut off the

Tonopah Mining Company of Nevada

During the year ending Feb. 28, 1909, 234,017 wet tons were hoisted from the Mizpah, Silver Top and Red Plume shafts, of which 155,401 dry tons of ore averaging \$23.43 per ton, were shipped to the mill at Millers; 7957 tons were placed in storage at Millers for emergency use; 13,635 tons of low-grade ore were placed on the dump, and 50,260 tons of waste rock were hoisted. Mining cost per dry ton of ore shipped, including cost of sinking shaft, diamond drilling and station, was \$4.80.

There were milled and treated 158,052 dry tons of ore averaging 0.354 oz. gold and 31.13 oz. silver per ton, making the total metal contents 55,884 oz. gold and 404,404 oz. silver. The average recovery of both gold and silver was 90.3 per cent. The total milling cost per dry ton of ore was \$4.165. Upon comparison with the previous year, this indicates a reduction of \$1.746 per ton in the cost of milling. The dividends amounted to \$750,000.

¹An American edition of this book was published at Philadelphia in 1816. The process of washing diamonds is described at pp. 220-232 of the American edition.

Silver-Lead Mining in Freiberg, Germany

Mining Began in the 12th and Reached Its Zenith in the 19th Century;
Academy Founded 1766. Four Types of Veins; By-products Important

BY WILTON G. BROWN*

Freiberg in Saxony has always been full of interest to the geologist on account of its famous examples of "gang structure." Just now, however, a peculiar interest attaches to the place, owing to the announcement of the King of Saxony that he will soon close the Freiberg silver mines which have worked continuously for 750 years. These Saxon mines with one exception are owned and operated by the government, and for the last few years have been worked at a heavy loss. This fact, of course, accounts for the edict which sets 1912 as the date for closing.

GEOLOGY

The Freiberg district lies on the long northwest slope of the Erzgebirge at an elevation of about 1300 ft. The surface has been cut into something of a basin by the Freiberger-Mulda river. From the Freiberg district to the north and east stretches a vast alluvial plain which in some places has a depth of more than 1000 ft. Structurally, the section is a dome of which Freiberg is about the central point. The country is biotite-gneiss. The movement which pushed up the dome is also responsible for the metamorphism of the older biotite-granite into the present Freiberg gneiss. Underneath this dome of gneiss lies a stock or batholith of later granite which was probably forced up during the same disturbance which formed the dome. Dikes of mica-syenite, mica-diorite and quartz porphyry are also found cutting the gneiss. These dikes are probably Upper Carboniferous; they are not mineralized and are older than the ore veins.

The Freiberg veins are classified as follows: (1) High-grade quartz veins; (2) Silicious lead veins; (3) High-grade lead and iron carbonate veins; (4) Barite, lead and silver veins. Of these types the first is the oldest and the last the youngest. There are two sets which follow the fault planes in the gneiss of the dome, one running about northeasterly and the other northwesterly. The veins in the granite stock do not carry ores, and this of course suggests a deeper source—an idea which is further supported by the wide extent of the ores. Probably the most extensive vein in the whole district is the "Hohe Birke" (high birch), which has been mined for a distance of four miles and to a depth of 1500 ft. The ores remaining are, for the most part,

silicious and must be concentrated. Bunches of high-grade ore are broken down on canvas, packed in sacks and sent directly to the smelting furnace.

EARLY HISTORY

Mining was undertaken in Freiberg about the time of the third crusade, 200 years before the fall of the Eastern Roman Empire, and 300 years before Columbus set out on his voyage of discovery. In 1162 a salt miner from Gosslar brought a load of salt cross-country to Bohemia. One day he picked up in the road a chunk of lead ore seamed with silver. This was a little later the site of one of the best producing mines of Freiberg. News of his discovery spread through the Harz mountains on his return, and when a little later, there was trouble in the Harz mines, many miners went to the new Saxon fields.

"Otto the Rich," then Margrave of Saxony, went into the mining business when silver was found. Leases were made on the basis of "ten per cent. of smelter returns," with the additional proviso that the Margrave could buy all the silver output of the smelters. Having thrown all the burden of operating on others, Otto wanted all possible revenue and so threw open the district to prospectors. This gave to the town its name Frei Berg. By the middle of the 13th century mining in the district had assumed such importance that the government mint was located at Freiberg.

CRUDE METHODS

In the early days mining methods were primitive and consisted chiefly in "gophering" for streaks of native silver. A large mine employed perhaps 8 or 10 men, and nearly every mine had its own little smelter. The mines were operated for 400 years before the introduction of pumps, and for 500 years they worked without powder. Many miles of workings were driven with only hammer and wedge. When the ground became too solid a fire was built at the face to fissure the rock a little and to permit the wedge to enter.

ERA OF GREATEST PRODUCTION

The zenith of mining came in the third quarter of the 19th century. During that period as many as 9000 men were employed. Production of both mines and plants was crowded to its utmost. At

the present time mining has dwindled until only about 2000 men are employed, and out of more than a score of properties which were working here a few years ago only two government mines and one independent mine are operating. This independent mine is being operated on a more economical basis than the government properties, and as a result shows profit. It will not be closed with the government mines. The term mine as used here means a group of mines which have more or less connected workings. Thus, for example, "Himmelfahrt" mine has five separate shafts and plants, each of which would be termed a mine in America. The separate groups are so far connected that one may travel in underground galleries almost from one end of the district to the other. Masonry or brick arches take the place of timber in the upper workings and old railroad rails serve for stulls in the recent portions. Very little timber is used.

The names given to the mines echo the strong religious tendencies of Saxony. Translating typical names, they read as follows: "God with us," "Help of God," "Christ's Gift," "Heaven's Ruler," "Road to Heaven." Further evidence of the religious tendencies is the fact that miners are compelled to attend chapel exercises each morning before going to work. So the miner attends morning prayer at 4:40 in the morning, goes on shift at 5 and is off shift at 3 o'clock in the afternoon.

Practically the only advance made during the 15th century was the adaptation of water wheels to hoisting. Once introduced, these rapidly came into general use. The 16th century saw the beginning of systematic work. Pumps were installed. A drop in the price of silver gave mining a bad setback in the first part of the 17th century. For the first time blasting was attempted. The 18th century was marked by scientific progress. The nine operating smelters were combined to form only three. All mining equipment was increased, bettered, and great improvement made in blasting practice. As an expression of increasing scientific interest, the Freiberg Mining Academy was founded in the year 1766. The practical benefits of this school were twofold: (1) Its professors made, in laboratory and field, the most careful and detailed study of veins, ores and

*Mining geologist, Helena, Mont.

minerals. (2) Its graduates were technical men fitted to direct mining operations.

In the 19th century there was considerable hardship over the matter of power. In 1844 the government began work on the "Rothschönberger" drain, finishing it some 30 years later. This tunnel drains all mines in the district to a depth of 1800 ft. and with all its branches has a length of almost 30 miles. The completion of the railroad at about the same time cheapened fuel and transportation, also making it possible to smelt foreign ores.

The total production of silver in the district is 6,500,000 kg., valued at \$230,000,000. I have been unable to find any tabulation of lead production in the Freiberg district or of the value of its by-products handled in more recent years. Of course these items count up rapidly as savings, but do not begin to offset the drop in the price of silver. The lead ores here are not massive enough to have any great importance for their lead contents, especially when lead is as cheap as it is today.

OPERATIONS IN 1908

In 1908 the King of Saxony lost something over \$200,000 on the Freiberg mines. This was due in large measure to the low price of silver, but it was even more due to the condition of the mines. They are now over 2000 ft. deep, and even under favorable conditions it is expensive to operate at this depth. It is worse, however, when operating with old machinery, old miners, and by hand work. Add to this the fact that the Freiberg veins are narrow, and it is not surprising that there is a loss. Miners here receive only 50 to 75c. per day, but judging from what I saw, it is about all they are worth. The men themselves are mostly old, without energy, and do little work; at any rate, cheap labor is not economical when the mechanical operating expense is large.

A private company in Frankfurt recently offered to buy the Freiberg smelters and mines from the government, including both those operating and those already shut down. The king agreed to make the sale if the purchasing company would agree to keep all the old employees. This was promptly refused, however. It is possible that some agreement may yet be reached with this company.

In the Freiberg district we have opportunity to compare private and state ownership of mines. Each seems to have its advantages. Of all the private mines only one is still operating, and yet it is making a margin of profit, while the government has been working its mines at a heavy loss for some years. No official is going to scrutinize his expense or labor bills quite as carefully as the man who

must foot them. There is no doubt that the government has put through large projects and has made its different mines work together better than private companies could have done. Yet, so far as actual operating expense is concerned, the balance seems to lie with the private properties.

CONCENTRATION, SMELTING AND REFINING

Concentration here is similar to American practice in most points, although the machinery is of different pattern. From the crusher the ore passes through Cornish rolls and all coarse material goes to jigs. The fine stuff is handled on tables which are between a Wilfley table and a vanner in that they have a traveling rubber belt, an end motion, and a side discharge like a table. The coarse concentrates are reduced by dry stamping to about 20 mesh before going to the smelter. Two smelters are in operation in Freiberg, and while these will not be closed with the mines it is likely that they may be combined into one plant. The bulk of their ore supply comes from Freiberg, but they receive much from other Saxon districts, and in fact from all over the world. One sees in the bins ores from South Africa, Australia, South America and even from Japan.

After sampling the ore takes one of four channels according to its nature: (1) That with 25 per cent. or more sulphur goes to the sulphur plant. (2) That with 28 per cent. zinc to the zinc plant. (3) That with 10 per cent. arsenic to the arsenic plant. (4) All other ores to the roaster or furnace of the lead smelter. All tails from the first three processes also go to the lead furnace. In the sulphur plant there are three types of roaster: (a) "Kiesofen," for egg-size ore, (b) three-stage "muffle ofen" for nut size, (c) "schütttrösten" for dried concentrates. This last type is really a stack containing many little platforms to tumble the material over and check its fall. The gas from these various roasters comes together into a central canal and goes to the lead chambers, where it is thrown down with steam and oxidized with nitric acid in the old-fashioned way. The waste gases from this plant go to the bag-houses and pass out with the fumes from the smelter. The six lead chambers have each over 3000 cu.yd. contents and when working full the capacity of the plant is 20 tons of sulphuric acid daily. Some of the acid is shipped crude for use in different factories, some is concentrated and refined on the ground, and still another part is placed in large vats with scrap iron to make iron sulphate for tanning and fertilizer. Permission to visit the acid-refining room is given only grudgingly since one of the big \$16,000 platinum dishes was stolen last year.

At the zinc plant, zinc is distilled with

coal and recovered as in Joplin. At present there are not enough zinc ores coming in to keep this plant in operation. The arsenic is recovered and refined by a secret process which is not open to inspection. The roaster and "hochofen" of the lead plant are similar to the American reverberatory roaster and lead furnace, but are operated somewhat differently. Both oxide and sulphide ores go through the reverberatory, and the charge is brought to such a heat that it fuses into a mass of matte, which is broken up for the furnace. The furnaces have no "lead well" and the bullion being drawn off direct is consequently dirty and mixed with matte. It must then go through a cleaning furnace before being cast into bars.

Refining is first done by crystallizing the lead through a series of kettles. Bullion from the lead end is then reheated and further cleaned with zinc before going out as pig lead. The silver bullion from the kettles carries about 2½ per cent. in silver and is further put through two oxidizing furnaces. The first of these turns out 70 per cent. fine silver, and the second removes the last of the lead as well as bismuth. The bismuth is recovered and refined. The refined silver is then granulated and electrolyzed to recover the gold and platinum.

The royal mint is connected with the smelter and only a mile or so distant are the royal lead factory and shot tower. The ores are mined, concentrated, smelted, refined and the metals used in Freiberg. The precious metals are stamped into coin and the lead manufactured into wares; the sulphur is made into acid ready for use in the arts or further converted into fertilizer; the arsenic is turned into commercial oxide; the platinum, bismuth, antimony and zinc are turned out in metallic form.

Experiments show that wire from Monell metal, rolled, annealed and cold drawn, has a tensile strength of 110,000 lb. per sq.in., the elastic limit being 80,000 lb. The metal is an alloy containing approximately 70 per cent. nickel, 30 copper, with a little iron and manganese. The Orford Copper Company has granted the sole right to make wire from this metal to the Driver-Harris Wire Company, of Newark, N. J. The metal is made from Canadian nickel-copper matte.

In 1908 the production of garnet in the United States, as shown by figures collected for THE MINERAL INDUSTRY, amounted to 2530 short tons only, valued at \$78,000. In 1907 the production was 6723 short tons with a value of \$200,895. The increasing use of artificial abrasives apparently restricted the production of garnet which is used as an abrasive in the manufacture of boots and shoes.

The New Oilfield in Utah

By A. P. ROGERS*

The southeastern part of Utah is one of the last portions of our country remaining to be thoroughly explored and settled. It has been practically inaccessible heretofore, for several obvious reasons, and was regarded of so little value that prospectors have left it severely alone. With the recent discovery of high-grade oil, conditions have changed. The district lies to the east of the Colorado river, where it cuts across the State, and along the course of the San Juan, before the deeper portions of the cañon have been reached. That is to say, between the settlements of Bluff City on the east and Oljato, or

by the folding of the earth's crust, have produced ideal conditions for oil deposits, and it is here all present prospecting is taking place. Bluff City is the nearest town, and there is only one railroad station anywhere near it—that at Dolores, Colo., on the Denver & Rio Grande Railroad, 80 miles away. Ten miles west of Bluff City lies the great Comb Wash, extending both north and south of the San Juan river for many miles, and from its western side an anticlinal fold rises over 1000 ft. above the river at its highest point. This is the eastern boundary of the field today. It can be followed west from this point more than 60 miles across two synclines and succeeding anticlines until the formation finally disappears below the surface near the Colorado river. Through these anticlines the San Juan

found in the West, and if it is obtained in quantity in other wells it will prove most valuable. No continued pumping has been attempted up to date, however.

As a result of these discoveries the surrounding country has been located for miles around, and large drilling machines, some with a capacity of 3000 ft., are being taken in to prospect the field in a systematic manner.

Anyone going into the district must make thorough preparations before starting; the summer weather is very warm and good water is scarce away from the muddy river. Supplies and equipment must be taken in, as practically nothing can be bought on the ground.

According to *Engineering*, April 2, 1909, a bill was recently introduced in the

NEW OILFIELD IN SOUTHEASTERN UTAH

Moonlight, on the west, and south of the Blue and Henry mountains. The oilfields proper are about 65 miles across from east to west, and perhaps 75 miles north and south. The existence of oil has been known to the few Mormon settlers for many years, but it remained for a man from the Texas fields to make the first important discovery and set up a driller. That was five years ago; but not until last spring did the public take much interest, and only recently have other rigs been taken in to push the work. Now there are six or eight drilling outfits on the ground, with others on the way.

The country is sandstone, of the Jura-Triassic and Cretaceous ages, with occasional igneous ranges breaking through it, north or south of the known oilfield. A series of anticlines and synclines, formed

river has cut deep cañons, and at various places oil seepages occur, especially from the lower sands close to the water. These cañons have exposed seven different oil-bearing sands in a depth of 1200 ft., varying in thickness from 3 to 60 ft., each one of which is sealed from the other by a strata of hard blue limestone.

In all, four wells were sunk up to December, 1908, the deepest of which is 320 ft., and the shallowest only 120 ft. Two of these struck oil and were gushers for a short time. The other two struck water in the upper sands, but as these were primarily sunk for assessment work, they are not classed as completed wells. The first and deepest well was sunk at the mouth of Grand gulch, encountering a fine grade of oil upon penetrating the fifth sand; this oil carries a higher percentage of volatile matter than any so far

French Chamber of Deputies proposing modifications in the present French patent laws. One modification provides for the loss of patent rights if the inventor has not worked the patent in France or her colonies within three years of the deposit of his demand, or shall have ceased to work it for three consecutive years, except for valid reasons. Working a patent almost exclusively or principally outside French territory, after a time fixed by the courts, will also be ground for revocation.

According to statistics collected for THE MINERAL INDUSTRY, the production of mineral wool in the United States in 1908 was 9197 short tons, valued at \$77,228, as against 9008 short tons, valued at \$81,769, in 1907.

*Mining engineer, 52 Broadway, New York.

The Distribution of Transvaal Gold

SPECIAL CORRESPONDENCE

In the February *Journal* of the Chemical, Metallurgical and Mining Society of South Africa there is an interesting paper on the above subject by T. Kirke Rose, of the Royal Mint, London. The years selected for analysis are 1905 to 1907, during which years South African gold amounted to 72, 71 and 75 per cent., respectively, of the total weight of gold imported into the United Kingdom.

For 1907 the figures were for gold imported into the United Kingdom:

	Oz. troy, gross.
British South Africa.....	8,012,437
British India.....	547,452
Australasia.....	893,901
Rest of the world.....	1,334,608
Total quantities.....	10,698,458
Total value.....	£39,556,304
Fineness of bullion, average,	879.2

The bullion on arrival in London is in part refined there, and in part reexported in an unrefined state. In the period 1903-7 Doctor Rose estimates the amount of imported bullion that was reexported without being refined at 15 per cent. of the total. Of the bullion imported into the United Kingdom a portion is retained in the country and a portion reexported without delay.

The imports and exports for 1907 and for four years were:

	1903-07.	1907.
Imports.....	£151,973,235	£39,556,304
Exports.....	98,059,568	26,589,442
Excess imports..	£53,913,667	£13,966,862

The greater portion of the gold retained in the United Kingdom is coined at the Royal Mint, the balance, which for the period 1903-7 is estimated at £6,361,300, being used in the arts, for the manufacture of jewelry, for gold plating, for the manufacture of gold leaf, in dentistry, photography, etc. The stock of bullion in the United Kingdom apart from the floating stocks held by refiners and bullion dealers, is in the vaults of the Bank of England. The Bank does not publish separate figures of the bullion and coin, but the two classes together amounted on Jan. 1, 1908, to £31,602,515. The bullion exported from the United Kingdom goes to the countries named in the following table:

Countries.	1903-07. oz. troy (gross)	1907. oz. troy (gross)
Continent of Europe..	13,065,963	2,021,501
(chiefly France and Germany)		
United States.....	6,063,671	3,143,700
British India.....	4,630,381	1,374,879
Rest of world.....	227,822	1,272
Total quantities..	23,927,837	6,541,402
Value.....	£98,059,568	£26,589,442
Average fineness of bullion.....	964.8	956.9

The gold ingots sent to America have varied in amount more than those ex-

ported elsewhere. From 1903-7 (the year of the panic) they increased steadily from 158,945 oz. to 3,143,700 oz. The mean for the five years 1903-7 amounted to over 10 per cent. of the gold deposited at the United States mints. Of this total quantity in the years 1903-6, about 55 per cent. was coined, about one-seventh was used in the industrial arts, and the remainder was added to stock or exported. According to the United States Mint reports, however, the ingots exported are almost invariably United States fine bars, practically never foreign ingots. Also more than 40 per cent. of the imported gold bars were issued for use in the industrial arts in the years 1903-5. This would leave nearly 60 per cent. of the imported bars to be divided between coinage and additions to stock of bullion in the United States mints and assay offices. This stock is subject to great fluctuations; it was \$124,083,823 on June 30, 1902, \$51,910,020 on June 30, 1905, and \$104,383,158 on June 30, 1906.

The paper concludes with a chart showing the disposal of the Transvaal gold in the period 1903-7: Used in coinage, 58.6 per cent.; used in industrial arts, 30.5; deposited as ingots in the Bank of France, 3.5; total, 92.6 per cent.; leaving 7.4 per cent. undetermined.

A Crude but Efficient Sample Grinder

By A. LIVINGSTONE OKE*

Junk heaps often contain much material that is useful, especially in remote mining camps, where supplies are not readily available. Some months ago, in view of the large amount of mine sampling and assaying to be done at La Gloria mine, Batopilas, Mex., it occurred to me to rig up a crushing roll and fine grinder to assist in the work. Fig. 1 shows the rolls which were made from two old vanner flywheels, and the bearings and adjustments from the side rods and brasses. The framing is of wood, as is also the hopper. The two driving pulleys are from disused vanners. This machine has put through over 2000 samples and is as good as ever. It cost 12 pesos to build. It is driven by two 3-in. belts at about 200 r.p.m. and is very powerful. Figs. 2 and 3 show the fine grinder with its pulp box attached and also removed for taking out the crushed sample. This consists of a heavy 3-in. shaft placed on end, with a flange above rotating at high speed below the upper swinging, but non rotating, flange.

The sample is poured into the center opening of the upper flange and is discharged around the edges as in other

disk machines. The upper flange is sufficiently heavy to prevent the pulp getting away until it is ground sufficiently fine. The pulp is received into a tin box, made in halves, hinged together, and entirely inclosing the two flanges. The upper flange is prevented from rotating by means of the wrought-iron yoke, fixed to the main upright at the back by a bolt passed through to form the fulcrum.

FIG. 1. IMPROVED CRUSHING ROLLS

FIG. 2. FINE GRINDER WITH PULP BOX IN PLACE

FIG. 3. FINE GRINDER WITH PULP BOX REMOVED

This yoke is also for lifting off the upper flange for cleaning between samples, and is also of use for putting extra pressure on the plates when necessary. The bottom foot-step bearing and also the upper one, were babitted in the wood and have given no trouble. This machine puts through about 50 samples a day, with a Mexican boy working it.

*Clarke's Alameda hotel, Mexico, D. F.

Dredging at Butte

By A. FLOYD BUSHNELL*

An interesting operation, the results of which will be watched with interest, is now in progress in the Butte district. It is the operation of the British Butte Mining Company's dredge which was built for the purpose of recovering gold from ground adjacent to the town of Rocker, four miles southwest of Butte. The dredge shown in the accompanying illustration, was started during January of this year, but the commercial results of the operations have not yet been announced.

The dredge was built by the Risdon Iron Works, of San Francisco, at a cost of about \$80,000, after the plans of Col. M. H. de Hora, president and manager

diagonal braces and four 12x20-in. posts; all the posts and braces extend to the foundation timbers on the bottom of the hull and are fastened to the same with steel plates and angles.

The main ladder which supports the digging buckets is a steel girder 68 ft. long between centers, 74 ft. overall, 3 ft. 8 in. wide, 54 in. deep in the center and tapering to 30 in. at the ends. The ladder is hung at the top to the main gantry by means of a 10-in. shaft, of 0.35 carbon steel and at the lower end is supported by rope blocks fitted with 36-in. cast steel sheaves with bronze bushings. The ladder rollers on which the bucket chain revolves are of manganese steel, 12 in. in diameter.

The upper tumbler which drives the buckets is a square of manganese steel with a shaft 11 in. in diameter running through it and fitted with renewable man-

The main power winch comprises six drums, the head line drum being of double width, running on a 7-in. shaft; the four side line drums run on 5¼-in. shafts; the other drum is for spare line. The ladder winch, which is used for hoisting and lowering the buckets, is separate and is direct connected with a variable speed induction motor, both being mounted on the same bed plate.

The revolving screen or trommel is 32 ft. long over all and is 78 in. in diameter at the upper end, tapering to 54 in. at the lower end. All the perforated plates are ¾ in. thick and perforated with ¾-in. tapered holes, 1¼-in. pitch. Both the screen and the gold-saving tables are Col. de Hora's design. There are 20 tables, 10 on each side of the revolving screen; each is 2 ft. 6 in. wide and the shortest 8 ft. 6 in. long. They are divided in the middle by a cast-iron mercury trough.

BRITISH-BUTTE MINING COMPANY'S DREDGE NEAR ROCKER, MONT.

of the company. The hull of the dredge is 110 ft. long by 50 ft. wide, and 7 ft. 6 in. deep, with rounded bows. The lumber used in the construction of the hull and dredge was Oregon fir and the sizes of the principal timbers are as follows: keelsons, 12 x 12 in.; side stringers, 4 x 16 in.; center stringers, 4 x 12 in.; center uprights, 6 x 6 in.; frames, 6 x 8 in.; diagonal bearing, 6 x 8 in.; bottom and side planking, 4 x 10 in.; deck planking, 4 x 10 in. The hull is caulked and tarred below the water line, and thoroughly water-tight.

The gantries are built of timber uprights 14x14 in. x 40 ft. long, capped by steel box girders made of channels and plates, the tumbler gantry being further supported by two 12x16 in.

manganese-steel wearing plates. The lower tumbler has a 10-in. shaft. The buckets are of 6-cu. ft. capacity, built of heavy steel with manganese lips. Every alternating bucket is fitted with four manganese steel teeth. The buckets weigh 1,500 lb. each, and the connecting links 500 lb. There are 37 links in the complete chain and the pins connecting the buckets and the links are of forged manganese steel 3¼-in. in diameter.

The stacker at the stern of the boat is made of 15-in. steel beams, and is capable of stacking the tailings to a height of 30 ft. above water at an angle of 30 degrees. It carries a string of close-connected steel buckets having steel links, bushed at both ends with manganese steel. The bucket belt is carried on cast-steel rollers, running in inclosed cast-iron bushings.

The tables are covered with cocoa mats and expanded metal, the ends of the matting being bound with brass cleats. All the fine material discharged from the screen is delivered on the tables by means of an inclined plate, fitted with an adjustable 18-in. feed roller having a length equal to the full width of the plate. The roller is driven in an opposite direction to the flow of the water at about one-half its velocity. Each table has an adjustable feed gate, and is also provided with a 1½-in. low-pressure water pipe. The tables are covered with heavy screen guards secured by Yale padlocks. The gravel from the tables discharges into side flumes, 2 ft. 6 in. wide, lined with angle iron riffles and fitted with a mercury trap at the lower end. The side flumes are so constructed that the fines can be discharged by means

*Butte, Mont.

of a centrifugal sand pump to the top of the tailings pile.

The water used on the dredge is obtained from the shaft on the property and is supplied by centrifugal pumps. An 8-in. pump driven by a separate motor discharges its water at a head of 50 ft. into the revolving screen; a 12-in. motor-driven pump supplies water at a head of 12 ft. to the feed rollers and gold saving tables.

The electric motors, of which there are nine on the dredge, are all of the induction type, 3-phase, 7200 alternations per minute, 60 cycles, 440 volts, and aggregate 300 horsepower. The dredge is electrically lighted and in cold weather is warmed throughout by radiators, the steam for which is supplied by a 40-h.p. Economic boiler. The wire ropes used are all flat-stranded crucible cast steel.

The constitution was framed by drafting what was deemed best from those of the technical societies in the United States, England and South Africa. There are to be three classes of members, namely, members, associates and honorary members. In order to be eligible for full membership, a candidate must be at least 25 years old, and must produce evidence of a good general and scientific education, regular training as a mining engineer or metallurgist, and engagement for a sufficient period in an important position of responsibility; or he must have had at least five years of practical mining and metallurgical experience. The annual dues are to be 20 pesos for members and 12 pesos for associates, besides which

Much good will toward the new organization has been expressed by the officials of the Government who are thrown into relations with the mining activities of the Republic, and also by such institutions as the Mexican Chamber of Mines.

Screening at the Utah Copper Mill

By H. B. LOWDEN*

As originally designed and equipped the mill of the Utah Copper Company at Garfield, Utah, contained trommels as the main screening equipment in the roll crushing department, the undersize passing over stationary inclined screens. Each of the twelve units comprised four trommels, 48x144 in., and two of the inclined flat screens, the trommels being clothed with rolled-slot wire cloth equivalent to about 6 mesh and the stationary screens with similar material passing a product equal to about 20 mesh.

Shortly after the first units were placed in commission, difficulties in the operation of trommels made themselves felt and more efficient and economical screening equipment was sought, to which end a number of devices were systematically tried on a large working scale. The results of these tests were so conclusively favorable to the impact screen that it was determined to equip the twelfth unit, at that time nearing completion, with these screens and to demonstrate conclusively the adaptability of the machine for the work. The twelfth unit was operated with decidedly improved results and with a capacity of 600 tons as against the 500-ton capacity of the other units, owing to the tables being able to handle a greater tonnage of the more closely sized feed. The screens in this unit were running wet.

The work of replacing all the screens throughout the other units of the mill was then determined on, and has proceeded as rapidly as possible without undue interference with operations. Sufficient time having now elapsed to permit of comparison between the two, the net result of the change can be summarized as follows: The capacity of each unit has been increased from 500 tons to 600 tons per day, the tables handling the increased feed by reason of its closer sizing; the saving of about one-fourth of the water used by the trommels is effected by running the four coarse impact screens, the crushing rolls and the elevator dry, this also increasing the life of the elevator by several months; the expense for screen cloth is also reduced, the cost of renewals being in the ratio of \$128 for the trommels to \$14 for the impact screens.

Farish, Geo. E.
Denny, G. A.
Thomas, Kirby
Bellwald, J. S.
Ordóñez, E.
Newcomb, C. S.
Brennon, J. H.

there is an initiation fee of 20 pesos for both members and associates. Meetings will be held monthly in the City of Mexico, besides which there will be district meetings in various parts of the Republic whenever there is a sufficient membership in the district to insure a successful meeting. The proceedings of the meetings are to be recorded in Spanish, but any member may make a motion or enter into discussion, or submit a paper either in Spanish or English, such motion or discussion or paper to be published in the proceedings in the language in which submitted, with an accompanying record or synopsis of the same in the other language.

The Organization Committee elected under date of April 13 a provisional council, composed of the following:

Thomas, Kirby
Babb, P. A.

Reynoso, J. J.
Denny, H. S.

A New Coal Washery in Michigan

The Coal Averages about 15 Per Cent. in Ash, and Contains a Quantity of Crystallized Pyrites, so that Specially Designed Methods Are Used

B Y L E E F R A S E R *

The Link-Belt Company, of Chicago, has recently completed a bituminous-coal washer, with a capacity of 100 tons per hour, for the Consolidated Coal Company, at Saginaw, Michigan.

The Consolidated Coal Company operates 9 mines, situated in both Saginaw and Bay counties, and produces 900,000 tons of coal per annum, 275,000 of which is slack coal. Conditions prevailing at the mines of the company make it impossible to deliver a uniform grade of slack coal, the ash percentage fluctuating between 3 and 40 per cent., and averaging about 15 per cent. But under the

first experienced in adjusting the Stewart jigs to make the best possible primary separation. There is a great difference in the character of the various coals to be washed, the coal not coming from one mine, but from nine. Coal from Saginaw county is uniformly heavier and more free of ash, while coal from Bay county is lighter and much heavier in ash, and contains, as a usual thing, a quantity of pyrites, which has often been found to have crystallized out into pieces as large as an egg. The adjustments, however, have been perfected to an extent where the loss of coal in the refuse is a mini-

Standard revolving feeders, and discharge into a primary battery of four Stewart jigs. Here a separation is made between the coal, with a specific gravity of 1.35 or less and the refuse, consisting of slate, pyrites, lime, sandstone, etc., or coal combined with any of these to an extent to make the specific gravity of the piece greater than 1.35.

The refuse runs directly from the jigs to a settling tank from which it is elevated at a speed of 30 buckets per min. by an elevator having a maximum capacity of 22.5 tons per hour. The washed coal is elevated from the main settling

The Engineering & Mining Journal, N. Y.

present operating conditions, 18 per cent. by weight of the raw coal is removed in washing, and the coal is separated into a nut size, passing over a 1-in. perforation, and a fine coal, both passing over and through a $\frac{3}{4}$ -in. perforation. The undersize from the $\frac{3}{4}$ -in. perforation is not blended directly with the oversize, but rewashed in Luhrig jigs, and then mixed with the oversize from the $\frac{3}{4}$ -in. screen. The resulting fine coal contains 5 per cent. ash, while the nut coal contains 2 per cent. ash.

Considerable difficulty, however, was

presented, the principal loss of coal being in pieces which have a specific gravity greater than 1.35 due to some attached slate or pyrites.

METHOD OF TREATMENT

The raw coal is unloaded with a gondola-car unloader, having a maximum capacity of 100 tons per hour, and is discharged into the raw-coal elevator conveyor, having a capacity of 240 tons per hour at a speed of 100 ft. per min., by which it is carried to the raw-coal bins, which are built to accommodate 150 tons of raw coal. The bins are provided with the Link-Belt "Spellman" bin gates and

tank, into which it is discharged by the primary jigs, by an elevator with a maximum capacity of 100 tons per hour at a speed of 33 buckets per min., and is then discharged into a double trommel for sizing. The inner shell of the trommel is of $\frac{5}{16}$ -in. steel plate, with 1-in. round perforations, 5 ft. at the small end and 7 ft. at the large end, and 14 ft. in length. The outer shell is of $\frac{3}{16}$ -in. steel plate, $\frac{3}{4}$ -in. round perforations, 7 ft. at the small end, 9 ft. at the large end and 13 ft. long. Here the coal is rinsed and sized.

The oversize from the inner shell is conducted directly to the washed nut bin. The oversize from the outer shell is taken

*Mining engineer, Saginaw, Michigan.

directly by the distributing conveyer to the fine-coal bins, while the undersize runs directly to the grading boxes for the Lührig jigs, and then to a battery of 5 Lührig fine-coal jigs. The refuse from the Lührig jigs runs into the refuse tank for the primary jigs and is elevated with the other refuse and conveyed to the dump. The fine coal recovered by the Lührigs is elevated from the secondary settling tank to the distributing conveyer, which has a maximum capacity of 90 tons per hour at a speed of 85 ft. per min. This conveyer handling both the oversize from the outer shell of the trommel and the fine coal recovered by the Lührig jigs insures a uniformly mixed fine coal in the bins.

The plant is also arranged so that the distributing conveyer for the washed coal will deliver to bins in front of the boiler. And further, raw coal may be received from the raw-coal elevator conveyer by the washed-coal distributing conveyer and delivered to the bins in front of the boilers.

The overflow from the main settling tank is kept circulating through the jigs and sluices by a 12-in. L. H. Morris double-suction centrifugal pump with a lift of 27 ft. at 320 r.p.m. Power is supplied by a pair of Corliss engines and all drives are of manila rope. Steam is generated in two 150-h.p. Wickes vertical steam boilers.

2. The coal dust on the down side of the timbers (and not on the up side) in the incline was charred and small stones had been shot up the incline and were to be found embedded in the timbers as if projected uphill and against the air current. Obviously the explosion traveled up this incline toward the spot where the shot had been fired. The inspector does not express an opinion on this point.

Both near the shot and near the boy, old roads, stowed with rubbish, communicated with old workings in the seam, recently full of water but unintentionally drained. Undoubtedly firedamp had accumulated in these old workings possibly generated through decomposition of timber, etc., and had been noticed.

The formation of firedamp in this way is well known, and two other similar cases have come to my knowledge. One was in

one of these, in which the horses were stabled nearby, an explosion occurred (fatal to all the horses) though it was virtually free from coal dust. In the other road which had an abundance of coal dust on floor, sides and roof, no inflammation occurred, but the force of the explosion was felt by men working in this road at a place a long distance inbye.

Some of the roads along which the explosion did progress were not dry and dusty. On the contrary, they were distinctly wet.

That coal dust plays a most important part in explosions is now universally recognized, but in view of the facts set out above it cannot be said to have been proved that the Norton Hill explosion was a dust—and nothing but a dust—explosion.

[In connection with the foregoing notes,

FLOW SHEET SHOWING GENERAL ARRANGEMENT OF THE COAL WASHERY

Notes on the Norton Hill Colliery Explosion

By H. M. MORGANS*

A recent report of Joseph Martin, inspector of mines for the southern district of Great Britain, deals with an explosion that took place at the Norton Hill colliery, Radstock, Somerset, England, in April, 1908. A perusal of the report shows that the inspector was from the outset inclined to exclude firedamp from having played a part in the explosion.

As the action of firedamp and coal dust in explosions is of such universal interest and importance, the evidence supporting the possibility of firedamp having been present may usefully be set out more fully than is done in the report.

The explosion was undoubtedly initiated by the firing of a shot part ways up an incline driven in a coal seam. The return air traveled down this incline. That the explosion did not start at the shot but at the bottom of the incline, where a boy with a naked light stood, is supported by the two following circumstances:

1. The explosion progressed in all directions from the boy as center.

*Engineer, Broad Street House, London, England.

a Somersetshire colliery where gas was fired near old workings without serious results—these workings having been drained only a short time previous, after having been filled with water for more than 80 years. The other was in a gold mine in India, where old workings which had long been filled with water were struck and gas was fired. Of course, it is well known that firedamp is often generated at the bottom of ponds.

The inspector reports that explosions could easily be obtained with the dust found in various places in the track of the explosion, but does not say if such explosions could be set up by a naked light, which was evidently what initiated the Norton Hill explosion.

The incandescent explosion gases rushing from the incline bottom to the down-cast shaft (up which they found vent after shattering the separation doors) passed the entrances of two roads—one on either side and nearly opposite each other. In

the following abstract of the official report on the Norton Hill explosion will be of interest: The accident occurred about 0.45 p.m., on Thursday, April 9, and caused the death of 10 persons who at that time were employed underground in the affected district. Some of the bodies showed the effect of severe burning, others of having been badly bruised by a considerable force, and others as if death was due simply to poisoning by carbon monoxide contained in the after-damp or fumes. There were also five horses killed in this explosion. The report states that the inquiry was a protracted one because the explosion had been attributed to gas instead of dust. The jury, however, did not accept this explanation of the owners, and in their verdict, stated that the explosion was due to the ignition of coal dust, caused by a shot fired by one of the miners. About 380 men and boys were employed at the colliery, but at the time of the explosion 30

only were underground working on the night shift. The inspector states in his report that the roadways were dry and dusty. It is also mentioned that a number of the managers of the Somersetshire collieries have considered the dust of these mines inexplosive, basing their belief on the report of the Royal Commission, which states that no explosion resulted from tests made on samples of dust received from the Somerset collieries. These collieries considered the necessity for watering, outside the considerations of practical mining in the Somersetshire coalfield. At the inquest an eminent analytical chemist was called in to prove whether the dust could be exploded. In the evidence submitted by this expert, he says that he tried to explode the dust by means of a naked light, a detonation, and firing a small cannon into it under varying conditions, and that although he obtained an ignition, he did not succeed in getting an explosion, so that he considered the dust nonexplosive. This same authority stated that he had several samples of air and a sample of water submitted to him for analysis, and that he found no trace of firedamp (CH_4) in any of the former, but that the latter—water which was given off from old workings—contained in solution 4.23 per cent. of gas by volume. The presence of this firedamp in the water indicated, as he explained, that changes and decomposition of organic matter were going on in this old goaf.

Disturbance of this so-charged water, he stated, might result in some of the gas being evolved. Referring to this evidence, the inspector states: "It appears to me, as it also did to most others versed in mining, who attended the inquest and followed the case, that since no trace of firedamp was found, or even thought at any time to have existed, during the present or former working of the mine, it is idle to suggest that firedamp could possibly have had any connection with the explosion."

EVIDENCE OF EXPERTS

The inspector also referred to the evidence of Thomas Morgans and George Batey, both experts, who voiced the opinion that the explosion was due to an accumulation of gas. Mr. Morgans attributed the explosion to an ignition of firedamp at the bottom of the Slyving Vein incline, and accounted for the presence of the gas in the mine by its having been given off from the water (from 8000 cu.yd. which had been contained in the 20-acre part of the old workings, and which had been unintentionally and unwittingly drained, between Feb. 6 and March 8, through the leader of a fault which was recently cut. Mr. Batey gave it as his opinion that the explosion was due to gas accumulated in a cavity in the roof of the incline on the higher side of the fault, being expelled by the concussion resulting from the shot, and that it

was ignited by a boy with a candle at the bottom of the incline. The inspector states that he does not consider either Mr. Morgans' or Mr. Batey's theory a true and practical explanation of the causes which brought about the accident, and further states that dust and not firedamp was the explosive agent operated upon by a shot which was fired about 40 yd. from the bottom of the Slyving Vein incline. Mr. Martin, the inspector, tells of his investigation as to the explosibility of the dust at the Norton Hill mine and gives his results as follows:

"1. The dust from the Slyving Vein's clean coal exploded violently. 2. The dust from the vicinity of the shot in the Slyving Vein incline exploded with violence, although not as violently as the clean coal. 3. Those samples taken from the upper part of the same incline and the intake road in the Middle vein exploded, respectively, with lower degrees of force."

Mr. Martin continues, "In making these tests or experiments, the point which struck me particularly was the small quantity of dust which was necessary, and indeed most effective in obtaining explosions. When a considerable quantity was present, it seemed as if it choked itself through want of oxygen, and that, although we obtained combustion in the tubes, it failed to explode. The results fully confirm the opinion I had formed, and having shown that at the point where the shot was fired, flame and dust were accounted for in a manner which can result in an explosion, it appears to me quite unnecessary to enter upon improbable theories to account for this explosion and its resultant effects. The shot, at the point indicated, was unanimously accepted as the starting point, whether, as suggested by Mr. Morgans, by creating a partial vacuum and sucking gas from the goaf, or by shaking the roof so as to cause it to sink or come down a small amount, or both, and thus expel gas, or by dislodging gas from the cavity in the roof of the incline, as suggested by Mr. Batey. The indications of the direction of force are also unanimously accepted, except in the length between the shot and the bottom of the incline."

ACTION OF THE SUSPECTED SHOT

In explaining the action of the suspected shot, Mr. Martin states further: "This shot hole, if the evidence is to be relied on, was only about 13 in. deep, but was in hard ground, and would consequently have had a fairly heavy charge apportioned to it in proportion to its depth, with a view of ripping the roof over as large an area of the road as possible. Owing, however, to a joint or slide at the right-hand side, which was, no doubt, previously unseen, the resistance was largely reduced, with the result that the hole was overcharged, the ground simply smashed down from a limited area,

and a considerable amount of flame at a high temperature was evolved, which ignited fine dust, lodged on the side and floor. This, when once started, would raise sufficient dust in the air from the floor, roof and sides to feed itself and carry the explosion forward as in other cases."

In closing his report, Mr. Martin states, "The effect of this experience will, I believe, be, not only to satisfy managers and others connected with Somersetshire collieries that they are not immune from the dangers of coal dust, but also still farther to impress the necessity of watering upon those who, having previously realized the danger, have shirked the trouble and expense of carrying it out. I have no doubt that, had there been even a small percentage of gas in the air, the damage and force of the explosion would have been greater and probably extended farther into the new vein."

It is evident from the foregoing notes, that English engineers differ as widely in their conclusions as to the initial cause and active agents in some of their explosions, as we in America. It is so probable that both dust and gas are active in all coal-mine explosions that it is often difficult to say definitely which agent is most to blame.—EDITOR.]

The Oxidation of Coal*

By O. BOUDOUARD

The study of the atmospheric alteration of coal has an important practical bearing in at least two directions. The spontaneous ignition of coal, with its occasional disastrous consequences, and the coking qualities of a coal. The work of Fayol and Mahler has shown that spontaneous combustion of coal is a direct result of oxidation of carbonic matter, while it is a matter of common knowledge that the percentage of volatile matter in a coal is not the only factor governing its coking qualities, and that of two samples of the same coal, the one that has been longer exposed to the atmosphere yields the poorer coke. Mahler thinks that a careful study of the behavior of coal when subjected to oxidation might shed light on the disputed question as to the relation between coal composition and coking qualities, and believes that the fundamental requirement of a good coking coal is that it shall contain certain carbohydrates, such as will be transformed into humic acids upon contact with air. Dennstedt and Bünz think that humic acids are the ultimate products of the decomposition of coal, and that those coals that yield the larger proportion of humic acids are the more susceptible to spontaneous ignition.

*Abstract of a paper presented to the Académie des Sciences.

As a contribution to our knowledge of this subject, I have made a series of comparative experiments on the following coals: I, English anthracite; II, one-fourth *gras* from Courrières; III, Belgian forge coal; IV, forge coal of unknown origin; V, three-fourths *gras* from Bruay; VI, coal of unknown origin; VII, lignite. The coals were analyzed by ordinary methods for fixed and volatile carbon and ash and the amount and quality of the coke yielded by heating in a closed crucible were noted. One set of samples was exposed to the air at ordinary temperature, and another at 100 deg. C. At ordinary temperatures the variations of weight, due to oxidation, were very slight, and might have been caused by changes in the hygroscopic state. At a temperature of 100 deg., on the contrary, after a diminution in weight due to loss of moisture, a distinct increase in weight took

place by treating a coal with some energetic oxidizing agent, like nitric acid. As soon as nitric acid is put in contact with a coal, a liberation of nitrous fumes takes place, which are the more abundant as the coal is richer in volatile matters; the reaction generates heat also in proportion to the percentage of volatile matters. Oxalic acid can be distinguished as one of the products of the reaction, and by leaching the oxidized coal with potash the presence of a relatively large percentage of humic acid can be demonstrated. After a treatment with nitric acid, samples III, IV and V had lost completely their ability to coke.

The treatment of coal by nitric acid must produce a number of unstable nitrous compounds, because the most careful heating, far below red heat, causes bubbling and a liberation of incombustible vapors. The variation in the weight of coals thus

Round Mountain Mining Company

The annual meeting of stockholders was held at Goldfield, Nev., April 19, and the following directors were elected: L. D. Gordon, Thomas Keane, W. H. Bryant, James R. Davis, president and general manager, and J. P. Loftus, vice-president. W. E. Johnson was elected treasurer and H. G. Mayer, secretary and assistant treasurer.

The manager's report states that the development work done for the year ending March 31, 1909, was 6775 ft. The main incline shaft was sunk during the year a distance of 196 ft. making a total depth of 783 ft. and four new levels opened, the 500, 550, 600 and 700. These levels were driven a total distance of 281 ft., 567 ft., 497 ft. and 254 ft. respectively.

From the main shaft 29,582 tons of ore were extracted during the year and 31,962 tons blocked out ready for stoping.

During the year the company milled 29,582 tons of ore, producing a total of \$349,505 and a net profit of \$169,839. The cost per ton of ore mined and milled has been reduced from \$7.06 to \$6.07 per ton. The company has let contracts for additional mill machinery, air compressor, air-drill equipment, 50-h.p. hoist and motors, and has entered into contract with the Nevada-California Power Company by which the power costs will be reduced approximately 20 per cent., and by the use of the new equipment mining and milling costs should be reduced from 15 to 25 per cent. During the year the company paid \$127,901 in dividends.

Vanadium in Peru

By S. JOCHAMOWITZ

Particular interest attaches to the rare minerals of Peru, of which vanadium is becoming of importance. This mineral was found in the vicinity of Sierra de Pasco by A. R. Patron, engineer of the Huaraucaca smelter. The mineral is a sulphide of vanadium, and was given the name patronite from its discoverer. It occurs in veins, some of which reached a width of 15 ft.; the outcrops have been traced for several hundred feet. Shortly after the discovery (November, 1905) a company was organized for the purpose of mining the deposits. Regular shipments are now being made to the United States. The quantity exported during 1908 was over 600,000 lb. The ore is handled mostly by the American Vanadium Company, by whom it is converted into ferro-vanadium at Pittsburg. The mineral is of a relatively low specific gravity and has a dark color and green streak. In addition to vanadium, the ore contains some molybdenic oxide, silica, alumina, iron and sulphur, and is believed to be a mixture rather than a chemical combination.

place, amounting in some cases to 10 per cent. Other tests at the same temperature on larger quantities of coal gave similar results.

ACTION OF THE HUMIC ACID

Humic acid, the presence of which was determined by leaching the coal with potash and precipitating with hydrochloric acid, was present in the original coal only in sample VI (less than 1 per cent.) and sample VII (5 per cent.); after exposure to the air at 100 deg., humic acid was distinctly present in samples III and IV (trace), V (5 per cent.), VI (14 per cent.) and VII (1 per cent.). At the same time, the coking qualities of samples III, IV and V, which in their natural state yielded a firm, compact coke, had entirely disappeared. It would seem, therefore, that there is some relation between the absence of humic acid and the coking qualities of a coal.

The increases of weight due to oxidation can be much more forcibly demon-

strated by treating a coal with some energetic oxidizing agent, like nitric acid. As soon as nitric acid is put in contact with a coal, a liberation of nitrous fumes takes place, which are the more abundant as the coal is richer in volatile matters; the reaction generates heat also in proportion to the percentage of volatile matters. Oxalic acid can be distinguished as one of the products of the reaction, and by leaching the oxidized coal with potash the presence of a relatively large percentage of humic acid can be demonstrated. After a treatment with nitric acid, samples III, IV and V had lost completely their ability to coke.

The total production of all kinds of cement in the United States during 1908, according to U. S. Geological Survey figures, was 52,775,925 bbl., valued at \$44,376,656. This output was divided as follows: Portland cement, 51,002,612 bbl., \$43,472,679; natural cement, 621,862 bbl., \$808,500; slag cement, 151,451 bbl., \$95,468. There was a heavy decrease of production in most of the Eastern and Southern States. The average price of the entire portland-cement output in 1908 was only 85c per bbl., 30c below the average price in 1907.

Topographic Engineering

By W. D. BLACKBURN*

It is the purpose of this article to place before the readers of the JOURNAL, with especial reference to engineers and those in charge of geologic and mining work, a few of the many facts in relation to the field of topographic engineering insofar as I am able.

GEOLOGIC

The mining geologist does not depend alone upon the underground work of a mining property; in fact, it forms a small part of the data from which he draws conclusions and makes recommendations. It is in connection with the geological features of the surface that the nicer questions of formation and mineral possibilities arise, and here it is that the topographic map is of such advantage and importance that it is an absolute necessity for any other than the most general and indefinite work.

With a topographic map in hand showing the relief of the country with accuracy, and points of especial geologic, topographic and cultural interest plotted upon it, the geologist is enabled to place upon the map with absolute correctness the boundaries of the different formations and other geologic features, so that he has before him a complete geologic picture of the country, together with the topography, the whole forming a graphic expression of information from which conclusions can be drawn easily, quickly and correctly. Not only does the map show the area in plan, but it has within it the information and data necessary to the construction of innumerable sections. Sections can be constructed at any point, or for any distance, and for this reason any part of the area can be shown with its reference to the surface profile. By combining a survey of the mine workings with the topo-geologic sheet it is possible to obtain more and clearer information concerning the relation of the workings and surface than can be secured and expressed by any other method of survey and mapping.

MINING

But it is not for the mining geologist alone that the topographic map has interest, or is of value. To the men engaged in mining and particularly in development work a map of this nature should prove of inestimable service. For the purpose of illustrating this, two cases will be discussed.

Case 1. A mine in process of development has a tunnel driven a certain distance, and it is desired to make a connection with the surface for the purpose of ventilation and to better facilitate the ex-

traction of the ore, the work to be prosecuted simultaneously as a raise from the tunnel and as a shaft from the surface. The usual method would be to run: (a) A transit line from the point in the tunnel at which the connection is desired to the surface point immediately overlying; (b) a line of levels between the two points; and (c) to compute the lines thus run and, finally, to plot the results. The work may even then have only a negative value so far as the present demand is concerned, for the surface point may be, to say the least, disadvantageous as a location for shaft purposes. It is unnecessary to dwell upon the time, patience and labor required to obtain this information. Those who have had experience therein know the fact too well to require that special attention be called to it. Let us see if a topographic map combined with an underground survey would help in the solution of the problem. The map has definitely located surface points plotted upon it and also the underground workings drawn to the same scale. It is obvious that any point in the workings has its relative surface point in plain view upon the map. We may choose the most suitable point for the shaft at any time while development is in progress, and we already know, from the map, its approximate location. To determine its exact location we have recourse to the nearest or most accessible definite point, and by measurement therefrom and the determination of the course from the coordinates of the map we are able to go into the field and fix the point upon the ground with certainty. We can note from the contours the respective elevations of the tunnel mouth and the surface point just determined and, by subtraction, arrive at the depth of shaft required and make the necessary calculations as to time required for sinking and cost. By the expenditure of an hour's time we can construct a profile along the line of the tunnel and the overlying surface and we have all the information necessary to this particular connection. Further, we have all information necessary to any other connection which may be desired along this line within the limits of the topographic sheet.

Case 2. Development has been in progress at two different points within the boundaries of a group of claims. These points are widely separated both vertically and in plan. It is desired to make a connection between them by means of a third opening which will, at the same time, develop new ground. The surveys and maps necessary to the correct solution of this problem would entail a great deal of time and labor and still be subject to the same criticism as the work done in case 1; that is, it would be of negative value only. I do not wish to be understood by the use of the term "negative value" as meaning that whole work is useless. The point I desire to make is, that if the work determines that the place fixed

by the survey is disadvantageous, another point will have to be determined before the work of making the connection can be begun. The chief objection to the usual method of obtaining the necessary data for connections of this sort is the time and labor it entails in the matter of field work, computation and mapping. It is not an unusual thing to make several surveys before the final result is that striven for.

With a topographic map of the same description as used in case 1 spread before us, we can see at a glance the relations of the workings between themselves and the surface overlying them as well as that adjoining; we can determine the best point for the location of the new working with the view of accomplishing the most in every possible way; and we can decide upon the future progress of the underground headings both as to distance and direction. This can all be done without an hour's field work with no reference to notes, and with absolute knowledge that the best method has been chosen from every possible one open. The projection of the workings first, with reference to points within themselves; second, in reference to each other; and finally, with reference to the surface, will place before us, in connection with the plan map, all the information necessary to a correct estimate of the time and cost of the connection, since from the two we obtain, not only distance and direction and relative elevations, but also information concerning the form of opening best suited to the work and the formation of the ground topographically and geographically.

OTHER CASES

These are only two of the many cases which are continually presenting themselves for adjustment to those who are engaged in mining, cases where it is difficult to determine the best method of procedure under all circumstances and where a map of the kind we are discussing would be invaluable in placing all the data in a clear and accurate form before the man who has to decide such questions. Among the many other examples which might be brought forward in this connection are those relating to railroad and tramway construction and the collection of data necessary to the computation of cut and fill, bridge and trestle work, location of towers, etc. Oftentimes it becomes necessary to know the topography of the country surrounding a mine in order to obtain data with reference to the construction of pipe lines, canals, or conduits. It is necessary to emphasize the value a good topographic map would have in the solution of problems of this class where the thing most desired is a means of arriving at a decision after all possibilities have been considered. There is nothing that will take the place of a graphic method of expressing information, and it is this that the topographic map possesses in the fullest sense and largest degree.

*Topographic engineer with Spurr & Cox, Inc., Apart. 2707, Mexico.

Surface Trials in Rand Stope Drill Competition

Twenty Machines in the Contest, Fourteen Qualifying for Preliminary Underground Test; Piston Drills Leading, Hammer Drills Close Second

BY EUSTACE M. WESTON

The stope-drill competition, held under the auspices of the Transvaal government and the Transvaal Chamber of Mines, has been completed as far as the elimination surface trials are concerned. Three-day underground trials are now being held and the machines which survive these will be given 300 shifts of continuous underground work, two machines of each class being kept at work. Generally speaking, the final award is to go to the machine that succeeds in drilling the greatest footage at the least cost for labor, repairs, motive power, supplies, etc. The first prize is \$20,000 and the second, \$5000. The air pressures supplied will vary from 60 to 80 lb. at the end of the pipe line.

The entries for this widely advertised contest numbered 20, including machines from the Transvaal, England, Germany and Scotland. From America only two entries were received, the Murphy and the Waugh. Neither the Ingersoll-Rand nor the Sullivan companies were represented. Locally-designed drills were much in evidence. In the results given, which are taken from the official reports, air consumption is calculated per linear foot drilled and in cubic inches per minute. The consumption per foot drilled cannot be taken as an accurate standard of comparison, as some machines, particularly the Anderson, used larger sized steel and bored a larger hole than others. The only regulation in this respect was that holes should be from 42 to 48 inches deep and to be of 15/16-in. diameter at the bottom. However, most of the drills used bits of, approximately, the same diameter, so the comparison is valuable, if not exact.

THE WEIGHT LIMIT

Perhaps the most important regulation in connection with the competition was that the drills should not weigh more than 100 pounds and should, if possible, weigh less. A modern American drill manufacturer or miner would at once conclude that hammer drills were the only drills which would have any chance in such a contest. I have, however, in a former article, pointed out that conditions in this field are very different from those in most American mining districts. Stopes are inclined about 30 deg. to the horizon on the average, and where small machines are used, are from 30 to 50 in. high. The ground is very hard in most cases. A bar and clamp must always be

used and 95 per cent. of the holes are down holes drilled with water.

I, therefore, expressed the opinion that despite the theoretical advantages possessed by hammer drills, a suitably modified piston drill stood a good chance of holding its own for such work. Hammer drills had to work with hollow steel injecting air and water, or air or water alone into the hole. They had to be provided with some sort of cradle with automatic air or screw feed, and thus abandon much of their great advantage of portability, as when used for boring uppers with air feed alone. Similar conditions occur in the North Star mine, Grass Valley, Cal., and there the 2 1/4-in. piston drill thus far holds its own. The Gordon drill had shown that it was possible to make a very light hammer-drill machine giving a large output of boring power per unit of weight, but its failure under the rough working conditions of the Transvaal with its unskilled black laborer and much inferior white labor, showed that improvements were needed in both the design and the material used in the construction of such a type of machine.

CHANGES IN DESIGN OF PISTON DRILLS

Makers of piston drills on the other hand had to combine large output of power (in order to compete in boring speed with hammer drills) with the light weight required by the conditions of the trial. Obviously some features of the standard designs had to be sacrificed. Weight was generally economized by shortening the stroke, by shortening the piston and cylinder and by cutting down the weight of valve box, valve and cradle to the minimum. All these changes make, of course, for increased maintenance costs owing to greater wear and tear and a smaller margin of strength to provide against breakage. We have, therefore, two tendencies, one to produce a simplified and stronger hammer drill, the other to reduce the weight and increase the boring speed of piston drills. The results from the surface trials are, therefore, interesting, and in some cases, surprising.

THE COMPETING DRILLS

The machines entering the competition were as follows:

(1) Holman drill. Made by Holman Bros., Cornwall; a piston drill, cylinder diameter, 2 1/8 in.; stroke, about 5 in.; weight, 90 lb.; spool valve with auxiliary ball valves; rotation, automatic.

(2) Bantam drill. A locally-designed

piston drill; cylinder, 2 in. in diameter; stroke, 5 in.; tappet-moved valve; weight, 82 1/2 lb.; automatic rotation.

(3) New Century drill.

(4) De Fries drill. Both these drills were of the light hand-hammer class, weighing about 40 lb., and having no clamp or cradle. The De Fries lacked sufficient boring power; neither were suitable for the conditions of work in this field, having no arm, bar or clamp, or forward feed.

(5) Ross Patent drill. This is also a hammer drill, the design of which appeared quite unsuitable for the work.

(6) Anderson drill. Locally designed, but made in Scotland; a piston drill having a 3-in. cylinder, 5-in. stroke, with air-thrown valve having a regulating device to make up for wear. The machine was also designed for use with water passing down the piston rod, through the hollow steel; automatic rotation.

(7) Vlotmann drill. A well-known German make that has been largely used in coal and metal mining in Europe. Hammer drill; weight, 78 3/4 lb.; cylinder diameter, 2 1/2 in.; stroke, 3 3/4 in.; weight of hammer, about 4 lb.; blows per minute, about 1000; valve motion is of the oscillating ball type and rotation is automatic, the hammer carrying a rifle bar; hollow shell with water injection is used; feed was by hand screw and the cradle could be moved forward or back on the clamp.

(8) Westfalia. Another German hammer drill; diameter of cylinder, 2 3/4 in.; weight, 65 lb. The feed is automatic by an arrangement of two pawls on a ratchet bar. This device is not novel, as supposed, being adapted from an early design of tunnel drill described in Guttman's work on blasting. This machine used a spray and exhausted air down hollow steel. It bored very rapidly, but it seemed doubtful to me if the pawl arrangement would wear well, and if the machine is not too light for its energy output.

(9) Keymer drill. This hammer drill was withdrawn.

(10) New Century OO piston drill. This, with the New Century hammer drill previously mentioned, is a locally invented drill. The spool valve is of novel design; cylinder, 2 5/8 in. in diameter; stroke, 6 in.; weight, 92 3/4 pounds.

(11) Climax Imperial. Hammer drill, made by Stephens & Sons, Cornwall. This drill I have already described in a special article. It is a powerful long-

stroke hammer drill with automatic feed specially designed for work in this field.

(12) Holman 2¾-in. piston drill. Similar in design to the 2½-in. drill, and to the Chersen drill.

(13) Murphy drill. Hammer drill of the type well known in America; a valveless machine using hollow steel with a water feed from a detachable clamp attached to drills. Its performance against machines of the valve-moved type with afvil block, such as the Waugh, Vlottman and Climax Imperial, is interesting.

(14) The Konomax stope drill. A piston drill of local design; 2-in. cylinder; 4-in. stroke; weight, 91¾ lb.; feed, entirely automatic. This machine is valveless and gives diagrams of air consumption resembling those of a first-class engine showing the air to be used expansively.

(15) Holgate piston drill. Cylinder diameter, 3½ in.; stroke, 4 in. This was

sent feature. The machine is mounted on a swivel cradle so that it "follows the steel" when boring and does not hold it rigid.

(18) Meyer-Fullerton. A hammer drill using hollow steel with air injection; appeared deficient in boring power.

(19) All Steel drill. Piston drill of insufficient power.

(20) Chersen. A piston drill of 2¾-in. diameter; 6-in. stroke; oscillating valves. This drill performed well in the trials organized by the "South African Mines," and has already proved itself a reliable machine, there being upward of 200 at work in this field; ordinary solid steel is employed.

The arrangements for holding the trial were good. Granite blocks, 3½x3½x5 ft. were set in a solid bed of concrete. Bars were solidly erected and connected by rail bolts and clamped to the concrete. Water connections were provided and air was supplied, being carefully measured

possible to build a 100-lb. piston drill to outdrill a 100-lb. hammer drill the answer would have been decidedly in the negative. I do not expect this drill to survive the 6-month trial, but its success confirms my expressed opinion that the ideal piston drill is one using hollow steel with water injection and that its efficiency would approach or surpass that of any hammer drill.

The German hammer drills stand second and fourth in the list, but I do not expect the Westfalia to survive to the finish. The Chersen drill comes third, and this drill, I think, will come very near winning the competition. The Climax Imperial hammer drill stands fifth. This machine should be well up among the hammer drills at the end. The Murphy valveless hammer drill working without an anvil block stands ninth, beating the Waugh, which stands fourteenth. The interesting Konomax, the baby of piston drills, with only a 2-in. piston and a short

*These have been eliminated as a result of the surface trials. *First trial. *Second trial. (a) Used either a dipper or a jet from main provided by the committee. (b) Jet through steel. (c) Separate spray from main. (d) Jet and air through steel.

a locally designed and manufactured machine and, though it bored up to a rate of 5½ in. per min., it broke down several times, owing to being constructed of unsuitable material.

(16) Siskol. A piston drill using hollow steel and a water jet; water lead in through back of machine and through the piston rod to the drill bit. This machine was a rapid driller, but there was evidence that troubles would manifest themselves underground.

(17) Waugh drill. A hammer drill, manufactured in Denver, Colo. It has, like the Murphy, a rear-cylinder piston air feed and the steel is rotated or oscillated by hand. Air and water are injected down hollow steel. The machine has a hollow cylindrical short-stroke piston valve set at the rear of the cylinder. Vanadium steel is used for the anvil block, and it is claimed that reliability and freedom from breakdown is a promi-

through a Kennedy air meter, calibrated by Professor Orr, of the Transvaal University College. M. W. Wood acted as manager and the arrangements gave every competitor satisfaction. The accompanying table, taken from the *South African Mining Journal*, gives the results in a tabulated form.

THE QUALIFYING DRILLS

The Holman, 2½ and 2¾ in., the Vlottman, Westfalia, New Century OO, Climax Imperial, Murphy, Konomax, Holgate, Siskol, Waugh, Meyer-Fullerton and Chersen drills successfully passed the test of drilling 1 in. per min. and are entered for a further 3-day elimination trial underground. It will be noted that the Siskol piston drill had the best average speed of drilling of all competitors. This is somewhat curious in view of the statements made by certain American manufacturers. Had they been asked if it were

4-in. stroke, drilled faster than the Waugh. The two American machines are, however, strong and simple and will, I think, last through the trial.

AIR CONSUMPTION

In air consumption, the Konomax leads easily with only 29.6 cu.ft. per minute. The Murphy is second with 40.6, beating the Waugh with 53.0. The Siskol stands third with only 50.6. The Chersen is higher, 81.8 cu.ft., but this is not high for a 2¾-in. piston drill. The air consumption per foot drilled is not an exact comparison, but here again a piston drill leads, the Konomax using only 144.4 cu.ft. The Murphy hammer drill, by also using air expansively on the forward stroke, is a good second with 169.75 cu.ft. The Chersen uses 239.9, the Vlottman 193.1, the Climax Imperial 235.6, the Siskol 206.35 cubic feet.

CONCLUSIONS

Generally, it may be said that piston drills have more than held their own, while the valveless type of hammer drills has done well. Personally, I fancy the piston drills will last out the underground trials better, especially if their owners are farsighted enough to supply plenty of spares to keep them efficient, but there are several hammer drills in which most of the sources of weakness of this type have been carefully eliminated, and it is quite possible that the winner may be found in such a drill as the Murphy or the Climax Imperial.

The efficiency of the piston drills will tend to fall as soon as the chucks wear and the drill is not held truly, and as the pistons, cylinders and valves wear, air consumption will increase. Competitors are, however, allowed to repair machines, cost of such repairs being charged against them, and a bold policy in this respect will meet its own reward. Hammer drills may suffer from water leakage, cylinder wear, breakage of hammers and anvils, and must stand the extra expense of hollow steel, water hose and connections. Whatever the result may be, much will have been learned of the greatest value for future designers.

Fuller's Earth

Fuller's earth is an aluminum silicate containing more combined water than most clays; its chemical composition varies with its origin, and is of no value in the matter of determining the commercial qualities of a given sample. The properties and uses of fuller's earth are the subject of an extended article in *La Revue de Chimie Industrielle* which states that while the most common colors are brown and gray, it also occurs white, yellow, pale red, and even black. Its specific gravity ranges from 1.75 to 2.50. The earth will sometimes disintegrate when put under water, but more frequently a piece of it will hold its original shape. Certain earths are hard, like rocks. The best fuller's earths come from Dorset, Kent and Surrey counties, England.

When analyzed by the methods applied to rocks, some fuller's earths show a strongly acid reaction, although entirely free from acids. This apparent acidity arises from its absorptive qualities, and is directly proportional to its power of absorbing such bases as lime; it is not, however, at all proportional to its decolorizing power on oils. The apparent acidity varies from nothing up to the point at which 1.50 per cent. of oxide of lime is required to neutralize it.

DECOLORIZING AND OXIDIZING POWER

Fuller's earths from certain localities have the unfortunate effect of giving to edible oils a rancid flavor, by oxidation,

and this power is directly proportional to the absorbing capacity of such earth. Earths which possess this character to a high degree can be treated with lime-water, to counteract the apparent acidity, but at the same time their decolorizing power will be diminished; it is for this reason that earths high in lime are not good decolorizers. If the above treatment be limited to the partial neutralization of the acidity, the odorizing effect of the earth will be reduced while its decolorizing power will not be entirely lost.

When an earth of high apparent acidity is subjected, under water, to a strong electric current, the particles appear to be negatively charged, and move slowly toward the positive pole; this probably explains the fact that such earths give an acid filtrate after agitation with salt water, and the power of such an earth to remove the nitrogenous colors from an oil, exactly as would be done by a true acid.

Some earths possess a very active oxidizing power on oils; the oxidation is sometimes so violent that the cakes removed from a filter press, after treatment of an oil, will burst into flames from spontaneous combustion as soon as they reach the air. This event is most often noticed when working with rapid-drying oils.

The decolorizing power of fuller's earth has never been perfectly explained; some think that it is a chemical reaction, while others believe it to be purely mechanical. Cameron's experiments seem to indicate that it is merely an absorption, and that it takes place more rapidly in an oil than in a water solution. Practically all the coloring matter taken out of an oil by a fuller's earth can be recovered from the earth by alcohol, provided that the adherent oil is first removed by treatment with ether or benzene. This combined treatment will restore the decolorizing power of a used earth almost completely.

TREATMENT OF MINERAL OILS

The decolorizing of mineral oils is conducted in a different way, and with a different quality of earth, than that applied to animal and vegetable oils. For mineral oils, the Florida fuller's earths seem better than the English, and even an important amount of lime is no detriment. The operation is similar to that of clarifying sugar solutions by boneblack, consisting in allowing the oil to filter through a bed of fuller's earth. The first oil to come through will be almost colorless; thereafter it comes through less and less clear, until the filter bed becomes saturated with coloring matter and will absorb no more. The spent earth can then be regenerated by calcining in a rotary furnace; the high temperature to which it is subjected here does not seem to diminish its decolorizing power on mineral oils, though it does with animal and vege-

table oils. The fineness of the earth should be adapted to the nature of the oil to be treated; heavy and viscous oils require the earth to be in coarse grains, while with a light oil, the earth can be ground to 200 mesh and over.

ANIMAL AND VEGETABLE OILS

The method of decolorizing animal and vegetable oils is to heat the oil in a receptacle containing a coil of steam pipe; add the necessary amount of fuller's earth; stir for two or three minutes, and conduct the mixture to a filter press to recover the earth and liberate the oil. The temperature varies according to the nature of the oil and the kind of product desired, but ranges around 100 deg. Centigrade. A lower temperature is often used.

The amount of earth required also depends upon the nature of the oil, and even for different lots of an oil of the same general nature, different amounts of earth will be required to yield a product of the desired whiteness. Lard oil generally requires 1 per cent., by weight, of fuller's earth, cottonseed oil requires 5 per cent., while tallows need very large proportions. The oil refiner selects his stocks of crude material so as to demand the least possible amount of fuller's earth to decolorize it, since he will thus not only economize in the consumption of earth, but will also lose less oil by adherence to the earth.

A Packingless Pump

The abolition of packing between the pump piston or plunger and the cylinder bore is proposed in the arrangement shown in the accompanying illustration. It is a suction and force pump with two concentric cylinders, *A* and *B*, with a cer-

The Engineering & Mining Journal, N. Y.

PACKINGLESS PUMP

tain amount of annular space between them, and each of which is closed at the lower end by a ball valve. In this construction it is intended that the liquid pumped shall play the part of packing between the two cylinders. The pump is especially intended for handling such liquids as muddy or sandy water or petroleum. It is the invention of Mark Pollatschek, of Bukarest.

In 1908 there were produced in the United States, according to statistics collected for THE MINERAL INDUSTRY, 1,149,000 lb. of bromine (\$103,410) against 1,002,000 lb. (\$138,000) in 1907.

New Method of Extracting Oil from Boreholes

The Principal Feature of the System Is an Endless Cable Covered with Absorbent Material and Operated from a Drum at the Surface

BY FREDERICK A. TALBOTT*

An interesting development in the petroleum industry among the oilfields of Galicia has been effected recently the results of which have been so successful that the principle is being extended throughout this oil-bearing area. Owing to the remote situation of these fields, the lack of highly-skilled labor, and the uncertain yield from the boreholes, the erection and operation of the usual types of pumping plant is attended with numerous difficulties. Repeated efforts have been made to devise simple systems for the extraction of the crude oil from the deep and narrow pits, easily, quickly, and cheaply, in order to suit the local conditions, but the success achieved has been only partial and commercially impracticable for all-round working. As a result of a prolonged investigation of the problem an entirely new system has been devised by Herr Bruno Leinweber, an engineer of Vienna, prolonged tests with which under the most exacting conditions have proved eminently satisfactory. It offers an inexpensive and easy means of extracting the oil from the boreholes and should prove eminently adapted for operation upon oilfields which from their remote situation and other conditions cannot be exploited in the usual manner at a profit. Though primarily devised for oil wells, it is equally applicable to the haulage of any fluids or even semi-fluids such as water and saline solutions thickly impregnated with organic matter.

THE LEINWEBER SYSTEM

Briefly, the system comprises an endless band or cable, covered on one side with an absorbing material, such as carpet shag, which is of sufficient length to become immersed at its lowest extremity in the liquid in the borehole. As the band travels through the liquid a certain proportion of the fluid becomes absorbed by the covering of the cable which, upon arrival at the surface, is passed between two rollers. These press out the liquid, which can either be caught in suitable vessels or, if the pit is merely being drained, deviated into conduits and thus led away. The plant at the mouth of the borehole comprises a timber staging carrying a drum around which the cable passes, and by means of which it is driven either by hand or other power, guide pulleys to lead the upward and downward traveling sections of the rope

to and from the well, and the pressing rollers. It will thus be seen that the apparatus is of simple design and construction. Having few integral parts, it is not easily liable to breakdown.

THE FIRST PLANT

The first plant was constructed for operation in the Kryg oilfield of the Galician-Carpathian Petroleum Company, the engineer and directors of which, impressed by the possibilities of the system, placed several of their boreholes at the disposal of the inventor for the purpose of practical experiment and demonstration. The plant was built in the railroad shops at Reichenberg, Bohemia, and was packed,

923 ft. and before despatch to the oilfields the band was severely tested, the ascending part being loaded to the extent of 2200 lb. in excess of the estimated weight of 550 lb., which it would have to withstand in actual use. This was done in order to test not only the cable, but the effect and stresses upon the winding jack which in this instance would have to be hand driven. It was found that the band traveled more smoothly and evenly when saturated with liquid than the descending dry section, since it secured a better adhesion upon the surface of the winding drum. The winding sheave worked steadily and without any accompanying slip or jerk.

FIRST TEST OF THE SYSTEM

The borehole first selected was near Maryampolski and was 1881 ft. in depth. Only the upper part, however, was in a proper condition for work and this had a diameter of 9 in. Before the band was let down it was stretched out on the ground for measurement and preliminary preparations. Owing to the severity of the weather prevailing at the time of the trials the carpet shag became clogged with snow and was frozen hard when it was lowered into the borehole. Under these circumstances descent had to be made slowly and carefully, the lowering operation, after the two ends had been spliced together to secure an endless band, occupying 1.5 hours. The band was not cleaned, being lowered in its snow-clogged and frozen state, yet it was observed despite these unpropitious conditions to descend vertically and without touching the sides of the borehole. Moreover, as steam drive was unavailable winding had to be carried out by hand, so that a speed of only 0.66 ft. per second could be attained.

HEADSHEAVE OF LEINWEBER EQUIPMENT FOR SHALLOW WELL

mounted on two channel-frames, with the band properly adjusted, so that it could be erected immediately upon arrival at the oilfields.

In this plant the traveling cable was manufactured especially to suit the prevailing conditions. It was of rectangular construction, being 3.1496 in. wide by 0.31496 in. thick, made of hemp and tested to withstand a strain of 9240 lb. The carpet shag with which the outer face of the cable was covered was 2.3622 in. wide by 0.7874 in. thick and for the purposes of experiment three different kinds were attached to the traveling cable which was of hemp in three sections, the idea being to ascertain which class of shag possessed the greatest absorbent and yielding qualities. The whole was designed for working to a depth of

Owing to the condition of the carpet shag covering the cable it was some time before it attained its maximum absorbing capacity. The oil containing a large proportion of paraffin, owing to the low temperature prevailing, was of the consistency of fruit jelly. Notwithstanding these adverse conditions, the plant worked smoothly. The average yield obtained at the pressing rollers was found to be 4.13 oz. per foot of cable. This yield might have been increased had the rollers been fitted with skimmers to secure the oil which was brought up on the sides of the cable, and which by descending into the borehole, was lost. Fur-

*13 Wilbury Crescent, Hove, Sussex, Eng.

thermore, owing to the band being fitted with three different qualities of shag the yield varied, since one section was found to be particularly deficient in absorption. With the band traveling at about 5 in. per sec., an oil barrel was filled in 50 min. When, however, the shag became more pliable and a speed of 3.3 ft. per sec. was attained a yield of over 4000 lb. per hour was obtained. At the conclusion of this test the plant was dismantled and reerected at another borehole 1716 ft. in depth, where it is still in service.

INSTALLATION AT BORYSLAW

The preliminary tests having been considered successful, the construction of other plants was commenced for various pits on the oilfield. The inventor, in the first of these which has been erected at Boryslaw, was able to carry out certain modifications in the cable and shag which the experiments at Kryg had demonstrated as being advisable. The pit at which it is in operation is of great depth, the band working down to 2640 ft. The oil is thick and impregnated with from 7 to 8 per cent. of paraffin. The gases are sufficiently rich to cause the well to spout every alternate day when the yield is about 11,000 lb. per day. The cable is of steel wire of rectangular section, about 2 in. wide by 0.157 in. thick, covered with a long-haired pile on the outer surface, 0.78 in. thick. The cable has a breaking strain of 11,176 pounds.

The pit-mouth installation is similar to that erected at Kryg, the hand cranks simply being replaced by a pulley to take the driving belt of the steam engine. When the plant was started it was only found possible to attain a maximum speed of 9.25 ft. per sec., since the steam engine was not sufficiently powerful to drive faster. The average speed, however, was 4 ft. per sec., at which velocity the band yielded 4500 lb. of oil per hour. In this instance also the yield could have been increased if oil-strippers had been provided to secure the contents carried on the sides of the cable, but they were omitted in order to render all parts of the band and machinery accessible and under free observation. It was found that the weight of the ascending oil-laden section of the band was 2024 lb. and that of the descending dry section 1044 pounds.

Unfortunately in this instance the capacity of the plant proved too large for the flowing capacity of the well. Consequently, owing to the oil level in the pit decreasing so rapidly as to interfere seriously with the efficiency of the apparatus the latter was dismantled and transported to another well.

MODIFICATION OF THE SYSTEM

Another installation is being made for the same fields, but a new system will be adopted for the surface plant. It is to

work to a depth of 3960 ft. The band will be of the same type and dimensions as that used in the above-described Boryslaw installation. The pit-mouth apparatus will consist simply of a driving disk of large diameter around which the endless cable will run together with a pulley guide and a pressing roller. The experience gained at Boryslaw proved that although the existing plant is simple in design and working it might be made still simpler with corresponding advantages. The inventor will, as a matter of fact, revert to the system he first evolved in the course of his model experiments, the principle of which is shown in the accompanying illustration of a small plant working to depth ranging from 100 to 130 ft., constructed especially for the Technical High School at Karlsruhe, Germany. In this it will be seen that the driving sheave comprises a narrow wheel carrying two

can be easily repaired should an accident occur. When in operation no attendance is required beyond the charging of the lubrication cups on the bearings.

The two sections of the band, before one part becomes soaked, balance each other so that the driving effort required is only that necessary to deal with the weight of the material being raised and the slight frictional losses. The band can be kept in a constant state of repair and efficiency. Should a stretch of the shag become worn, it is necessary only to remove the defective part and sew on another piece, it not being necessary to withdraw the band from the borehole for this purpose. When it is desired to remove the band, the splicing is simply released and one end made fast to the winding sheave or paid out and coiled as the drum brings it up.

The system is flexible and the traveling

LEINWEBER OIL EXTRACTION EQUIPMENT AT KRYG, AUSTRIA

or three winds of the rope. It is mounted upon a small frame, the ascending section of the band passing through the pressing rollers mounted immediately below the axis of the driving wheel. This arrangement certainly possesses the advantages of being much simpler, while it occupies much less space and is more readily accessible. The plant devised in accordance with this principle will be utilized in connection with boreholes having depths of 4125, 4412 and 4468 ft., respectively.

ADAPTABILITY AND REPAIR OF THE PLANT

The efficiency of the system and its suitability to such conditions as prevail in the Carpathian oilfields, has been proved. The distance of the field from the industrial centers renders a breakdown a serious matter, since some time must unavoidably elapse before it is possible to secure duplicate parts or repairs. On the other hand, the Leinweber plant

speed and consequently the yield can be controlled within a wide range; similarly the dimensions of the shag can be increased or decreased as occasion requires. The system is especially suitable to those boreholes which are not carried down vertically since there is always a certain tension between the drum and the lower bend in the band due to the weight of the absorbed material, while experience has proved that none or very little loss in yield arises from the band striking the side of the borehole. Should the band encounter any obstruction in its course a safety clutch can be fitted to the winding sheave to bring the machine to a stop and thus avoid any breakage of the traveling band. In the event of the oil containing water, the liquid upon exuding from the pressing rolls can be separated, while similarly should the oil be combined with sandy material the latter can be removed by a water jet or steam flush.

May 15, 1909.

Although the exploitation of the invention has hitherto been confined to the Carpathian oilfields, its operation has been inspected by several engineers to whom its simplicity and immunity from breakdown has appealed. Arrangements are now being concluded for its development in other parts of the world where local conditions are not suitable to the utilization of the generally adopted facilities for such work.

Occurrence of Auriferous and Stanniferous Tourmaline in Sumatra

By L. HUNDESHAGEN*

Some years ago I noted a peculiar rock consisting entirely of small rounded grains of quartz and cemented by talc about 2 to 3 km. to the southwest of Moeara Sipongi (residency of Tapanodi, west coast of Sumatra) and in other localities of the neighborhood.

The rock carried small quantities of dark yellow gold and has occasionally been mined for gold by Malays. It rests on granites and is from 30 to 100 m. thick, being in places overlaid by more or less metamorphosed sandstone which consists mainly of quartz and feldspars and is in places intersected by diabasic dikes and sills. The capping of quartz-talc rock is probably a metamorphosed granite. It appears that a similar rock has not yet been mentioned as occurring in other parts of the world.

As regards the gold, it is not accompanied by sulphides, but it incrusts occasionally a blue-black nonmagnetic iron mineral not yet exactly determined. In the zone of quartz and talc, more especially where near diabasic rock, occur pockets and irregular masses of almost pure black tourmaline free of sulphides and with traces or no limonite. The magnetic segregations of crystallized tourmaline assay from 2 to 10 dwt. gold and a little silver, part of which is susceptible of amalgamation. Though the tourmaline is in places 2 ft. thick, it is not certain whether it can be profitably mined. Boulders of tourmaline, which mineral, as is well known, is very characteristic of the stanniferous deposits at the Straits Settlements and elsewhere, were found in 1901 by the government mining engineer about 30 to 40 km. northeast and east of Loebou Sikaping (Uplands of Sumatra) where stream tin is being won by the Malays. Though this tourmaline, when finely crushed, rarely pans cassiterite, it at times assays, according to his report, appreciable quantities of tin, viz., a small per cent., and exceptionally even up to 10 per cent.

Dredging Conditions in Colombia

By A. P. ROGERS*

Colombia offers today several attractive features for gold-dredging operations, although the drawbacks should be well understood before anyone attempts to invest his money there. I spent several months upon a thorough examination, which resulted favorably, of a piece of land in that country and as far as I know, it is the first expedition ever sent down there that has drilled the ground in the systematic manner that such work is done in California and other established fields. The successful operation of a dredge upon this land will be watched with much interest, and it is bound to prove a stimulus to other similar projects within a short time, when the work of equipment has been completed and the extraction of the gold has actually begun.

The conditions under which one must work are radically different from those found in the United States. This land is all situated within 10 deg. of the equator, and most of it is at an elevation above sea level which is considered unfavorable to health in that latitude. The climate is tropical in every sense of the word, while the heavy and violent rainstorms during the wet season—lasting nearly nine months of the year—turn the flat areas, suitable for dredging, into veritable swamps which breed the malaria-infected mosquito by the million. To guard against these pests requires a strong constitution and a sane manner of living, which the Northern man is loathe to adopt until he has gone through the mill.

A tropical jungle that is exceedingly dense and a cause of much annoyance must be cleared off most of the land. It must be understood that this country is very sparsely populated, and practically the only means of travel is by the large navigable rivers, or over frightfully rough and uncertain trails, blazed through long stretches of impenetrable wilds. Small settlements exist at intervals along the rivers, but behind them there is always the jungle until another river is reached. As a consequence, the traveler must carry his own camp equipment and food supplies upon any journey he intends to make into the interior, and a plentiful supply of netting to keep away the insects at night.

The gold content of the ground is often high enough to prove very attractive for dredge mining, especially when it is taken into consideration that you can work throughout the year with no fear of an interruption due to cold weather. The only thing one must guard against is the chance of a heavy flood, if the dredge is working on a river. Such an occurrence is liable to happen at any time during the

wet season, and occasionally during the dry season, with great rapidity, and produce startling results. For this reason, it is preferable to work inland a short distance, where it is possible.

The gravel usually contains a small percentage of clay, but in most places this is not so much of a hindrance as the lack of uniform values. It is the usual thing for the owners to claim phenomenal values throughout their land, which must always be taken with a grain of salt. Rich spots are quite common, but their extent is usually rather limited, and one must discount these statements when a large area is figured on. There are so many rivers in this region flowing down from the upper Andes, that sufficient water power can be developed in numerous places for all the dredges that are ever likely to be installed, although one may have to go some distance from his ground to find the most suitable location for a power house.

The conditions under which the men must live are very trying in some respects. A Northerner going there for the first time should exercise the same precautions he would take if he lived in a swampy region here at home during very warm weather. All houses should be built off the ground upon some hilltop, have high ceilings with a double roof, and wide verandas. By clearing away the jungle from about the house, the warm sun will dry things up and a chance will be given to any breeze that may spring up. The soil over these low areas is exceedingly rich and fertile, so that a large variety of vegetables can be raised at your very door, while cattle seem to thrive. To prepare the food, an imported cook is a necessity, as the native knows nothing about this important art. To keep good men contented in such a country nothing pays better than to set an attractive table.

The government of Colombia is now considered fairly stable and it is anxious to help all legitimate mining enterprises as much as possible. There is an export tax of 1 per cent. upon all gold exported from the country, but mining machinery is practically free from duty. As far as labor goes, it is fairly efficient, for the wages that are paid. The peon is much like a small child and will work to the best of his ability, if treated properly. Probably the most difficult problem to solve for a foreign company, operating in this field, will be to secure the services of an efficient and honest corps of our countrymen to keep things going. It is a long way from home and the average man is apt to get homesick, if not really sick, and then his principal thought is how to get back North with the least possible delay. This condition of things necessitates a reserve corps to fall back on when the occasion arises. In spite of the drawbacks, I look to see considerable capital invested in dredging enterprises in Colombia within the next few years.

Improvements in the Treatment of Slime by the Vacuum Filter Process

BY ARTHUR W. ALLEN*

The idea of simultaneous displacement of pulp with wash solution in the working of a suspended-leaf type of vacuum filter was formulated and put into practice by me at the Palmarejo & Mexican Goldfields Company's slime plant at Zapote, Mexico, some months ago. The success that has resulted has given rise to the following description of what would be the most satisfactory type of installation on this system.

CHART OF OPERATIONS FOR VACUUM FILTER PROCESS.

Time.	Compartment No. 1.	Compartment No. 2.	Compartment No. 3.
1:55	Solution into No. 2.	Pulp into No. 3.	CHARGE 64
2:05	Replaced by water.	Replaced by solution from No. 1.	
2:15	Vacuum off.		Pulp agitated with pump.
2:20			Vacuum on.
2:25	Cake discharged.		
2:30	Gate closed.		
2:35	CHARGE 65.	Solution into No. 3.	Pulp into No. 1.
2:45		Replaced by water.	Replaced by solution from No. 2.
2:55	Pulp agitated with pump.	Vacuum off.	
3:00	Vacuum on.		
3:05		Cake discharged.	
3:10		Gate closed.	
3:15	Pulp into No. 2.	CHARGE 66.	Solution into No. 1.
3:25	Replaced by solution from No. 1.		Replaced by water.
3:35		Pulp agitated with pump.	Vacuum off.
3:40		Vacuum on.	
3:45			Cake discharged.
3:50			Gate closed.
3:55	Solution into No. 2.	Pulp into No. 3.	CHARGE 67.

DIAGRAM OF FILTER SHOWING CONNECTIONS FOR SIMULTANEOUS DISPLACEMENT METHOD OF SLIME TREATMENT

The attached plans are diagrammatic and, for the sake of clearness, the water and vacuum pump connections have been omitted. The filter box consists of three separate compartments each having a discharge door and each containing an equal number of filter leaves. These latter are connected with a vacuum pump in the usual way and arrangements are made so that the vacuum in any particular compartment may be lowered or shut off.

There are two systems of pumps. The one, which is used for pumping pulp from the bottom of either of the compartments into the top of either of the others, is also connected with the main agitation or storage vats. The other, for solution, is connected with the compartments in a similar way on the other side of the filter, and also with the solution pumps. Both the solution and pulp are delivered over the full width of the compartment by means of perforated canvas hose.

The cycle of operations is as follows:

The first compartment is filled with pulp and, when ready, the vacuum is applied to the leaves and maintained until sufficient cake is formed. The vacuum is then lowered to a few inches and the pumps are started, the pulp being pumped into the second compartment and replaced at the same time with solution from the third. While the washing is being continued in the first compartment the vacuum is opened to the leaves in the second. When the cake is formed on the latter the pulp is pumped into the third compartment and is replaced by solution at the same time from the first compartment, the latter in its turn being filled with water. As soon as sufficient of this has been drawn into the cake to displace the solution the vacuum is shut off and the slimes are discharged. The gate is then closed and the compartment is ready for the pulp from the third compartment.

The accompanying chart is a complete section of a working sheet and will give some idea of the time taken by the va-

rious operations and the economy effected in this direction.

The advantages of the system are: (1) Large tonnage handled in a minimum time. (2) Minimum pumping. (3) Even deposition of sandy matter in cake as a result of top delivery of pulp. (4) Absence of necessity of removal of loaded leaves during operations with consequent jarring of the frames and cake. (5) No drying or exposure of the cake to the air and in consequence no disarrangement of what might be called the molecular deposition of slime particles on the leaf, the practical result of which is a perfect wash in a minimum of time and with the aid of a few inches of vacuum only.

The Custom House returns published in the *Vestnik Finanssoff* (*Chem. Trade Journ.*, April 17, 1909) gives the exports of cement from Russia during 1908 as 1,006,000 poods, valued at 405,000 rubles, as compared with 4,417,000 poods, valued at 1,701,000 rubles in 1907.

*Metallurgist, Chihuahua, Chihuahua, Mex.

A West African Gold Mine

SPECIAL CORRESPONDENCE

The report of Prestea, Block A, for the year ended Dec. 31, 1908 will be of interest not only to the shareholders, but to a wider circle who invested in West African mines during the recent boom on the expectation that under new management and with new methods, great improvements would be brought about in the financial results. On examining the report and accounts of the Prestea Block A Company it is evident that the improvement expected has not yet been realized. During the year 1908 the ore milled was 89,933 tons from which gold to the value of £154,763 or 34s. 5d. per ton was recovered. During 1907 the tonnage crushed was 78,164 tons yielding £195,837 or 50s. per ton. There has consequently been a great falling off in the grade of ore milled. An examination of the working costs is equally unfavorable. In spite of the fact that to more stamps were running in 1908 than in 1907 and that a reduction in the grade of somewhere about 30 per cent. was made, changes which might by themselves be expected to make a considerable reduction in the costs quite apart from the benefit of improved management, the costs, if compared carefully, do not reveal any marked improvement. The figures given in the reports for the two years are as follows:

	1907.		1908.	
Tons milled	78,164		89,933	
Stamps	50		60	
	Cost per Ton Milled.		Cost per Ton Milled.	
Mining	16s.	3.44d.	17s.	4.64d.
Milling	11s.	3.1d.	10s.	5.57d.
General exp. mine	3s.	11.8d.	3s.	1.34d.
Development	2s.	11.3d.	1s.	1.11d.
General exp. London	1s.	8.2d.	1s.	2.16d.
Depreciation			2s.	7.51d.
Total	37s.	1.8d.	35s.	10.33d.

In the 1907 accounts no charge was made for depreciation and if this item is, for purposes of comparison, deducted from the 1908 figures, the net result shows a reduction in 1908 over 1907 of about 4s. per ton. This is worth having, but it appears to be a fictitious rather than a real improvement, as about 3s. of it is obtained under the heading of development. No doubt the reduction in grade must have reduced automatically the cost of development per ton, but it appears questionable whether the charge made of 1s. 1d. in the 1908 statement of costs is a fair one, especially when the balance sheet shows mine development standing at £182,770 for ore reserves of 270,500 tons or a cost of over 13s. per ton. While no great improvement in the working costs is as yet visible, notwithstanding the great reduction in grade, it is fair to point out that the alterations of plant are not yet complete and that next year's returns may have a more favorable appearance.

New ore-bins and crusher stations are in course of erection, as well as a suction gas plant. Before the close of this year it is hoped to be able to treat 14,000 tons per month. It is anticipated too that in the near future the branch railway connecting the mine with Tarkwa will be completed, and that will enable the work to be carried on more economically than at present. In the mine no sinking has been done during the year owing to trouble with water, but new electric pumps are being installed and it is the intention to sink during this year a further 300 ft. vertically in order to open up a sixth and seventh level. At the same time the eastern section of the property will be developed through the new incline shaft. The developments have been of a satisfactory nature, the ore reserves blocked out on March 31, 1909, being 270,500 tons of a value of 11.6 dwt. The company has already contracted a loan of £35,000 and further funds will be required for the equipment of the property and for development of the mine, so that the shareholders may have to wait some time before the dividend-paying stage is reached.

Fires in the Geological Survey Building

SPECIAL CORRESPONDENCE

A fire which occurred on the fourth floor of the Geological Survey building, in Washington, early on May 9, and resulted in the destruction of one of the laboratories of the Survey with a loss of at least several thousand dollars, has again directed attention to the unusual risk the Government is running in keeping records, valued at more than \$5,000,000 in a building that is not fireproof. While the Survey officials estimate \$5,000,000 as the value of these records, their destruction by fire would mean a total loss of \$10,000,000, as the Government has already spent \$5,000,000 in obtaining them, and it would be necessary to spend a like amount to replace them, and even then, certain records could not be duplicated under any circumstances.

The fire which was kept from spreading to the remainder of the building, owing to its discovery by an outside watchman and the prompt work of the firemen, is the third that has occurred in this building within the last six years. On Dec. 27, 1903, fire started on the sixth floor in the night time, destroying Government property to the extent of \$10,200. On Dec. 16, 1908, another fire in the night on the fifth floor resulted in a loss of \$15,810. In both instances, the presence of Survey officials, in addition to that of the night watchman, contributed to the prompt extinguishment of the fires with comparatively small losses.

Shortly after the second fire, James R. Garfield, then Secretary of the Interior Department, sent a communication to Congress, urging an appropriation of \$2,500,000 for a fireproof building to be occupied by the Survey, the General Land Office, and the office of Indian affairs.

On April 19, of this year, Senator Gugenheim, of Colorado, presented a bill providing for the erection of a building to be used exclusively by the Geological Survey, the cost not to exceed \$1,100,000. This bill is still pending. Survey officials believe that even before a fireproof building can be erected for the general use of the Survey, some small fireproof building should be provided at once for the various laboratories, as these are generally supposed to be the danger spots in the present building.

It is said that the fire in the laboratory on May 9 was caused by spontaneous combustion.

Esperanza

SPECIAL CORRESPONDENCE

The English company holds 449,800 shares out of a total of 450,000 shares in the American Esperanza Mining Company, so that the two companies are practically identical. The property is situated at El Oro, Mexico, and has up to the end of 1908 given a production of 49,114,860 pesos (Mexican currency) from the treatment of 1,176,117 metric tons dry weight. During the year 1908 the mine produced 145,451 dry metric tons of ore, having a gross value of \$2,146,290 (U. S. currency), from which a net operating profit of \$927,616 was obtained. The average yield per dry metric ton was \$14.75 as compared with \$20.63 in 1907. The operating costs for the year amounted to \$8.48 per ton, which is approximately 17 per cent. lower than the costs in 1907. Considerable additions in the shape of tube mills, Pachuca tanks and Merrill filter-presses are being made to the mill and it is expected that the new improvements will be started in July, 1909; and that increased mill recoveries and reduced operating costs will result. A paragraph in the report that requires some explanation is that which says that the improved milling scheme, as compared with present practice, will increase operating profits by \$1,000,000 by reduction of operating cost and increased mill recoveries for mine ores and recovery of values from dumps. It is not clear what tonnage this refers to and whether or not it is allowed for in the estimated operating profit from the ore reserves mentioned above, namely \$2,117,222. The report is accompanied by an admirable set of plans together with full statistics of the metallurgical work.

Colliery Notes

Never fire a shot in a hole containing a cavity or break; there is a possibility of firedamp being present in the cavity, and if charged and fired, it may lead to disaster.

In firing shots, separate examinations for gas should be made after each hole has been fired. The position of all holes should be marked previous to firing, so that in case of a missfire, the relieving hole can be placed in a proper position.

According to the latest information, the Canadian-Northwestern coalfield contains over 45,000,000,000 tons of marketable coal. The product of this field, especially in the Fernie district, produces a good quality of coke, which, with improved methods of manufacturing, will equal the coke produced in many American fields.

It is interesting to observe that, although coal-cutting machines were introduced in Great Britain 50 years ago, in 1902 there were only 166 machines used in that country, while in 1907 there were 1493. In the United States in the year 1906, there were 10,212 machines in use, and the percentage of the total coal mined by machinery was more than 30 per cent. Each machine used in the United States showed an average annual production of 11,638 tons, which compares with 8630 tons in Great Britain.

Notwithstanding that public opinion is to the contrary, pit ponies in most districts are well treated. Although the animals fret for a few days when first consigned to the lower regions, they soon regain their natural gaiety and spirit. The ponies are regularly fed three times a day and groomed twice. Their feet and general physical condition are carefully looked after and attended to by experienced farriers. At all well-regulated mines, any cruelty to ponies on the part of the boys who work them is speedily punished. At many English collieries, an admirable plan is adopted, whereby the driver boys are encouraged to attend their ponies properly by the distribution of substantial rewards.

Some attention was attracted in one of the English coalfields, by the withdrawal of a pit pony from active service in a mine, after having been underground continuously for nearly 20 years. When the little animal was brought to the surface, he was stone blind, but otherwise in remarkably good condition. As is the custom at this colliery, the animal was killed, because there was no old-age pension awaiting him. In this and other adjacent mines, it is stated that many of the ponies are employed continuously underground for from 15 to 20 years without seeing daylight. It seems that after so many years of faithful service, mine owners should be able to devise some means for

providing for these animals, even though (as it is claimed), the ponies are now painlessly despatched.

One important reason for regarding a mine's atmosphere containing blackdamp with suspicion, is the effect this mixture has on the miner's ability to detect firedamp, should this latter gas also be present. It is well known that the detection of firedamp is affected by the presence of blackdamp, and it is, therefore, important that a strict observance of a fixed blackdamp standard should be adhered to. It is a matter of common knowledge that in some instances, it is possible to have a mixture of blackdamp and firedamp, lighter than air and settling up in the roof. When a lamp is put into such a mixture, the light is immediately extinguished without any indication of firedamp. At such a point, the blackdamp renders the firedamp inexplosive, but if the mixture is given more oxygen, an explosive atmosphere soon exists.

The longwall system of mining is becoming more and more used in Continental coal mines. European engineers contend that longwall mining reduces mineral losses to a minimum, and affords better facilities for the application of mechanical power; this latter assertion is based on the fact that the longwall system presents a continuous working face, extending several hundred yards in length, which simplifies the working of a mining machine, to the one operation of undercutting the exposed seam, subsequently admitting of its easy cleavage by hand. It is also asserted that the longwall system as used in Europe lends itself to a more expeditious transit of the mineral by means of coal conveyers, since temporary tracks are readily laid along the entire length of the working face, and the coal is often broken down into the waiting receivers, effecting a net saving of from 12 to 15c. per ton on all coal brought to the surface under such conditions.

It is a question of dispute as to what percentage of firedamp, when present in mine air, justifies the withdrawal of the men working underground. At a majority of the collieries on the Continent the miners are withdrawn when 2 per cent. of firedamp is found. Regarding a standard as to contamination of the air with blackdamp, about the only sensible practice is to limit this standard to a condition where the lamp becomes dim. When such a decrease in the lighting power occurs, it is then time to withdraw all men. This standard should, therefore, be placed at about one per cent. of CO₂ and not less than 10 per cent. of oxygen. Every miner should always be able to rely on his lamp, and when this latter goes dim, it should be an immediate signal for exit. When blackdamp is present and a miner does not heed the decrease in lighting power of his lamp, it is certain that such an atmosphere will soon dull the

miner's senses, and will make him less alive to the ordinary precautions respecting his own safety.

One of the important points brought out at a recent meeting of coal-mining men was with reference to the general tendency of attributing most of the recent mine explosions to coal dust as the destructive agent. A number of engineers now claim that the coal-dust theory is being brought in to explain explosions that are due to gas. Attention was called to the fact that in a number of recent cases, the miners, evidently realizing that something had gone wrong in the mine, were trying to escape by rushing to man-holes when a second explosion occurred and killed them. First of all, there was an explosion caused, probably, by the firing of a shot, and a second explosion, accompanied by the production of a partial vacuum, ensued after a short interval. The general opinion was, that the second explosion was due to gas and was more disastrous than the first. One investigator called attention to experiments made in a gallery of boilers, where the real damage was caused by a detonation where there was an open end to the gallery, only three boiler lengths away. In explaining the results of this experiment the speaker said that when the first explosion had taken place, carbon monoxide was left behind, and in this particular instance, the carbon monoxide was detonated.

It is not advisable to place too much reliance on the safety resulting from watering a coal mine. In an examination of various collieries on the Continent where the practice of sprinkling was carried on, it was found that after an explosion, several districts of a wet character contained the largest quantities of charred dust. In this connection, it may be stated that it is necessary in sprinkling underground, to consider carefully what degree of saturated air a miner can stand. This latter point remains a matter of dispute, for some engineers claim that if the air is dry, a miner can stand 90 deg., while other authorities assert that a man cannot work in 87 deg. of saturated air without injury. Mr. Ashworth, in a recent lecture, argued that to use water effectively as a preventive of explosions, there must be 5 per cent. of vapor present in the air, and that this amount could only be obtained by means of steam. Mr. Ashworth continued by saying, that to get any safeguard in a mine from water, the men must be prepared to work in steam. He suggested that the superintendents make their roads right and the mines sanitary, giving the men as dry air to work in as possible, and never mind watering. This objection to watering on the part of Mr. Ashworth is rather unexpected, in view of the favor that has lately attended the practice of sprinkling.

THE ENGINEERING AND MINING JOURNAL

Issued Weekly by the

Hill Publishing Company

JOHN A. HILL, Pres. and Treas. ROBERT MCKEAN, Sec'y.
505 Pearl St., New York.

London Office: 6 Boulevard Street, London, E. C., Eng.
CABLE ADDRESS "ENGINEERING, N. Y."

Subscription, payable in advance, \$5.00 a year of 52 numbers, including postage in the United States, Mexico, Cuba, Porto Rico, Hawaii or the Philippines, \$6.50 in Canada.

To foreign Countries, including postage, \$5.00 or its equivalent, 33 shillings; 33 marks; or 40 francs.

Notice to discontinue should be written to the New York office in every instance.

Advertising copy should reach New York office by Thursday, a week before date of issue.

For sale by all newscasters generally.

Entered at New York Post Office as mail matter of the second class.

CIRCULATION STATEMENT

During 1908 we printed and circulated 507,500 copies of THE ENGINEERING AND MINING JOURNAL.

Our circulation for April, 1909, was 43,000 copies.

May 1..... 12,000
May 8..... 10,000
May 15..... 10,000

None sent free regularly, no back numbers. Figures are live, net circulation.

The Price for Copper in 1908

As in previous years we summarize herewith the reports of the Lake Superior copper-mining companies as to the amount of copper sold by them in 1908, the receipts for the same and the average price realized. The list is practically complete for Lake Superior with the exception of the Calumet & Hecla, which does not report its average price. All of the other Lake Superior companies are characterized by the fullness of detail that they communicate to their stockholders.

From the reports for 1908 it appears that the various Lake companies realized a remarkable uniformity of price, the averages of the majority falling between 13.3 and 13.4c. per lb. As in 1907 the Quincy realized the highest average. It is to be remarked, however, that the Quincy figure includes the net proceeds of the silver separated, which is not itemized in the report for that company. Aside from that the high price for the Quincy copper is easily explained by its exceptionally high quality and large number of steady customers who buy it without much regard to the competitive offering of other brands of copper. The low average received by the Victoria may be explained by the small amount of its sales, the bulk of which may have been effected during a period of the year when the price for copper was lower than the average.

Speaking generally, 1908 was nearly a normal year, i.e., there was a steady sale for copper throughout the 12 months. Consequently, as is usually the case, under normal conditions, the average actually realized by the producers came very close to the quotational average of the ENGINEERING AND MINING JOURNAL. Fifteen Michigan companies sold 125,949,248 lb. of copper for \$16,907,498, an average of 13.348c. per lb. The average of our daily quotations was 13.424c. per lb. Comparison for a series of years is made in an accompanying table.

In 1906 and 1907 the producers fell far short of realizing the quotational average. This was because the conditions in those years were so distinctly exceptional. A repetition of them, or anything nearly like them, may not be seen in another 20 years. In 1906, the price for copper was boosted to the extraordinary figure of 26c. per pound. The latter part of the rise oc-

AVERAGE PRICE REALIZED FOR LAKE COPPER.

Year.	Sales Reported.	Price Per Lb.	Quotation.
1905.....	82,372,955	15.97	15.699
1906.....	113,411,645	19.146	19.616
1907.....	66,316,025	18.043	20.661
1908.....	125,949,248	13.348	13.424

curred on comparatively small sales which the producers, having disposed of the larger part of their output lower down, failed to realize extensively, wherefore they were outstripped by the quotational average. On the other hand in the precipitous decline of the second half of 1907 the quotations were again established by comparatively small sales and the producers were unable to effect large transactions until the market was near the bottom. In normal years like 1905 and 1908 the weighted average and the quotational average agree very closely.

The Cost of Silver Lead Smelting

In the JOURNAL of Aug. 15, 1908, we published an article which aimed to show by scientific deduction what is the average profit realized per ton of ore smelted by the American Smelting and Refining Company, a figure that it has always carefully kept out of its official reports. In that article it was deduced that the total profit in the year ending April 30, 1903, was a little less than \$2.20 per ton, and the opinion was expressed that the profit in smelting alone, properly considered, at that time might have been about \$2 per ton. Since then the company has thrown some light upon the subject. In a recent statement to the New York Stock Exchange it said that the average amount of ore smelted is 3,500,000 tons per annum,

which alone does not afford the basis for any precise calculation. However, the latter is obtained in the statement by Mr. Brush, of the company, before the Ways and Means Committee, Dec. 16, 1908, that in the fiscal year ended April 30, 1908, the company smelted 3,372,750 tons of ore. The net profit in that year was \$7,011,191. Consequently the total profit per ton of ore was a little less than \$2.08. The actual smelting profit was, of course, something less, because the company realizes more or less from its various ventures that are not to be referred directly to its smelting business. Mr. Brush, in his testimony, several times mentioned \$1.50 per ton of ore as being the profit in smelting, in which he may, in speaking offhand, have somewhat underrated the figure. However, the evidence is quite sufficient to prove the accuracy of the deductions that were made in the article in the JOURNAL above referred to.

The Smelting Company and its officers now having told so much, we see no reason why hereafter it should not incorporate a specific statement upon this point in each of its annual reports. We are sure that such a statement would be appreciated both by the stockholders of the company, who are fully entitled to such information, and to the producers of ore with whom the company does business. The stockholders would have a better line upon the position of the company than they can unravel from pages of mysterious figures, while the mine owners would be satisfied that the company is not exacting from them smelting charges that are exorbitant and unreasonable.

The Geological Survey Has Another Fire

The following is a recent newspaper despatch:

"Washington, May 9. For the second time within three months fire threatened with destruction today the building in which the Geological Survey is housed. The blaze was discovered early this morning, and after a sharp fight was extinguished, not, however, until the chemical laboratory was destroyed. It is not known how the fire originated, but it is practically certain that crossed electric wires were the cause of the trouble, as they were of the blaze three months ago. Valuable maps and charts stored in the building

were again damaged by water. The frequency of these fires will be taken as an argument for a Government building for the Geological Survey. The building it now occupies is rented, and is a fire trap. In the case of a sweeping fire the Government would lose a vast amount invested in data and much of it could not be replaced."

We have repeatedly urged Congress to eliminate this danger by providing the Geological Survey with an adequate building. Inasmuch as it appears unwilling to do so, we recommend that the President by executive order transfer the Survey and its archives to Fortress Munroe, or some other safe place that the Government may happen to own.

The Copper Statistics

The report of the Copper Producers Association for April is of a nature to excite mixed feelings. The production was 3,785,810 lb. per day, against 3,776,000 in March. Obviously the curtailment of production by the high-cost producers has not yet offset the increase by such important districts as Ely, Cananea and Cerro de Pasco, which can operate at a profit on the recent level of price. This is an argument against the chances for a striking and permanent advance in price, which would cause production rapidly to increase still farther. On the other hand, it is certainly a source for congratulation that the deliveries for consumption in April gained so materially that the addition to the surplus was only a trifle more than 900,000 pounds.

In commenting upon the statistics for March, we remarked that "It would not be surprising if the production of refined copper should show a decrease in April and if the accumulated stock would begin to wane." Neither forecast was actually realized, but the tendency in both directions was so clearly manifested by the April statistics, combined with the fact that the monthly addition to the surplus has been steadily diminishing since February, that a distinctly favorable impression was created.

STATISTICS FOR MARCH AND APRIL

	March.	April.
Production	117,008,661	113,574,292
Deliveries	108,063,907	112,656,121
Surplus	8,995,664	918,171
Previous	173,284,348	182,279,992
Total	182,279,992	183,198,073

The reception of the April statistics was indeed so favorable that they, together with the influence of some large purchases by manufacturers, led to an advance in the price for the metal. The holders of the accumulated stock are in no uncomfortable position, money being still so cheap. They argue that copper is really worth more than it has been selling for lately and they propose to continue to carry the stock, if necessary. They are able to do so. This situation is well recognized by the manufacturing consumers, who do not expect on the one hand to secure any materially better bargains than have lately been going, and on the other hand do not in any way fear the prospect of having to pay the prices of a runaway market. Any idea of a runaway market under present conditions is, of course, highly absurd and probably does not exist in the mind of any but those whose wish for a boom in the stock market is father to the thought. Apropos of the subject of speculation it may be surmised that a part of the stock reported by the refiners really belongs to speculators who are holding it for an advance to a level much higher than exists at present.

The Missouri Geological Survey

The Missouri Geological Survey is again a storm center. Its career has been tempestuous ever since the days of Arthur Winslow. At present the trouble, as previously, is politics. There seems to be something in the air of Missouri that breeds these political-scientific storms. In view of the vicissitudes that have troubled the State geologist of Missouri, and the ax that is constantly hanging over his head, it is surprising that the organization has been able to do as much good work as it has been able to put on record. Indeed, the Geographical Survey of Missouri has been among the most active of State organizations, and has done some of the most important work in the field of economic geology.

In the present difficulty, charges and countercharges are flying like the volleys of gating guns. As nearly as we have been able to unravel the tangle, from the newspaper reports, the situation is substantially as follows: The Geological Survey has been planning to absorb the State Bureau of Mines and Mine Inspection. This has naturally been resented by the latter organization, and it, together with

the owners of mineral lands in the central part of the State, have charged that the Geological Survey has been in collusion with the Federal Lead Company (Guggenheims) to prevent the development of the central lead district. In support of this charge, it is stated that E. R. Buckley, formerly State geologist, resigned that position a few months ago to become mining geologist for the Federal Lead Company, and at the same time H. A. Buehler, who had been mining geologist for the Federal Lead Company, was made State geologist at the solicitation of E. S. Gatch, vice president of the board of managers of the Bureau of Geology, who is president of the Granby Mining and Smelting Company (which is alleged to be controlled by the Guggenheims). To clinch matters it is stated that the Geological Survey recently made a report upon the lands of the Granby company. Other mineowners declare that this report "must have been worth millions of dollars to the Granby company," and one gentleman who owns property in the central lead district says that such a report on his mines would be worth several million dollars to him.

Obviously the grievances are (1) the projected absorption of the Bureau of Mines and Mine Inspection; (2) the adverse reports upon the central lead district by the Geological Survey, when in the opinion of owners of property therein the district contains "billions of dollars worth of lead that should be opened up instead of being kept in the background." Why should the Geological Survey have pursued this disdainful policy? Of course, so that the Guggenheims may be able to gobble up the district. Absorption of the Bureau of Mines and Mine Inspection is naturally to enable the Guggenheims to control them both. What a terrible octopus is this Guggenheim organization!

The way in which some honorable names are being bandied about in this Missouri dispute makes it distinctly worth while to throw some light on the matter, which we will do under the following heads:

(1) The only interest of the Guggenheims in Missouri is the Federal Lead Company, and we are disposed to think that it was more or less of a misadventure. The Guggenheims have feet of clay like many other mortals, and in their Missouri enterprise made initial mistakes that would have wrecked about ninety-nine concerns

out of a hundred. With their command of great resources, they were able to overcome their setbacks and lay their plans to get out even, perhaps a little more, all of which has been beneficent to the people of Missouri, if we may judge from the extent to which the value of mineral land has been bid up in the southeastern district. We do not believe that the Guggenheims have any stomach to repeat their experience in the central district, but imagine that they would be pleased to see the mineowners of that district develop their property in order to supply the smelting works at Alton.

(2) The Granby Mining and Smelting Company has no more connection with the Guggenheims than the Calumet & Hecla has with the Amalgamated Copper Company. The Granby Mining and Smelting Company is, indeed, a Calumet & Hecla of the zinc business, being one of the historic companies in that industry. It owns an extraordinarily large area of mineral land in southwestern Missouri—far more than is owned by any other company—which is leased to individual miners, or small companies. The Granby property covers a distinct mining district. It was eminently proper that the Geological Survey of the State should make a report upon the Granby district, that report being undoubtedly to the advantage of the people generally. It is also eminently proper that a man holding the high position of Mr. Gatch in the mining and smelting industry should be one of the officers of the board of managers of the Geological Survey. It is, furthermore, proper that Mr. Gatch should be instrumental in naming the State geologist. The people of Missouri should congratulate themselves upon escaping the hand of some broken-down political hack and should prize the services of Mr. Gatch, who honors them by serving. No one in possession of his senses could believe for one minute that Mr. Gatch would ever act in any but the most public-spirited way.

(3) It is true that Mr. Buckley and Mr. Buehler exchanged positions, the place with the Federal Lead Company having been found for Mr. Buehler, while Mr. Buckley, whom he was to succeed, was engaged in finishing his work for the State. The people of Missouri are to be congratulated upon enjoying the services of geologists who are capable of securing important positions in private life.

(4) The central lead district was

studied and described with much detail in Winslow's famous report. It has not yet shown any evidence of possessing the importance of either the southeastern or the southwestern districts.

The present dispute illustrates one of the difficulties under which a State official labors as compared with the official of a private company. The latter can dismiss off-hand any mine which the evidence indicates to be not worth the time and expense of an examination. The State official, on the other hand, must fritter away his time and the money of the people in visiting every insignificant prospect, or else be subject to the charge of ignoring "important mineral resources of the State," of course, to serve the purposes of private interests. Politics is the deadly nightshade to science and administration.

We think that the Missouri Geological Survey has made a mistake in planning to absorb the Bureau of Mines and Mine Inspection. The latter has done its work well and the work for which it is organized has nothing to do with the Geological Survey. One organization is to study and promote the development of the mineral resources of the State. The other is to inspect the operating mines and see that there is compliance with the laws of the State. If a State is able to support two such organizations, by all means it ought to do so, and it ought to keep them distinct.

As to the Guggenheims, we think that the people of Missouri have indulged so much in the habit of hunting octopuses that the game has got on their nerves, and they are now apt to mistake a lamb for a monster. The Guggenheims have plenty of troubles of their own. If, however, they show any sign of becoming voracious, we recommend the mineowners of Missouri to follow the plan of those in the Klondike and sell them their properties at as much over the real value as the Guggenheims can be fooled into giving.

The experiments upon smelting zinc ore in the blast furnace which were abandoned at Warren, N. H., two years ago, are to be resumed this spring at Philadelphia, under the direction of F. W. Gordon, who conducted the work at Warren. An entirely new furnace will be built at Philadelphia, on somewhat different lines from that at Warren.

Metallics

We notice this gem of a word in a recent article on organic chemistry:

TETRAMETHYLDIAMINODIPHENYLMETHANE

Platinum ingots as imported in the United States are approximately 5/16 in. thick by 2 to 4 in. wide and weigh about 100 troy ounces each.

According to L. B. Stilwell, the output of the plant of the Niagara Falls Power Company in 1908 was 560,000,000 kw.-hours, equivalent to a saving of more than 1,000,000 tons of coal per annum.

A miner who has been partaking too freely of intoxicants should never be allowed to enter the workings of a mine. He is a menace not only to himself, but to his co-workers. Many instances could be cited of serious accidents caused by the act of some intoxicated miner.

According to J. Bishop & Co., Malvern, Penn., their works was the first establishment for handling platinum in the United States, having been started by Joaquin Bishop in 1842. The process introduced by him for melting and manufacturing platinum for chemical, dental, jewelry and other purposes was subsequently adopted by European manufacturers.

The Dwight & Lloyd sintering machine has been introduced with success at the works of the Ohio & Colorado Smelting Company at Salida, Colo. An installation is now being made at the works of the Federal Lead Company, at Alton, Ill., which will be particularly interesting, inasmuch as a direct comparison can there be made with the Huntington-Heberlein process.

According to John D. Archbold, the Standard Oil Company in 1892 produced from crude petroleum 60,154,790 lb. of crude wax; in 1907 the production was 109,649,553 lb. In 1892 the production of refined wax was 11,271,479 lb.; in 1907 it was 96,564,187 lb. In 1892 the Standard Oil Company produced 2,943,202 lb. of candles; 22,419,073 lb. of candles were produced in 1907.

In keeping his eyes open for carelessness, the mine foreman will do well to pay almost as much attention to the old and experienced miner as to the beginner. The experienced miner often grows careless through long immunity from accidents, taking undue chances and performing some of his duties in a manner that would bring forth from the foreman a well-deserved rebuke if he were a green hand.

According to Edward Brush, in testifying before the Ways and Means Committee, Dec. 16, 1908, the cost of the Garfield smelting works up to that time was in excess of \$6,000,000. That figure is higher than what was previously the common belief. However, Mr. Brush prob-

ably included the money expended in acquiring the great area of land to forestall smoke troubles, which must have been very large.

According to L. B. Stilwell, about 25,000,000 h.p., steam and hydraulic, are installed for industrial purposes. The aggregate power used by our railways is estimated to be approximately 4,000,000 h.p. The Inland Waterways Commission estimates that the amount of water power available in the United States at cost comparable with steam operations is 37,000,000 h.p., which exceeds our entire mechanical power now in use.

The success of the Warwick Iron and Steel Company with the Gayley process is attracting more attention to it. In 1908 nine licenses for equipping Western blast furnaces were given. The experimental plant at the South Chicago works of the Illinois Steel Company is said to have demonstrated that the process can be successfully applied to bessemer converters, the result being a better and more uniform grade of bessemer steel.

In 1908 the Old Dominion Mining and Smelting Company, of Arizona, changed from the use of Eastern coke in its smeltery to coke obtained from Dawson, N. M. It was found that the furnaces could be run with about as low a percentage of this Western coke as of Eastern coke. The lower cost of the Western coke will effect a saving of between \$20,000 and \$25,000 per month, or more than 0.5c. per lb. in the cost of producing the copper of the company.

The mineral rutile, which is now mined in Virginia, has found a new use as a component of the electrodes for arc lamps. However, the demand for it is still very irregular. Besides that which was used by the domestic electric companies a considerable exportation was made in 1908. The value of rutile, 97 per cent. pure, varies from \$100 to \$160 per 2000 lb. For use in the electric industry it must be quite free from most foreign substances. Anything that slags easily is bad for an arc lamp.

It is reported that the Gasmotoren-fabrik Deutz, of Germany, is about to introduce an internal-combustion engine to be driven by solid naphthalene, which is a cheap by-product obtained in the manufacture of illuminating gas. It is a solid, melting at 79 deg. C. The engines are to be furnished with a special tank in which the naphthalene will be melted by the waste heat from the exhaust and the cylinder water jacket. The air to be carbureted will be heated to avoid solidification of the naphthalene.

In sighting at a plumb-bob string in underground surveying a piece of white paper held behind the string and as close to the candle, or other illuminant, as possible, is a great aid to the transitman in making the sight. A permanent and use-

ful arrangement for such work is a cigar box from which the cover has been removed, and a piece of tracing cloth attached to its place. When a lighted candle is put in place in the box and the contrivance held behind the plumb-bob string, the transitman experiences no trouble in finding the sight.

Some of the zinc blende ore of Mexico is high in fluorspar, separation of which by ordinary methods of milling is difficult. The ore of the San Francisco del Oro and Tecolotes mines is of this character. Shipments of concentrates to European smelters have been rejected because of the presence of 5 per cent. of fluorspar. American zinc ores are generally free from that objectionable impurity, but it occurs at Marion, Ky. Some good separations of these ores have been made by fine grinding, very careful sizing, and treatment on pneumatic tables.

When it becomes necessary to enter an old or abandoned shaft, some idea of its general condition may be obtained by the use of an ordinary hand mirror. A sun-beam reflected into the shaft by means of the glass will illuminate the shaft for several hundred feet. If a hand mirror is not available, a highly-polished tape reel, the inner surface of a watch lid, or any other polished reflecting surface, may serve the purpose. Of course, it is necessary that the sun be shining and that the shaft be in the open. By the use of this simple expedient, it is often possible to determine whether or not the shaft is safe.

The customary method of exhibiting mill products is to bottle them. An ingenious and effective system is used by D. V. Keedy. He employs an ordinary album with stiff leaves, which may serve for mounting photographs. Marking out a rectangle, say, 1x2 in., he coats it with Lepage's liquid glue and sprinkles on the concentrate, midlings, tailings, etc., just as sandpaper is made. Of course, this is limited to the fine sizes, say, 2 mm. and less. A single page may show a series of five or six products in one column, and the assays, remarks, etc., in a parallel column, thus making a highly effective presentation.

An alloy containing 47 to 50 per cent. silicon, 15 to 25 per cent. calcium and 2½ to 6½ per cent. of aluminum is now on the market. It is used for the deoxidation of another metal, silicon, aluminum and calcium being very energetic reducing agents. Added to molten steel in the ladle, it calms the steel and enables the tapping of sound ingots. The product of the reaction is a double silicate of calcium and aluminum, which melts very easily, the slags ascending to the surface of the steel. The new alloy is said to give better results than aluminum, even when it is added into the ingot mold itself, because it forms an easily fusible slag which disengages from the steel.

Views, Suggestions and Experiences of Readers

Comments on Questions Arising in Technical Practice and
Debatable Points Suggested by Articles in the Journal

CORRESPONDENCE AND DISCUSSION

Tonnage Estimation in Dumps, Open Cuts, etc.

The article by R. J. Donaldson in the JOURNAL of March 27, 1909, on estimating tonnages in dumps, open cuts, etc., has suggested several practical cases that I have met with during my mining experience. Taking up the subject of open-cut measurements first, I am reminded of a system I used at the Bertha zinc mines in Virginia in 1890-91. The ore was originally extracted there by the open-cut method, and a contract had been let for stripping the overburden, paying for the same by the cubic yard.

Those readers who are familiar with the occurrence of the Bertha ores will remember that they lay in pockets and bunches upon the limestone, which had weathered away into an extremely irregular surface formed of deep cavities and high "chimneys." The limestone was overlaid by a deep covering of clay formed from its decomposition.

It was impossible, without consuming much time and labor, to measure the quantity excavated by any system of cross-sectioning, in which the numerous irregularities in the bottoms of the cuts could be taken and recorded. The original surface of the working area was, therefore, divided into 10-ft. squares, and the elevations taken at the intersection points. The elevations at the projection of these points were taken when the estimate measurements were made each month, and the volume determined by planimetry of the plotted vertical sections of 10-ft. intervals.

The lines running in one direction were numbered 1, 2, 3, etc., and those at right angles to them were designated A, B, C, AA, BB, CC, etc. Three leveling instruments set at different heights were used, and a long cord having leather tags 10 ft. apart could frequently be stretched parallel to the face of the cut where jutting ridges permitted parallel lines of stakes to be set to fasten the cord. A ring, through which was passed a long line with a plummet attached, was placed on the tagged cord, and the rodman would flip the ring to a tag and determine the point on the ground with the plummet. Frequently all of the instruments would be set too high to take a reading on the rod, in which case the rodman would tie the ring of a tape to one end of the plummet and pull it up until the cross hair of the instrument would

cut the tape ring. The distance to the ground would then be called to the instrument man.

A unique system of note keeping was used, and as I remember it, was as shown in the accompanying sketch:

SYSTEM OF NOTE KEEPING.									
Inst. No. 1. Ht. = 112.40				Inst. No. 2. Ht. = 96.30					
A1 10.4	A2 8.6	A3 12.5		A4 3.1	A5 7.6	A6 10.2	A7 12.5		
B1 9.8	B2 12.4			B3 6.2	B4 8.7	B5 10.2			
Inst. No. 3. Ht. = 80.42									
B6 2.1	B7 6.4	C1 0.5		C2 8.3	C3 10.8	C4 12.5	C5 15.2		
C6 20.7	C7 23.1								

The heights of the instruments were determined by turning points from bench marks in the usual way, recorded in another portion of the book, and copied on the page, as shown in the sketch. The remaining notes represent the stations at the intersections of the 10-ft. squares, with the rod readings placed under them.

While engineer for the Ducktown Sulphur, Copper and Iron Company, I was required to estimate a large quantity of ore that had been broken in the West vein of the Mary mine, and lay upon and around a timbered gangway. The ore had been stoped on contract by the ton, and as the mine was being closed down for some time, it was necessary to obtain a close estimate of the tonnage in the piles, in order to settle with the miners. As the surface of the broken ore was very irregular, and it was impossible to get at the sides of it, I was unable to measure it by a direct method. All of the ore from the vein had been stoped on contract by the ton, and a complete record of the tonnage trammed from it was available. I had taken precise cross-sections of the opening at 30-ft. intervals, and was able to compute the volume of the ore stoped from it. To get at the weight of the ore in place, I determined the specific gravity of several representative samples, and took an average of them. I found this to work out to almost exactly a cubic foot to the long ton, which was the unit used, the company being an English concern. By deducting the amount mined and shipped from the total quantity stoped, I derived a close estimate of the quantity remaining broken in the mine.

It frequently happens that an engineer for a mining company is called upon to estimate small quantities of broken material that has been left in the mine or on the surface, and is inconvenient for the company to move and weigh. This material has usually been broken or transported by laborers on contract, and it is essential to obtain an accurate estimate of its quantity. It is generally piled in irregular masses where the surface has not been previously determined. I have frequently attempted to make estimates of this kind, and I must say that Mr. Donaldson's statement, "when called upon to measure a dump on irregular ground, with no previous levels on record, a vivid imagination is exceedingly useful," is just as exceedingly true. However, I have sometimes found that the parties who are to be paid for the material have not much respect for my imagination, and where my estimate has been checked by shipping and weighing, I have learned that my imagination was not always sufficiently vivid to afford them what was due. It is extremely unsatisfactory to make an estimate of this kind, and should be avoided if possible.

I estimated the ore reserves of the Tennessee Copper Company, by calculating parallel cross-sectional areas through the orebodies and deriving the cubical content from averaging them, and multiplying by the perpendicular distance between. The density factor used was 8 cu.ft. per short ton. After obtaining the total tonnage of the developed orebody, I would deduct the amount mined and shipped to obtain "ore in sight." I think this is a more accurate method when the prismoidal formula is used, than that which Mr. Donaldson suggests, of measuring the areas of sections of "proved unstoped ores," especially where the stoped portion cutting two successive sections varies greatly in area, as it certainly does in the Ducktown mines. Of course, the closer together the sections are taken the more accurate will be the results in any method used. Careful records of the ore mined and shipped should always be kept by a mining company.

It might be of interest to state that the weight of the slag produced in smelting the Ducktown ores is just about equalled by that of the ore smelted. I found this to be true by measuring the slag dump of the Tennessee Copper Company, and computing its volume and weight. From the records of ore shipments, the weight of the ore smelted was, approximately, equal

to the calculated slag weight in a total of over 500,000 tons.

B. H. CASE.

Asheville, N. C., May 1, 1909.

Alumina in Copper Blast Furnace Slags

In reference to the discussion concerning the part played by alumina in copper blast-furnace slags, Mr. Beardsley, in his letter to the JOURNAL, Jan. 23, 1909, has ably supported my contention, and from his personal acquaintance with the materials has apparently put the matter beyond question. His affirmation, however, that my statement regarding the lime content of the slag was incorrect is a misinterpretation; I quoted from Heinrich's slags, Nos. 1 to 4, as given in Mr. Shelby's original paper, and did not know of the slags 5 to 9, which, I presume, were given in the 1886 article. These had not been quoted at all previously, and my remark, as applied to the slags quoted, was correct.

In Mr. Shelby's article in the JOURNAL of Dec. 26, 1908, he suggests an error, which I must admit had crept into my letter. I should have stated that the magnetic oxide floated on the "matte" instead of on the "charge." It was to be found both in the slag and the matte, and unlike Mr. Shelby's experience, I found that it was easily separated analytically, owing to its insolubility in acids, being unaffected by fusion with alkalis and its affinity for the magnet.

HARLEY E. HOOPER.

Richmond, Nelson, New Zealand,
March, 16, 1909.

Zinc and Sulphur in Mexico

The zinc production in Mexico has experienced some revival with the removal of all duties on zinc ores into the United States. Anticipating the enactment of the Payne tariff measure, considerable ore has been rushed from northern Mexico into the States. The importance of the zinc deposits in northern Mexico has been greatly exaggerated in the tariff campaign. Most of the carbonate and silicate ore from Nuevo Leon, Coahuila and Chihuahua, has come from old lead silver workings, from which it was easily obtained. The general result of the operations on deposits of this class of ore has been to prove that they do not extend in depth, and that they will not, in the future, individually or collectively, yield zinc ore extensively. The future great production of zinc in Mexico will come from the treatment, by special processes, of the complex zinkiferous ores, which abound in nearly all of the camps. Heretofore these have been either left in the ground, or sent to the smelters where the zinc

passes into the slag and is lost. In the cyanide camps zinc sulphide is not considered as detrimental to the process up to a considerable per cent. and passes into the tailings from which no attempt at recovery has as yet been made. Magnetic and pneumatic separation devices have been installed and operated at Charcas and San Luis Potosi, at Santa Barbara and Calera in Chihuahua, and at Ocotlan, Oaxaca. It is probable that these processes will be more extensively installed in the immediate future, and that flotation and other methods will be used to beneficiate the complex ores, making a marketable zinc product and at the same time improving the grade and quality of the ore for smelting or cyaniding. Some shipments of zinc ore from Taxco, Guerrero, have been made to Europe recently via Vera Cruz. This ore is high in iron and lead and is not desired by the smelters in the United States. Large quantities of zinc ore exist in the camps of Zaucahpam, Temescaltepec, and Sultepec in the south of the State of Mexico, but they are entirely unavailable at the present time, owing to lack of railroad connection. Recently some promising zinc operations have been undertaken in Jalisco, Sinaloa and Sonora, in the districts tributary to the Pacific coast ports. This ore is mainly sulphide, and will be shipped by boat to Europe or via the Tehuantepec Isthmus line. Many of the Mexican zinc-sulphide ores carry silver, and the smelters in Europe pay about half the market price for the silver content over 5 oz. There is no export duty on zinc ores from Mexico, and the silver in these ores under 250 gm. is exempt from export tax.

Sulphur is being shipped from Mexico to Europe from the Los Cerritos deposits between Tampico and San Luis Potosi. All the product is in demand at good prices. The sulphur deposits at Conejos, near Torreon, are being worked intermittently to supply the dynamite factory, at Gomez Palacio, and for local demand. Other important sulphur deposits exist in Tamaulipas and in lower California, but they are not being worked, owing to their distance from the railroad. The much vaunted Popocatepetl deposit in the volcano, near Mexico City, is a myth. It is true that the Spaniards obtained sulphur from the crater for the manufacture of gunpowder, and at other times small supplies have been obtained for local uses. A few years ago the deposit was exploited in the interests of certain New York capitalists, and it was reported that there were millions of tons to be obtained. The fact is the supply is very limited, being merely incrustations of native sulphur on the rocks in the bottom of the crater in which there are a few vents which give forth continually vapors and fumes. The volcano is 18,000 ft. high, snow capped, and difficult of ascent, and the vents are at the bottom of a crater 2000 ft. deep, with

steep walls, so that, considering the limited supply, and the difficulties of operation, Popocatepetl can be eliminated as a possible source of a sulphur supply now and hereafter. An interesting sulphur supply is found at Sierra Mojado, Coahuila, in one of the mines belonging to the American Smelting and Refining Company. Native sulphur forms the matrix of an ore containing iron and lead carbonates with silver. An effort was made to extract the sulphur by the use of superheated steam, but owing to the physical character of the ore, the resulting product in the retorts formed a slimy mass which retained the liquified sulphur by capillary action and prevented a successful extraction. A modification of the method of treatment is being investigated and if successful this deposit may become a considerable producer of sulphur as a by-product. At none of the smelters in Mexico is the sulphur from the fumes saved.

Separating Metals in Solution

Herbert H. Dow, of Midland, Mich., and Walter S. Gates, of Worthington, Can., describe in U. S. Pat. 913,708 and 913,709, March 2, 1909, a process of separating metals, particularly iron, copper and nickel, from the same water solution as precipitates, each substantially free from the others. The basic principle is, the purification of any precipitated metal by agitating the precipitate in a solution containing soluble salts of the more insoluble metal. The water solution of iron, copper and nickel is agitated in any suitable vessel with powdered limestone in an amount equal to the chemical equivalent of the iron in the solution. This results in the precipitation of most of the iron as a hydrate and by a prolonged agitation of the precipitates in the original solution, the iron precipitate is purified. The excess of iron salt slowly dissolves the copper and nickel basic carbonates contained in the insoluble ferric hydrate, and precipitates in turn more ferric hydrate. After a prolonged agitation with a proper reagent the ferric hydrate is found to be substantially free of the copper and nickel basic carbonates, and the solution free of iron. Similar steps are taken for the precipitation of copper and nickel. This principle can also be applied to the separation of aluminum from nickel and copper, as well as iron in both conditions of oxidation.

All of the leading mining companies in the silver-lead district of Western Tasmania, according to Consul Henry D. Baker, showed a diminution in their earnings during 1908, with the exception of several companies engaged in mining coal; this was the only mineral product whose value showed an increase over that of 1907.

ELEMENTS OF OPTICAL MINERALOGY. An
Introduction to Microscopic Petrog-
raphy. By N. H. Winchell and Alex-
ander N. Winchell. Pp. 502; illus-
trated. $6 \times 9\frac{1}{2}$ in.; cloth, \$3.50. New
York, 1909: D. Van Nostrand Com-
pany.

Contents: Certain phenomena of light.
Elements of mineralogy. Application of
polarized light to crystalline substances.
Description of minerals. Analytical tables.
Appendix.

TEXT BOOK OF PETROLOGY. By F. H. Hatch.
Fifth edition, revised and rewritten.
Pp. 404; illustrated. 5×7 in.; cloth,
90c. London, 1909, Swan Sonnen-
schein & Co.; New York, The Mac-
millan Company.

This well known treatise is a summary
of the modern theories of rock genesis,
and includes a description of the rock
forming minerals and the chief types of
the igneous rocks. It is one of the most
satisfactory works upon the subject of
petrology and students will be glad to have
it in this thoroughly revised form.

MINING METHODS IN EUROPE. By Lucius
W. Mayer. Pp. 169, illustrated.
 $6\frac{1}{4} \times 9\frac{1}{4}$ in.; cloth, \$2.50. New York
and London, 1909: Hill Publishing
Company.

Contents: Mining in Great Britain.
Mining in Germany, France and other
countries.

This book does not pretend to be a
broad treatise on the subject implied by its
title, but rather is the journal of a visit
for technical study among some impor-
tant mines in Europe. Several of the
chapters composing the book have pre-
viously been published as papers in the
JOURNAL and elsewhere. They describe
some interesting and unique mining meth-
ods and are well worth perusal.

ASPHALTS: THEIR SOURCES AND UTILIZA-
TIONS. By T. Hugh Boorman. Pp.
172; illustrated. 7×10 in.; cloth, \$3.
New York, 1908: William T. Com-
stock.

Contents: Discovery and early use of
asphalt. Rock asphalt mastic or asphalt
coulé. Trinidad asphalt. Petroleum
residuum and California malthas as a
fluxing material. Venezuela asphalts.
Cuban asphalts. American bituminous
limestone. Bituminous asphalt sandstone
rock. Manjak and uintaite. Late Euro-
pean work. Turkish and other bitumens.
Developments of asphalt industry up to
1903. Asphalts in 1908. Asphalt in build-
ing construction. Dustless roads. Meth-
ods of surfacing roads. Asphaltic oils,
their classification and properties. Appli-
cation of asphaltic oils. Sprinkling with
asphaltic oils. Latest views of engineers
on asphaltic surfacing. Municipal asphalt
plants. Asphalt waterproofing. Asphalt

in roofing. Asphalt for manufacture. As-
phalt machinery.

This is an interesting and valuable
treatise upon an important subject in
which the author is a well known expert.

THE WORLD'S GOLD. By L. de Launay.
Translated by O. C. Williams, with
an introduction by Charles A. Conant.
Pp. 242; $5\frac{1}{2} \times 8$ inches; cloth, \$1.75.
New York, 1908: G. P. Putnam's
Sons.

The sub-title of this important work is
"Its Geology, Extraction and Political
Economy." The last is the main subject,
the geological occurrence of the metal and
the methods for its extraction being dis-
cussed as leading up to it. The geological
treatise is of much interest and value, as
naturally to be expected from this dis-
tinguished author. The treatment of the
methods of mining and metallurgical ex-
traction are far less satisfactory. The
economic section is of absorbing interest.
This deals chiefly, of course, with the
great question of the day, viz., "Has the
value of gold depreciated?" or "Is the
rise of commodity prices due to the in-
creasing production of gold?" While
fully recognizing the effect of gold supply
upon commodity prices, Professor de
Launay holds, like many other economists,
that that effect, one way or the other, is
generally offset by other factors, and in
general he denies the depreciation theory
that has lately found much acceptance.
In this we fully agree with Professor de
Launay.

MILLWRIGHTING. By James F. Hobart.
Pp. 401, illustrated. $6\frac{1}{4} \times 9\frac{1}{2}$ in.; cloth,
\$3. New York and London, 1909:
Hill Publishing Company.

Contents: The millwright and what he
is. Factory location. Laying out the
buildings. The builder's level and founda-
tions. Foundations and the carpenter's
level. Erecting building and machinery
foundations. Erection of buildings. Walls
and machinery supports. Roof timbering
and trusses. Strength of materials. Lay-
ing out shafting. Putting pulleys in place.
Belts and belting. Setting up machines.
Babbitting, scraping and lubricating. Steam
and water pipe fitting. Erecting steam en-
gines. Steam boiler setting. Some shop
work. Water wheel setting.

The scope of this book is indicated by
the table of contents reproduced above,
but even the latter fails to give a thorough
idea of the great variety of subjects
treated by the author and the minuteness
of his details. As a matter of fact he
takes up every kind of work that the mill-
wright erecting a building, a mill or fac-
tory, and setting machinery is required to
do and his advice is uniformly sound. A
distinguishing feature is its eminently
practical character. It is an uncommonly
good book and will be highly useful to
engineers, including the mining, metal-
lurgical and chemical, as well as to mill-
wrights and erectors.

Personals

Mining and metallurgical engineers are invited to keep THE ENGINEERING AND MINING JOURNAL informed of their movements and appointments.

R. Gilman Brown has been in West Africa, and will soon return to London.

Edward L. Dufourcq has left New York on a professional trip to Colorado and Mexico.

Washington B. Vanderlip has opened an office as consulting mining engineer at 42 Broadway, New York.

George D. Reid, who has been examining copper properties in Idaho and Oregon, has returned to Denver.

A. M. Yonge has been appointed general superintendent of the Aguacate mines, San Mateo, Costa Rica.

Quincy A. Shaw, vice-president of the Calumet & Hecla, is in the Lake country, on one of his semi-annual visits to the property.

Dr. W. F. King, chief astronomer of Canada, has been appointed superintendent of the Geodetic Survey of Canada, just established.

J. W. Astley, of Victoria, B. C., is in Ontario, making a trip in the Cobalt and Gowganda districts, with a view to following his profession there.

Emmet D. Boyle is completing the erection of the Nevada Gypsum Company's new plant at Mound House, Nev., and will remain at that place until June.

W. S. Keith has been appointed assistant manager for C. Christopher and associates, of Seattle, Wash., who have bought the rights of the Cotton matting furnace for several of the northwestern States.

George E. Farish, of Denver, Colo., and Mexico City, left Denver on May 3 to examine some properties in southern Mexico. His address for the next three months will be 2 Bucareli, No. 35, Mexico City, Mexico.

A. R. Wilson has resigned as superintendent for the Maple Leaf Coal Company, Frank, Alberta, having been appointed a coal-mine inspector by the government of Alberta for the district east of Lundbreck.

C. H. MacMillan, formerly superintendent of the Dominion Iron and Steel Company, at Sydney, N. S., who has been resting in Maine for a year or so, has been appointed superintendent of the steel department of the company.

Prof. Charles Baskerville, director of the Chemical Laboratory, College of the City of New York, will sail for London on May 15 on the steamer "Kroonland," to attend the Seventh International Congress of Applied Chemistry. He will be abroad all summer.

Ernest V. Moore, Herbert Garnett and Francis J. Bulask have associated them-

selves under the name of the Peat Engineering Company and established an office in Toledo, Ohio, where they will act as consulting engineers on all questions relating to the utilization of peat and peat bogs.

Norman W. Haire has resigned as general manager of the properties that comprised the Bigelow group in the Lake Superior copper district and is succeeded by James MacNaughton, general manager of the Calumet & Hecla. Mr. Haire will make his permanent home at Houghton, Mich.

R. M. Atwater, Jr., Robert Linton and R. de Sallier have been examining the Dominion Copper Company's mining properties, in the Boundary district of British Columbia, for the protective committee of dissenting stock and bondholders, who are opposed to the reorganization scheme of the majority.

A. S. Dwight has not taken charge of the Humboldt works as general manager for the Consolidated Arizona Smelting Company, as has been erroneously stated in the press. He is at Humboldt as consulting engineer, to try to develop a rational and safe program for resumption of operations, and is being assisted by Francis N. Flynn, mining engineer, of Globe, Ariz. Mr. Dwight will go from Humboldt to Douglas and expects to be back in New York early in June.

Obituary

J. Fewson Smith, a pioneer among Utah engineers, died at Salt Lake City, May 5. He was born at Preston, England in 1834 and educated as a civil engineer. He went to Utah in 1863, and there engaged in active work. He was employed in the construction of the Union Pacific and the Utah Central railroads and the Oregon Short Line. Later he located and supervised the construction of several narrow-gauge roads intended to open the mining districts of Utah—among them the American Fork, the Bingham Cañon and the Pleasant Valley railroads. At different times he conducted extensive explorations in southern Utah and Nevada, and he always predicted an important future for the mineral interests of those districts. He was not a civil engineer only, but had done much mining work. For many years he held a commission as deputy mineral surveyor, and many of the more important mining camps in Utah are built up around the claims he originally located. This is especially true of Bingham, where he did so much of the early work. He also made many of the earlier government-land surveys in various parts of Utah; did some municipal work, and has frequently been called into consultation in matters of hydraulic installations, both in Utah and other western States. In this way he was connected with the

early placer mining in southern Nevada. Between 1891 and 1899 he spent much time in Mexico, where he was engaged in engineering and exploration work in Chihuahua and Sonora. He served some years as chairman of the water commission of Salt Lake City. Some of his later work was done for the United States Smelting, Refining and Mining Company, for which his son, J. Fewson Smith, Jr., is mining engineer. A few years ago Mr. Smith retired from active work on account of advancing age.

Societies and Technical Schools

Coal Mining Institute of America—The summer meeting will be held at Punxsutawney, Penn., during the last week in June.

Coal Mining Inspectors' Institute of America—This society will hold its summer meeting at Scranton, Penn., beginning June 8 next.

Institution of Mining and Metallurgy—The annual dinner of the institution was held in London last week under the chairmanship of Edgar Taylor, the president for the present year. There was a large gathering of members and guests. The important work that the institution is doing in promoting and in maintaining a high standard for professional conduct, was referred to by the speakers.

West Virginia Coal Mining Institute—The next meeting will be held at Elkins, W. Va., June 1 and 2. The meeting, in considerable part, will be devoted to the discussion of accidents and their prevention. Addresses or papers are expected from J. A. Holmes, Frank Haas, W. A. MacCorkle, Clarence Hall, F. C. Albrecht, D. T. Evans and A. G. Morse.

Canadian Mining Institute—The fifth general meeting of the Western Branch of the Canadian Mining Institute will be held at Coleman, Alberta, on May 25, when several papers by members on mining and metallurgical subjects will be read and discussed. The branch numbers about 200 members, including all members of the institute resident in western Canada and adjacent parts of the United States. Thomas Kiddie, manager of the Le Roi Mining Company's smelter at Northport, Wash., is this year's chairman, and E. Jacobs, Victoria, B. C., secretary.

California Mineowners—At a large meeting of mineowners, held recently in San Francisco, the result of the discussion and deliberation was formulated in a resolution to the effect that a fair interpretation of the term "period of employment for all persons engaged in work in underground mines" should mean work "at the face" and not include the time taken by miners and other employees in going to and from the face, or the time taken for meals.

Special Correspondence from Mining Centers

News of the Industry Reported by Special Representatives at San Francisco, Butte, Denver, Indianapolis, Goldfield, Salt Lake City, Mexico

REVIEWS OF IMPORTANT EVENTS

San Francisco

May 8—The El Dorado-Placer Dredging Company has been organized at Auburn, Placer county, to mine by dredges the auriferous bed of the American river, which stream forms the boundaries of Placer and El Dorado counties. Los Angeles, San Bernardino and Tucson men are interested, among them E. K. Hum, W. J. Variel, M. E. Williams, D. H. Gillan, B. F. Bledsoe and Thomas F. Wilson. The company has been organized under the laws of Arizona. The Northern California Mining Company, which recently started a new suction dredge on the Klamath river near Hamburg, owns many miles of the bed of the Klamath river. There are many large rocks and boulders to be encountered and predictions of failure of enterprises have been made by old-time miners. It is already found that wood fuel is too expensive and arrangements are being made to use fuel oil. The first gold dredge in the Butte Creek section of Butte county was put in operation last week after several preliminary tests. Work has been commenced six miles southeast of Chico. Los Angeles men are the principal owners in this new enterprise.

The Appellate Court has handed down a decision adverse to the appeal of the Grand Pacific Gold Mining Company involving the Bully Boy placer claim in Calaveras county. The decision is to the effect that the San Domingo Gold Mining Company is awarded the mine on the ground that its title was properly obtained.

On application of R. G. Hart, the Superior Court at Yreka, Siskiyou county, has issued an injunction against Mitchell & Fairchild ordering them from making any excavations or doing any work on the Inyo or Digger Squirrel claim in Humboldt district, a few miles from Yreka. Hart claims that he is the original locator and that the others have located over the same ground.

The Idaho-Maryland mine at Grass Valley, which has had 20 stamps at work for some time will soon have the other 20 of the mill at work, there being now ore enough coming out to keep them all busy. The ledge being now worked is quite wide and runs over \$10 per ton.

After a year or more of experimenting, those in charge of the electric iron-ore smelter at Heroult, Shasta county, consider that they have made a commercial success of the project. The large new furnace was tapped for the first time last

week. It is expected that the furnace will turn out about 200 tons of commercial pig iron daily.

Butte

May 5—In the case of the South Butte Mining Company against the East Butte Mining Company, the motion of defendant for a new trial was recently denied, and an appeal will be taken to the supreme court of the State. The court some time ago decided that the South Butte Company was entitled to the ground over which the dispute arose and also awarded the South Butte Company judgment for \$19,531 as damages for the taking of ore from the disputed ground. It is reported that the Northern Pacific railway is planning to build from Mandan to Glendive. The route was surveyed two years ago.

The Montana State Railway Commission held a hearing last week at which the advisability of establishing joint freight rates between the Northern Pacific and the Billings & Northern railways was considered. The commission has taken the matter under advisement.

In the case of the South Butte Mining Company against Frank H. Cooney, the Federal district court has recently entered a decree in favor of the mining company quieting its title to numerous mining claims near the tracks of the Great Northern railway in the southern part of Butte.

Denver

May 7—A celebration of the fiftieth anniversary of the discovery of gold in Colorado by George Jackson in January, 1859, was held at Idaho Springs today, when a monument was unveiled and dedicated. It was erected on Jackson Bar, Clear creek, where the first gold dust and nuggets were found. Many pioneers, now leading men of the State, attended the ceremonies.

There is considerable loose talk just now in the local mining and quasi-mining papers of this State about the discovery of radium ore, meaning the pitchblende (uraninite) of the Wood and other mines in Gilpin county. In this connection it is important to remember that Dr. Richard Pearce was the first to note the existence of, and to identify, pitchblende, the commercial source of radium in that district. He not only identified the ore, but purchased all in sight and sent it to Europe, realizing a neat sum on the transaction.

The agitation here by the tungsten producers and the commercial association, it now appears, will result in a delegation being sent to Washington, to endeavor to secure enough votes to carry the amendment of Senator Guggenheim providing for a 20 per cent. ad valorem duty on the ore.

At Leadville, the Yak tunnel is said to be advancing at the rate of 10 ft. per day and will reach and drain the Dolly B. mine during the summer. The tunnel has already drained the Resurrection No. 1 shaft to within 35 ft. of the bottom. The Leadville district mill has been reopened, and is treating the sulphide ores from the Ibez lease. Work has also been started again on the Colonel Sellars zinc dump, and the product is being sent to the Empire Zinc Company's plant at Canon City.

It is reported today that the Golden Cycle Mining Company has purchased the property of the Pikes Peak Coal Company, in addition to the 1500 acres which it already owns in the coalfield four miles north of Colorado Springs, and will build a power plant at the Pikeview mine to supply power to its mill in the valley and its mine on Bull hill. It is stated that the initial cost will be \$200,000, and it will start with a capacity of 1200 kilowatts.

Work was commenced on the aerial tram from the Midget mine, on Gold hill, to the Gold Issue mill, on Carbonate hill, a distance of two miles. This is following the lead of the Cresson company, on Raven hill, whose tramway paid for its construction in less than one year. It is said that many other mines more or less remote from the railway will adopt this plan of delivering their ores direct into the cars.

At Crisman, near Boulder, the better price and outlook for silver has resulted in the installation of machinery for the reopening and working on a large scale of the Yellow Pine mine, which is credited with the production of about half a million dollars in silver.

The mining exchange of Colorado Springs has declined to contribute \$5000 toward the completion of the Cripple Creek deep-drainage tunnel, on the ground that the brokers were large stockholders of companies which had already contributed.

At Idaho Springs the Albro mine, which is credited with a production of gold and copper to the value of \$600,000, is to be developed at a depth of about 700 ft. below the surface by a tunnel 1500

ft. in length, and which is already in 700 ft. Work was resumed on the tunnel this week. In the same camp a strike is reported in the Lucania tunnel of lead and copper ore. This tunnel is already advanced over 4000 ft. from the portal, and 2000 ft. more will put the heading under the upper end of Russell gulch, and drain the mines of that section. At Georgetown a strike is reported in the Sunburst mine on Democrat mountain, 2 ft. of high-grade silver-lead ore having been encountered.

At the silver camp of Aspen, the improvement in the price of that metal has already caused greater activity, and in the Della S., leased by the Smuggler company, a large orebody is stated to have been opened on the ninth and tenth levels. A joint pumping arrangement has been entered into by the Aspen, Durant, Argentum-Juniata, Mollie Gibson, Park Regent, Mineral Farm and Smuggler, the managers of which are to unite in installing a big pump on the Free Silver shaft. The Smuggler, which has hitherto pumped for these properties, is also increasing its working force.

At the mines around Ashcroft the same activity prevails, and on the big silver-lead Tam O'Shanter mine a ten-year lease, with option of purchase, has been granted to responsible men, and operations will begin as soon as the snow at that elevation (12,000 ft.) will permit. The asbestos deposits on Casper mountain, Wyo., are to be developed this summer for immediate production by the North American Asbestos Company.

Indianapolis

May 11—One important mining case to be tried in the Circuit Court this term is that of Benjamin Simpson against the Big Four Railroad Company for damages in the sum of \$200,000. The suit grows out of the flooding of the plaintiff's mines, in Clay county, through the alleged negligence of the railroad company.

The suit is important because it is the first of the kind in the State and mine owners are interested in the result.

Simpson owns and operates a system of mines in Clay county through which the St. Louis division of the Big Four runs. When the improvements were made in the tracks of the company, the grade was lowered to a considerable depth through plaintiff's coal lands, and in blasting an opening was made into a tunnel which Simpson had constructed under the track. Soon after this heavy rains came and the mines were flooded. The railroad company defends on the ground that Simpson had no right to make these tunnels without its consent or knowledge, and that the State law provides that all mineowners shall file a complete plan of their mines in the county recorder's office in the county in which they operate, and also

with the State mine inspector, neither of which Simpson has done, it is alleged.

The announcement of the Indiana Steel Company that the construction of coke ovens for the local plant at Gary will begin immediately is received with favor by Indiana coal operators. The first lot of ovens to be built will number 560 and will use nearly 7000 tons of coal a day. The ovens are expected to furnish coke for the operation of ten blast furnaces. The site of the ovens is on the Gary harbor, just east of the blast furnaces now in operation, and will cover 300 acres of land. The gas from the coke ovens will be used for fuel in the mills and throughout the city and vicinity.

Two new coal-mining companies were incorporated during the past week. The Optimo Mining Company, with home office in Indianapolis and the Alliance Coal Company, also of Indianapolis.

In the case of Frank B. Mahan vs. The Hymera Coal Mining Company the Indiana Appellate Court holds that when a coal-mining company permitted the "wall" between two entries to be reduced in thickness to 5 ft., and then permitted a shot to be drilled and placed in this thin partition so as to blow out the wall from the other side and injure a workman employed in the adjoining entry, who had no knowledge of how thin such wall was, the depth at which the shot was placed, nor that it was about to be fired, the company is liable in damages. The court further held that the negligence of a fellow servant in placing and firing the shot concurred with its own negligence to cause the injury, is no defense to an action based on a complaint alleging that the injury was due to insufficient and unsafe thickness of the pillars left standing between the entries.

Salt Lake City

May 7—The business of the Government assay office at Salt Lake City showed a marked increase for April. The total value of the bullion handled during April was \$119,426. The number of ounces was 13,080, the value of the silver in the bullion being \$2057. The large customers of the Salt Lake office are the Consolidated Mercur Gold Mines Company with an output of \$60,000 to \$70,000 per month and the Bamberger Delamar Company whose bullion product amounts to about \$40,000 per month. The remainder of the receipts is made up from various sources.

The permanent organization of the Utah Stock and Mining Exchange is being completed. The election of four additional directors is to take place on May 8. The work of fitting up the call room for the exchange has been delayed. It is expected that the exchange will start transacting business about May 15.

Thirteen shipments during the past week were as follows: Centennial Eu-

reka, 45; Eagle and Blue Bell (leasers), 1; Eureka Hill (leasers), 3; Bullion Beck (leasers), 2; Utah Consolidated (leasers), 1; Sioux Consolidated, 14; May Day, 5; Mammoth, 6; Beck Tunnel, 3; Black Jack, 13; Brooklyn, 5; Iron Blossom, 41; Dragon Iron, 35; Colorado, 23; Yankee Consolidated, 4; total, 205 cars.

The International Smelting and Refining Company has completed six of the seven miles of railroad track that is being constructed to connect the new smelter site of the company with the San Pedro, Los Angeles & Salt Lake railway's main line. A 500-ft. steel trestle has also been finished.

The month of April was the greatest month in the history of Bingham in the mining and transportation of ore, 6128 cars of ore being shipped. The greater part of this tonnage was shipped by the Utah Copper and Boston Consolidated companies. Of a total of 337,040 tons produced by the camp, the Utah Copper Company shipped 264,550 tons; the Boston Consolidated, 58,905 tons; the Utah Apex and Bingham-New Haven, with a few other companies, contributed the balance of the ore shipped.

The annual meeting of the shareholders of the Silver King Coalition Mines Company will be held on May 17. Up to date the Silver King mines have returned to the shareholders earnings in excess of \$12,000,000.

The silver-lead smelting plant of the American Smelting & Refining Company at Murray, is out of blast by reason of a walkout of the foreign laborers who wanted a 25-cent increase, a restoration of the schedule of wages in force before the panic. While the mechanics and other Americans employed were not directly connected with the movement of the Greeks and Austrians, nevertheless they decided to stay away until the matter has been adjusted. The Murray plant has eight blast furnaces, but only five were in blast at the time of the walkout. These have been hanked. Notices have been posted at the works stating that all foreigners employed at the smelter were discharged and would not be employed at the plant again. It is understood that the employment of American labor only is being considered.

Goldfield, Nevada

May 6—The available figures show that the production of Goldfield for April was somewhat below that for March. This is due to two causes: namely, the output of the Consolidated was cut down by prospecting the walls of the Hampton stope, with the result that much low-grade material was broken. There was also a curtailment in the production from other portions of the property. Two accidents to machinery at the Florence mill handicapped the output of this plant.

The shipments from the Nevada Consolidated and Cumberland-Ely mines in April were heavier than for any month since the first unit of the mill was put in operation last July. A new record was made for a day's output—6,500 tons of ore. It is expected that the fourth unit of the concentrator will go into commission about July 15, and the plant will then be able to handle between 8000 and 9000 tons of ore daily.

There is considerable interest manifested in the control of the Mayflower-Bullfrog Consolidated Mining Company. A. C. Eisen, president of the company, has issued a call for a special meeting of the stockholders of the company to be held at the home office in Rhyolite, May 15. This action by Mr. Eisen is taken as an effort to secure control by ousting the present directors and electing a new board of his own naming.

The estimated production of Goldfield during the first week of May was: Goldfield Consolidated, \$256,000; Florence, \$25,000; Combination Fraction, \$20,000; Daisy, \$6000; and miscellaneous mines and leases, \$10,000, making a total for the week of \$317,000.

Mexico

May 5—The new mining law will probably not come up at the present session of the Mexican congress. During the recess many points in connection with the law were raised by interested parties, relating more particularly to other sections than those which were given prominence in early objections to the new law—the so-called anti-foreign clauses. Inasmuch as the law is intended to be a codification of all the existing laws and decrees, it is exceedingly broad in its scope, and touches on many points that are naturally open for discussion. It is said that the delay in enacting the law is due to the necessity of much consideration of these new points and phases. The law really includes the substance of the famous "Ordinance of Mining" enacted in 1784, for the Colony of New Spain, and continued in force practically 100 years with some important modifications in 1892. These ordinances have been pronounced by legal students as the most complete and perfect mining laws ever enacted. In the form of the enactment of the new law by Congress the old laws, based chiefly on the modifications of 1892, continued in force, and these, in the main, are very good and satisfactory to all the mining interests of Mexico, foreign and local.

Considerable capital is being invested in Mexico in mining and industrial enterprises. A deal in Santa Eulalia, Chihuahua, has just been made and last week the engineering firm of Denny Brothers, of London and South Africa, closed a negotiation for the San Martin mine at Ocot-

lan, Oaxaca, paying in the neighborhood of half a million pesos for it. The mine was developed by Frank Leonard, of Butte, Mont., who represented the interests of F. Augustus Heinze. Much of the stock was held in Mexico City. Other Canadian and English companies have secured the Greene road in Chihuahua and are planning large hydro-electric plants for northern Mexico.

London

Whether the number of accidents in mines could be lessened by employing a larger number of inspectors was the subject of a debate in Parliament during the week. The supporter of the motion urged that the official statistics understated the number of accidents that occurred and that it was only the more serious ones that were recorded. No complaint was urged against the efficiency of the mine inspectors; the demand was that their numbers should be increased so that there might be less chance of the statutory regulations being broken. The Government was also urged to assist financially in the establishment of rescue brigades with proper equipment ready to give prompt assistance in the case of an explosion. The spokesman of the Home Department, which is responsible for the proper carrying out of the Mines Regulation acts pointed out that it would be unwise to lessen the responsibility of the mine officials. Under the present system inspectors visited mines on three occasions. They made an inquiry after an accident to see if that accident had been caused by neglect and to find out who was to blame. They also visited a mine when any complaint reached them showing a *prima facie* case for inquiry, and they also made occasional visits to see that the regulations laid down by law were being observed. It was, however, recognized that, owing to the increase of mining operations and to the extended use of electricity, many new duties were thrown upon the inspectors and that, therefore, an additional staff was, perhaps, required. It was not proposed, however, to make any changes until the Royal Commission on Mines, now sitting, had presented a report, which was expected within the next few months. It was further a difficult matter to decide what class of new inspector was required, whether there should be additional men of the standing and attainments of the present inspectors, or whether another class of less highly trained men should be employed as sub-inspectors. Many of the accidents that occurred in mines are due to carelessness of the miners, which no amount of inspection can prevent. Rules are made, but are constantly broken. Many statistics were given showing the reduction in the death and

accident rate that had been made, compared with former years. One speaker said that within the last 36 years the death rate from accidents in mines had been reduced by 40 per cent., notwithstanding the greater depth and extent of the mines.

The deaths from accidents were now 1300 a year, but if they had gone on at the same rate as 40 years ago they would be over 3000 a year. The regulations and the greater scientific knowledge saved, therefore, some 2000 lives a year to the country.

In Great Britain the accident death rate was more favorable than in many foreign countries. In 1906 the death rate in France was 1.29 per 1000 employed; in Germany, 1.88, or 50 per cent. higher than in this country; in the United States 3.2 per thousand, or 150 per cent. higher. In Great Britain there has been a general decline in the death rate. In 1901 the proportion was 1.34 per thousand; in 1902, 1.23; in 1903, 1.25; in 1904, 1.24; in 1905, 1.35; in 1906, 1.29; in 1907, 1.31, and in 1908, 1.32 per cent. While these figures were encouraging, it did not mean that the actual irreducible minimum had been reached. Germany and the United States had worse statistics, but Belgium and France slightly better statistics than England.

The report of the South Crofty mine in Cornwall, which has recently been re-equipped, gives particulars of the work that has been carried on during the past year. The average grade of the ore won was 32 lb. per long ton of tin and wolfram mixed. The ore also contains a recoverable value of 2s. 6d. in arsenic, which is now refined on the mine and not sold, as formerly, as soot. The mill was one of 60 stamps and the operating expenses have been reduced to under 20s. per ton. These costs include all mine-working costs, but are exclusive of London charges and depreciation. The production has reached 28 tons black tin in the fortnight and it is hoped shortly to increase that production to 30 tons.

During the past year wolfram averaged £80 11s. 9d. and the black tin, £77 5s. 9d. The arsenic averaged £8 1s. 10d. The company is now making profits and better results are expected by the management in the future, as the mine gets opened out in depth.

In spite of the fact that particular attention is paid to the ore-dressing department, some tin appears to be getting away as an offer has been made by a tin streamer to erect a slimes-saving plant below the company's mill. This offer the company has accepted, the manager considering that the work of the streamer would be a useful check on the extraction of his own plant. The tin streamer has to pay dues on his catch and to allow the company to compete with him if they find additional plant pays.

Mining News from All Parts of the World

New Enterprises, Installations of New Machinery, Development of Mines and Transfers of Property Reported by Special Correspondents

THE CURRENT HISTORY OF MINING

Alabama

JEFFERSON COUNTY

Tennessee Coal, Iron and Railroad Company—The rail mill at Ensley has been closed down, and the date of its restarting is uncertain. Alice furnace in Birmingham is undergoing extensive repairs, and some of the coke ovens are being rebuilt; as soon as the furnace is finished it is expected that it will be put in blast. No. 1 furnace at Ensley is also being repaired. Most of the coke which would otherwise be used at the steel plant and furnaces at Ensley will be stocked instead of closing down the ovens.

Alaska

PRINCE OF WALES ISLAND

The Mt. Andrew mine is making a shipment of 2400 tons of copper ore to the Tacoma smelter. The working force at the mine has been increased to 40 men. This shipment will stimulate other important mining operations in southeastern Alaska.

Arizona

COCHISE COUNTY

Copper Queen—All the ore from the Queen properties, except the Lowell, is now being handled by the Sacramento shaft.

Calumet & Arizona and Superior & Pittsburg—The April output was approximately 4,500,000 lb. of copper.

Wolverine & Arizona—After five years' work the first shipment of 500 tons of copper oxide was made recently. The ore contained about 11 per cent. copper.

GILA COUNTY

Inspiration—At a depth of 100 ft. a body of copper sulphide was encountered. The ore is about 12 ft. thick and is said to average 3.72 per cent.

MARICOPA COUNTY

Octave—Electric hoists are being installed in place of the steam hoists now in use. The enlarged mill will be ready for operation within three months.

MOJAVE COUNTY

Gold Road—Manager J. L. Phillips expects to begin stopping on June 1, or as soon as the electric-power line from Kingman is installed. On the 500-ft. level of shaft No. 1, the development work of the past year has opened up an ore shoot 1000 ft. long and an average width of

12 ft. Chutes are being built. The grading and foundations for the new 40-stamp mill, tube mills and Butters filter process are about completed, and it is expected that the plant will be in operation Oct. 1.

Tom Reed—The new hoisting equipment at No. 2 shaft is in place, and the work of sinking will be resumed at the 250-ft. level. Contracts for grading for the foundations of a modern slime plant, to replace the present mill, have been let. The new 80-ton mill is expected to be in operation in three months.

YAVAPAI COUNTY

Yavapai Water, Oil and Mining Company—A new company recently incorporated by William Lee, Frank Pederson and others; capitalized at \$1,000,000; principal place of business, Jerome; place of operations will be near Jerome Junction, where prospecting for water and oil will be carried on. A carload of machinery is ready for delivery.

Arkansas & Arizona—The diamond drill recently purchased is being installed in the 600-ft. level, and 450 ft. from the working shaft.

North Verde—Three shifts of men are employed. This was made possible by the installation of the new Cameron No. 9 station pump, which is handling the water easily. Sinking will probably be continued to a depth of 1000 feet.

Mescal—It is confidently expected that work will be resumed during the coming month. The Arizona Power Company will, by that time, be prepared to deliver power to its consumers in this district.

Yarnell—A new company has secured this old gold mine. The 20-stamp mill will be remodeled. C. J. Price is president; T. J. Sparks, general manager.

California

BUTTE COUNTY

Bills—Quite an important strike has been made in this gravel mine on the old Blue Lead channel in Bangor district, 14 miles from Oroville.

CALAVERAS COUNTY

Bouvard Extension—Thompson & Smith have resumed sinking on this mine near Angels and the pumping plant has been increased in capacity.

Reiner—The new 20-stamp gravel mill has been completed. The Cornish pump in the shaft will be run by steam, but the

other machinery will have electric power. Superintendent John C. Benson has a large force of men at work. The channel will be drifted from the bottom of the new three-compartment shaft.

EL DORADO COUNTY

Alliance—This property near Newtown bonded to Burger, Benton and other Stanislaus county men, is having built a new gravel mill with a capacity of ten tons hourly. The body of gravel recently struck runs \$3 per cubic yard. A new tunnel is being run. Rich quartz has been found in the same vicinity by the same men.

Cambrian—This mine near Coloma, idle for several years, is to be reopened under superintendence of C. E. Seymour.

Captain Ames—This old gravel claim in Chili ravine, idle for years and supposed to be worked out, has been reopened by Marshall & Harris and they are now taking out gravel worth \$3 a carload.

Crown Point—James Richards is reopening this mine which has not been worked for some years.

HUMBOLDT COUNTY

Salmon Summit—At the annual meeting at Arcata it was decided to complete the erection of a small stamp mill and begin active development of the mines at Salmon Summit. F. A. Smith is secretary of the company.

INYO COUNTY

Red Rose and Ivanhoe—Ore is now being crushed in the arrastre of E. G. Rudolph which is driven by an overshot wheel.

Sacramento Mines Company—This company in the White mountains, 15 miles from Bishop, is having its machinery put in shape for increased development.

KERN COUNTY

Sidney Annex—Good ore is being milled. A new compressor has been added to the equipment. The mine is three miles from Johannesburg, and as owned by D. V. A. Williams.

MARIPOSA COUNTY

Sarle—The new quartz mill has been started up on ore from this mine.

MOJAVE COUNTY

Sunshine Group—Schaeur, Bassler & Laughlin, leasers, have been shipping ore to the Grigsby mill which averaged over

\$100 per ton. Drifts are being run on the vein.

NEVADA COUNTY

Nichols—The pump has been started and as soon as the mine is unwatered and some development work done, values are to be determined.

Customah—This mine at Nevada City is yielding \$40 ore at present. The shaft, now about 1000 ft. deep is being sunk deeper.

PLACER COUNTY

Three Stars—Superintendent A. Maltman has pumped out the Belmont shaft at Ophir, and as soon as the hoist is in order, will begin development work.

SACRAMENTO COUNTY

Stroup—On the new quartz mine being opened on the Uriah Stroup place near Folsom, a pump has been installed in the 135-ft. shaft, and increased development work may now be done.

Colorado

LAKE COUNTY—LEADVILLE

Iron Silver—An aerial tram is to be installed on the Tucson mine, to transport the ore 1200 ft. to Graham Park, to which point the railroad will extend the switch. A steady output is being maintained by the North and South Moyer and the Tucson mines; daily shipments are also being made from the Moyer dump.

Tenderfoot—The ore recently opened at a depth of 150 ft. has developed into a well defined shoot from which 30 tons daily are being shipped.

Big Six—Fourteen cars of iron ore were shipped last week from this property on Breece Hill.

Alps & Aztec Consolidated—It has been decided to develop the group of claims owned by this company on east Ball mountain, by means of a tunnel. The shaft on the Champion claim, however, will be continued. It now has a depth of 230 ft. Electric power is to be installed.

Silent Friend—A lateral is being driven to connect with the Yak tunnel through which the ore will be shipped.

Valley—Heavier machinery is to be installed after which the output will be doubled.

SAN JUAN COUNTY

Silverton Smelter—The old Kendrick-Gelder smelter, owned by the Ross Mining and Milling Company, has been sold to W. B. Lowe, of New York, the consideration named being \$60,000. This plant is only equipped for copper smelting but it is stated that a lead furnace is to be added and the plant put in operation this summer.

TELLER COUNTY

Union Leasing Company—This com-

pany, operating the Gold Dollar Consolidated, Prince Albert, two blocks on El Paso, Pinto, Deadwood, Mountain Monarch and North Star mines, is credited with a production during April of 2100 tons of a gross value of \$57,000.

Gold Coin—A strike is reported of 2 ft. of ore running 3 oz. in gold to the ton. This mine has produced about \$6,500,000 in the past, and is situated within the corporate limits of the town of Victor. It is now operated by 30 sets of lessees and the April output is given at 2000 tons of \$30 ore.

Modoc—Smelting ore has been encountered on the 900-level of this mine.

Drainage Tunnel—The deep drainage tunnel has now been driven a total of nearly 8500 feet.

CLEAR CREEK COUNTY

Humboldt—This property on Ute creek, has sent a \$9000 bar of bullion, the product of a 30-day run, to the Denver mint.

Gem—A strike of 18 in. of high-grade silver-lead ore was made on this mine which is worked from the Newhouse tunnel.

Silver Horn—A body of gray copper ore, running high in silver, has been disclosed in an old stope in this mine on Ute creek.

Burns-Moore Tunnel—It is expected that this tunnel, the portal of which is in Chicago creek, and which is already driven 4000 ft., will during this year tap the Silver Horn and other former large shippers that closed down on account of the large volumes of water encountered.

Georgia

BARTOW COUNTY

Pittsburg-Bartow Mining Company—This company controls a tract of 600 acres of ore land and has practically completed the necessary construction work for active mining, including a tippie and sidings and the installation of loading and mining machinery. The plant has also been equipped with pumps and pipe lines, as the ore is such that some washing is required. The mine will be open-pit. The company expects to be shipping ore about the middle of May. For the present the company will sell its product as merchant ore to southern furnaces, but eventually other manufacturing operations are expected to be carried on. Thorough soundings and investigations of the deposits have been made and these show that a large block of ore is in sight. Geo. M. Koehnline, Wheeling, W. Va., is president and general manager of the company, and Walter Kennedy, Pittsburg, is serving as consulting engineer.

Idaho

SHOSHONE COUNTY

Black Horse—A 12-in. vein of rich zinc

ore was encountered in a drift 400 ft. from the end of a 900-ft. tunnel.

Blue Bell—A contract was let recently for another 100 ft. of drifting.

Bunker Hill—A suit was recently commenced against this company by the Springston Lumber Company for the recovery of the value of certain logs alleged to have been appropriated by the mining company.

Pittsburg Lead—The suit of Joseph P. Keane against the Pittsburg Lead Mining Company involving the ownership of 20,000 shares of stock has been decided in favor of the defendant. A notice of appeal has been served.

Sheridan—Fourteen inches of good milling ore was recently opened at a depth of 200 feet.

Monarch—It is reported that the 75-ton. mill will be increased to one of 250 tons. capacity. To date nearly 1000 tons of concentrates have been shipped.

Indiana

SULLIVAN COUNTY

In a formal sale of the John R. Walsh and J. K. Seibert mining properties in this and Greene county, the bondholders represented by the Equitable Trust and Savings Company, of Chicago, purchased the property for \$1,500,000. The bid made by the bondholders was the only one, the only other formidable competitor, the United States Steel Corporation, having been blocked from the deal.

The sale was made at 10 a.m., May 1, on the court-house steps in Sullivan, and the deal was consummated soon afterward. The sale includes more than 15 of the best mines in the territory, and the name will be changed from the Indiana Southern & Southern Indiana Coal Companies, to the Alliance Coal Company. The new company will have complete control of more than 20,000 acres of valuable coal lands in Sullivan and Greene counties.

Michigan

COPPER

Lake navigation has opened after an extended blockade by ice at the Soo. Boats are at the Calumet & Hecla docks, and also the Copper Range, loading with copper.

Michigan—The old adit on the Bee tract has been driven about 80 ft. and throughout its length good copper ground has been revealed. This opening lies about 2500 ft. east of "C" shaft and the strike is about 90 ft. north of the Calico vein.

Mass—It is planned that within 3 months the mine will be able to ship about 500 tons daily to the mill.

Lake—Drifting at the end of the cross-cut driven from the 3d level to open the

formation is underway. This drift is in 70 ft. and shows a very fine state of mineralization throughout. The north drift from the second level is also in good ground. It is expected that in the near future this company will issue 10,000 shares of stock at \$25 per share to provide working capital.

Adventure—This company has decided upon the site for its new shaft to expose the three lodes that were cut by the drill cores. All the necessary machinery to handle this work is on the ground and sinking will be under way early in May. It is proposed to sink this shaft vertical until the first lode is cut, and then turn the shaft to conform with the pitch of the vein.

Almceek—The two new shafts are down over 200 ft. and are sunk at an angle of 80 deg. until the lode is reached, when they will turn to the angle of the formation. They start from a central point and diverge. It is expected that the Kearsarge lode will be cut at about 1200 ft. The lower levels of the two producing shafts are encountering some fine mass and heavy stamp copper. These shafts are equipped with a very efficient skip-loading device. On a trial run recently 148 five-ton skips were hoisted in eight hours. The framework of the stamp mill is completed and the building is rapidly being inclosed and, barring some unforeseen delays, will be ready to handle rock early the coming fall.

Elm River—The report for the year ending March 31, 1909, states that the development work during the year was 750 ft., in shafts and crosscuts. The treasurer's report Jan. 1, 1909, shows mining and general expenses, \$34,984; receipts from interest and rent, \$3,402; balance on hand, \$54,760.

Tamarack—At the annual meeting, May 6, the management was transferred to the Calumet & Hecla Mining Company by the election of a new board of directors as follows: Rudolphe L. Agassiz, Quincy A. Shaw, George A. Flagg, Alexander Agassiz, Francis W. Hunnewell, Francis L. Higginson and James McNaughton.

New Arcadian—The new company has filed articles of association. The formal transfer of the Arcadian property to the New Arcadian will be made within the next few days.

North Lake—This company has exposed three copper bearing lodes on its lands by means of drill cores, one lode being 30 ft. thick and showing about 10 ft. of good copper rock.

Atlantic—This company continues sinking its Section to shaft and a depth of about 2200 ft. has now been obtained. No material change is being noticed in the character of the formation. Several of the drifts are in nearly 500 ft. from the shaft without encountering any consistent run of paying ground. The best

showing to date had been made in the lateral openings from the 13th and 15th levels.

Missouri

ST. FRANCOIS COUNTY

The strike of the miners for an advance of 30c. per day has spread to all the mines in the Flat River lead district, excepting the Deslodge and National Lead Company mines. As the Miners' Union is not well organized in this district, the strike is not expected to last long; thus far the men have been quiet and peaceable. Many of the old miners are leaving for Joplin and other mining camps.

Montana

BUTTE DISTRICT

Amalgamated—Trouble with the gases generated by smouldering fires in the old stopes of the Anaconda Copper Company properties has increased within the past week. Operations have recently been practically suspended in the Anaconda, St. Lawrence, Neversweat and Parrot mines on account of the gas. At the annual meeting of stockholders of the Boston & Montana Mining Company, held recently in Butte, the following were elected directors for the ensuing year: Sidney Chase, John D. Ryan, B. B. Thayer, David B. Hennessy and Andrew B. Grafius.

Butte Central Copper Company—Work on the Ophir claim, preparatory to the resumption of operations, has been started. It is expected that by June 1 the work of sinking the shaft from the 500- to the 1000-ft. mark will be started.

BEAVERHEAD COUNTY

Gilmore & Pittsburg Railroad—The road is being built between Armstead, in Beaverhead county, and Gilmore, Idaho. Two locomotives and about 20,000 tons of steel rails have recently been ordered. It is possible that the road may be in operation by Jan. 1, 1910.

FFEGUS COUNTY

Cumberland—A. S. Wright has secured an option on this property, situated at Maiden.

GALLATIN COUNTY

Gallatin Valley Electric Railway—Some work has been done on the grading for the new road. Charles B. Anderson, secretary of the company, is in Spokane for the purpose of purchasing machinery.

Storrs Mines—E. A. Bartel has secured a lease on the coal mines of the Amalgamated Copper Company at Storrs, and will begin operations within a short time. The mines have been closed down for several months.

GRANITE COUNTY

Hell Gate Coal Company—This com-

pany has recently been incorporated with a capital stock of \$250,000. The properties are situated at Hell Gate. The following are the incorporators, all being residents of Missoula, Montana: Henry L. Shapard, William W. West, John J. Murphy, John E. Kane, Joshua Fleming, William Crawford and Walter W. Murphy.

MISSOULA COUNTY

Monitor—This property, situated at Saltese, has been closed down for the last two months. It is reported that operations will be resumed by June 1.

Montana-Clinton Company—This company has recently been organized to take over the property of the old Triangle Mining and Development Company, situated at Woodville gulch.

Neveda

ESMERALDA COUNTY—GOLDFIELD

Florence—The ore reserves are constantly being increased by new discoveries showing high grade, milling and shipping ore. The production of the mill for the month of April was lower than previously estimated due to accidents to machinery.

Consolidated—A shipment of one carload a day of high-grade ore is being made from the Hampton stope, one carload consisting of 33 tons gave returns of 72.84 oz. gold per ton.

ESMERALDA COUNTY—HORN SILVER

Great Western—In the winze being sunk from the 300-ft. level, 3½ ft. of ore was discovered last week. The mine is maintaining its regular shipment of three carloads per week.

De Lotie Lease—A shipment of 16 tons of ore will be sent out this week.

Horn Silver Townsite Company—A contract was made last week for the sinking of a well. It is expected that a good supply of water will be obtained at a depth of 700 feet.

NYE COUNTY—BULLFROG

Montgomery-Shoshone—A body of good gold ore was recently opened between the third and fourth levels from which shipments are now being made. Stopping is carried on at the 500 level of the Polaris vein, from which a good grade of milling ore is being taken. Two machines are at work in the Glory Hole, the boundaries of which have not been reached. Additions are being made to the mill equipment and more machinery is expected to arrive about May 20.

NYE COUNTY—PIONEER

Pioneer Lease—Shipments of ore are maintained at the rate of 75 to 100 tons per day. At present six machine drills are being operated, two on the 150-ft. level and the remaining ones in the big stope on the lower level. The 12-drill

compressor plant has arrived and is being installed.

NYE COUNTY—TONOPAH

MacNamara—The main shaft was completed to a depth of 790 ft. April 25, and last week a station was cut at the 775-ft. level; a crosscut was started for the vein which was recently cut by the shaft.

Montana-Tonopah—The crosscut in the foot wall of the Triangle vein in the stope from the 390-ft. level has developed between three and four feet of high-grade milling ore. The drift on the Martha vein on the 515-ft. level is in continuous ore, with occasional bunches of high grade. The mill is making an extraction somewhat under the average, due to oxidized ore. Several improvements are now under way which it is thought will remedy this defect.

New Jersey

SUSSEX COUNTY

Lafayette Slate Company—This company has been incorporated to work the slate quarry at Lower Lafayette. The office is in Newton, and the incorporators are A. J. Graey, L. H. Morris and F. R. Snyder. The quarry has been opened for some years; the new company will extend the workings.

North Carolina

ASHE COUNTY

Standard—The Standard Mining and Milling Company was recently incorporated at Asheville. Capitalization, \$20,000. Incorporator, R. S. Smith.

CHEROKEE COUNTY

Alba Mineral Company—This company was recently chartered at Kinsey to acquire and develop mining property. Capitalization, \$10,000. Harold Smith, of New York, and others are interested.

CLEVELAND COUNTY

Catawba—Work is being done at the old Catawba gold mine near King's mountain. It is reported that a movement is on foot to resume work at the old tin mines in this vicinity.

JACKSON COUNTY

Consolidated Nickel—Machinery for this mine is now being freighted from the railroad. A 900-h.p. Corliss engine is being installed. The power house is 95x95 ft.; boiler room, 50x50 ft.; ware-room, 80x30 ft. Work of construction is under the direction of A. S. Watson and J. G. Van Hurst, of New York. G. A. Adams is head of the company.

South Carolina

ABBEVILLE COUNTY

Saluda Copper Company—It is reported from Anderson that work is actively being carried on at this property. The mine is

near Donalds. A consignment of machinery has been received.

CHEROKEE COUNTY

Flint Hill Mining Company—This is a new company recently organized at Gaffney with a capital of \$250,000. L. U. Campbell is president and general manager. It is reported that a system of modern machinery will be installed at an early date.

South Dakota

CUSTER COUNTY

There is now little doubt that tin mining on a large scale will be carried on in the Black Hills, provided careful prospecting and development bear out previous indications and reports. The Harney Peak Tin Mining, Milling and Manufacturing Company has been reorganized under the laws of Maine. Dr. A. R. Ledoux, for 15 years receiver for the old company, has been given the management under the new company.

LAWRENCE COUNTY

Lucky Strike—On May 5 the new mill was started. Twenty of the 30 stamps are now dropping and the management reports enough ore in sight to insure continuous running at full capacity.

Utah

JUAB COUNTY

Tintic Central—As soon as the power plant completes its connections, the new hoisting plant will be put in operation. The shaft is now at a depth of 235 feet.

East Tintic—The new plant, consisting of a 50-h.p. engine, 100-h.p. boiler, 5-drill compressor and a 50-light electric plant is now in full operation. Work has been started in the shaft and stations will be cut at the 130- and 230-ft. levels.

McKinley—The stock of this company will soon be listed on the Salt Lake Exchange. A winze is now 75 ft. below the 500-ft. level, and the shaft is to be continued and crosscutting done on the lower levels. The property is situated west of the Centennial Eureka mine.

Beck Tunnel—The ore, now being sent to the smelter is taken from the old workings and from the 300-ft. level of the new workings.

Virginia

TAZEWELL COUNTY

Big Vein Pocahontas Coal Company—This company has leased the Browning properties and will extend the present workings, putting up new buildings and machinery. The company was recently organized in Baltimore; A. D. Macfarland is engineer in charge at the mines.

Washington

Col. C. Christopher and associates of Seattle have purchased, from the State

Mining and Smelting Company, the patent rights of the Cotton matting furnace for the States of California, Oregon, Nevada, Arizona and New Mexico.

LEWIS COUNTY

Mendota Coal and Coke Company—Twenty dwellings are to be erected for the use of the employees at the mine at Tono. The camp will have a water system, school house and other improvements, thus indicating a permanency of coal-mining operations at this point.

Wyoming

CARBON COUNTY

United Smelters, Railway and Copper Company—Treasurer I. N. Nennock announces that more than 85 per cent. of the outstanding stock of the Penn-Wyoming has been sent in and exchanged for securities of the new company. This means that more than \$7,500,000 par value of the Penn-Wyoming stock is now owned by the new company. The Penn-Wyoming is capitalized at \$10,000,000, but of this only \$8,963,000 was issued.

Philippine Islands

BENGUET

Benguet Consolidated Gold Mining Company—This company reports for February a production of 150 oz. gold and 200 lb. cyanide bullion.

Paracale Gold Dredging Company—The dredge returns for February show a return of 630 oz. gold.

Philippine Gold Dredging Company—The new dredge of this company is now being installed on the Paracale river, above that of the Paracale Dredging Company.

CAMARINES

Much prospecting is going on, according to the *Far Eastern Review*, of Manila, and the indications are that there will be much activity in placer mining this year.

Delabaybay Dredging Company—The machinery for the gold dredge has been received, and is being put together.

San Mauricio—Preliminary work is being done for the 20-stamp mill at Mambulao. The old workings in the mine have been cleared out and retimbered. About 1500 ft. of development work has been done.

Tumbago—Preparations for active work are well advanced. The old workings have been cleared out and are being extended. A five-ton Huntington mill will soon be ready to run. A stamp-mill will be added later, if results prove as favorable as expected.

Canada

ALBERTA

Canadian-American Coal and Coke Company—General Manager Muller, at

Frank, is opening two levels from the shaft sunk earlier in the year, at 240- and 350-ft. depth, respectively. The headings are in a seam of clean coal varying from 10 to 14 ft. in thickness. These new workings will add 200 tons per day to the output, making about 700 tons in all.

BRITISH COLUMBIA

G. O. Buchanan, of Kaslo, supervisor of lead bounties for Canada, has announced that the total amount earned as bounty on lead mined in Canada during the fiscal year ended March 31, 1909, is \$307,433, this representing the bounty paid by the Canadian government on an output of 41,986,475 lb. lead. Revised official figures show a production of nearly 43,200,000 lb. of lead in British Columbia in the calendar year 1908.

BRITISH COLUMBIA—LARDEAU

Ferguson Mines, Ltd.—F. C. Merry, of Ferguson, superintendent, has resumed shipment of ore from the Silver Cup mine, navigation on Trout lake being once again practicable after the winter freeze-up. Last year's output was about 1560 tons averaging more than 100 oz. silver per ton and nearly 30 per cent. lead.

BRITISH COLUMBIA—NELSON

Eureka—After tunneling about 700 ft. about 10 ft. of good copper ore has been encountered at a depth of approximately 300 ft. below the surface.

ONTARIO—COBALT DISTRICT

Ore Shipments—Shipments of ore from Cobalt for the week ended May 1 were: Buffalo, 44,620 lb.; Cobalt Central, 43,270; Chambers-Ferland, 30,000; La Rose, 254,500; McKinley-Darragh, 57,340; Nipissing, 120,660; O'Brien, 128,018; Temiskaming, 132,800; Trethewey, 191,988; total, 1,013,196 pounds.

La Rose—The number of men employed is 260, and large additions to the force will be made during the next few weeks, when active development of the Lawson, Princess and University is undertaken. Very rich ore is being taken from No. 3 shaft, averaging 10,000 oz. to the ton. The vein at the bottom of the shaft shows 5 in. of this grade in addition to wall-rock rich in native silver. A raise has been made from the level in MacDonald tunnel 80 ft. to the surface and stoping has been started.

YUKON

The new Herbert district, tributary to Forty-Mile, including also Little Dome creek, is also the scene of much activity as indicated by the applications at the gold commissioner's office for ground. A good development is predicted.

Yukon Basin Gold Dredging Company—A gold dredge with a capacity of 3000 cu.yd. per day, for use in the Klondike, has been shipped from Vancouver, B. C., to Skagway, Alaska, whence it will be

taken to its destination on Stewart river. It is of a New Zealand type, was manufactured in Glasgow, Scotland, and prepared for shipment north at Vancouver. The company has large concessions along Stewart river.

Mexico

CHIHUAHUA

Parral Output—The production of the camp for the week ending April 30 was 9120 tons, of which 5650 tons were of milling grade and were treated locally.

New Camps—Two new camps, the Vallecillo and Real de Nogales, in the municipality of Zargosa, Hidalgo district, readily reached from Parral, are giving considerable promise. The former shows ores of copper-gold content and the latter lead-silver.

Rio Plata—The report of March operations contains the following items; Net returns on shipments of concentrates and crude ore, \$26,671; operating expenses, \$8000; paid account mine indebtedness, \$18,670 leaving an indebtedness of \$31,275 on the mine.

Mexicana—Geo. B. Jacobs and associates are sending out from this mine in the Cerro Colorado section, near Ahumada, a small tonnage of high-grade lead-silver ore. It is the intention to install machinery shortly.

MEXICO

Mexico Mines of El Oro, Ltd.—Report for April: Yield of bullion, \$110,120; total expenses, \$45,540; profits, \$64,570; expenditures on permanent improvements, \$1000; net value of 20 tons shipped during month not included in the above profit, \$6570.

El Oro Mining and Railway Company, Ltd.—Report for April: Yield of bullion, \$215,190; total expenses, \$130,410; profit, \$84,780; profit on railway, \$4000; total profit, \$88,780; expenditures on permanent improvement, \$8000.

Central America

COSTA RICA

Aguacate Mines—At these mines, San Mateo, a 100-stamp mill is being erected under charge of Thomas D. Murphy. The Pardy Engineering Company is putting in a hydroelectric plant, which is expected to furnish 4500 h.p. The mines are in charge of A. M. Yonge as general superintendent.

Africa

RUHESIA

Gold output in March was 48,030 oz. fine, being 2286 oz. more than in February; for the three months ended March 31, the total was 142,395. By values the reported production was \$2,879,275 for the first quarter of 1908, and \$2,916,692 in 1909; an increase of \$162,583 this year.

Other production reported in March in-

cludes 20,454 oz. silver, 72 tons lead, 9 tons copper, 2730 tons chrome ore and 24 tons asbestos. Coal mined was 11,859 tons.

TRANSVAAL

The mine labor report for March shows that at the close of the month there were at the mines 162,043 negro laborers and 9997 Chinese. This was an increase of 4205 negroes and a decrease of 37 Chinese during the month. As compared with March, 1908, there was an increase of 32,183 negroes and a decrease of 16,507 Chinamen. The new laborers coming to the mines at present are chiefly from Portuguese territory.

The gold production of the Transvaal in April is reported at 607,100 oz. fine, a decrease of 399 oz. from the March report. For the four months ended April 30, the total output was 2,242,992 oz. fine in 1908 and 2,395,432 oz.—or \$49,513,579—in 1909; an increase of 152,440 oz. this year.

WEST AFRICA

Gold production of the Gold Coast and Ashanti in March, is reported at 23,186 oz. bullion, being 1783 oz. more than in February. For the three months ended March 31, the total was 76,924 oz. bullion in 1908, and 67,406 oz. in 1909; a decrease of 9518 oz. The bullion reported this year was equal to \$1,318,270, or 63,777 oz. fine gold.

Australia

NEW SOUTH WALES

Broken Hill Proprietary Company—In the controversy between this company and its men, the company has given notice of an appeal. The appeal is not against the schedule of wages fixed by the Conciliation and Arbitration Court, for the law does not permit of objection on that score. But the court included in its award the decisions regarding two matters extraneous to the plaintiff. First, that the number of shifts at Port Pirie be reduced from seven to six per week; and, secondly, that there shall be no extension of the contract system beyond the point to which it is at present applied. The hearing on this appeal was expected to delay for some time the resumption of work.

New Zealand

The Mines Department reports the exports of gold in February at 41,265 oz. For the two months ended Feb. 28 the total was 92,515 oz. bullion in 1908, and 77,230 oz. in 1909; a decrease of 15,285 oz. The bullion reported this year was equal to \$1,507,285, or 72,923 oz. fine gold.

Exports of silver for February were 154,258 oz. For the two months the silver reported is 244,593 oz. in 1908, and 198,084 oz. in 1909; a decrease of 45,910 oz. this year.

Current Prices, Market Conditions and Commercial Statistics of the Metals, Minerals and Mining Stocks

QUOTATIONS FROM IMPORTANT CENTERS

Coal Trade Review

New York, May 12—Coal trade in the West continues to advance, though still rather slowly. The Lake trade is still in some doubt, owing to the late beginning of shipments and also to the controversies over rates on coal to Lake Erie ports, which are still unsettled. The demand for steam coal, however, is undoubtedly better than it was a month or so ago, though the trade is still backward enough to cause sharp competition for orders.

It is reported that the Steel Corporation has decided after all to make a large quantity of coke at Gary for the use of its plants there. It is also understood that the Corporation has secured control of a number of Indiana mines for the purpose of supplying the coal for use in that plant.

In the East the bituminous trade is less active than in the West and there is a good deal of complaint about the dullness in Seaboard territory and New England.

The report that the Pennsylvania Railroad has secured the stock in the Chesapeake & Ohio, which has been on the market for some time has tended to quiet the discussion over the competition of West Virginia coals in the Seaboard trade. It is generally believed that with the Norfolk & Western and the Chesapeake & Ohio both under Pennsylvania control, rates will be equitably adjusted. The Virginian railway, whatever it may do in the future, is not yet in a position to make heavy shipments.

The anthracite trade, now that all strike troubles are over, has settled down into the quiet usual at this season. Domestic trade is fair and the companies are preparing for the usual summer shipments to the West. An incident in this trade is the reported cutting of prices at Springfield and other leading points in the central part of New England. The trade there has been mainly in the hands of the New York, Ontario & Western, which is controlled by the New York, New Haven & Hartford company. It is said that this company has resented some attempts of the Erie to secure trade in what it has regarded as its special territory and has cut quotations accordingly to drive out the so-called intruders. This action is rather characteristic of the New Haven company.

Ohio Railroads and the Hepburn Law—The Interstate Commerce Commission has been making an investigation into the

ownership of coal-mining companies by the Hocking Valley and other Ohio and West Virginia railroad companies; also into some charges of discrimination in coal rates and shipping facilities on those roads.

COAL TRAFFIC NOTES

Tonnage originating on Pennsylvania railroad lines east of Pittsburgh and Erie, year to May 1, short tons:

	1908.	1909.	Changes
Anthracite.....	1,798,691	1,778,316	D. 20,375
Bituminous.....	10,886,619	11,716,037	I. 829,418
Coke.....	2,326,077	3,306,992	I. 980,915
Total.....	15,011,387	16,801,345	I. 1,789,958

The increase for the week was 192,233 tons. Total increase, year to date, was 11.9 per cent.

Anthracite coal shipments in April were 5,891,176 long tons, being 441,198 tons less than in March. For the four months ended April 30 the shipments were, in long tons:

	1908.	1909.	Changes.
Reading.....	3,911,998	4,656,959	I. 644,961
Lehigh Valley.....	3,500,040	3,551,618	I. 51,578
N. J. Central.....	2,735,067	2,734,096	D. 971
Lackawanna.....	3,176,498	3,179,787	I. 3,289
Del. & Hudson.....	2,279,469	2,239,202	D. 40,267
Pennsylvania.....	2,023,907	2,070,596	I. 46,689
Erie.....	2,337,552	2,694,373	I. 356,821
N. Y., Ont. & West.	910,943	967,368	I. 46,425
Total.....	20,875,474	21,982,999	I. 1,107,525

The total increase this year was 5.3 per cent. Six companies showed gains, those of the Philadelphia & Reading and the Erie being the largest. Two companies—the Delaware & Hudson and the Central Railroad of New Jersey—had decreases, the latter being very small.

New York

ANTHRACITE

May 12—Trade at present is dull, owing to the fact that many large consumers laid in extra stocks during March in anticipation of a possible stoppage of production. Now that the labor troubles are settled they will use up these stocks before purchasing more coal. Quite a number of the collieries in the anthracite region are running short time, and this condition may last for a month or more.

Prices on domestic sizes are \$4.35 for lump and \$4.60 for egg, stove and chestnut, f.o.b. New York harbor. For steam sizes current quotations are \$3.10@3.25 for pea, \$2.35@2.50 for buckwheat, \$1.70@2 for rice, \$1.25@1.50 for barley, f.o.b. New York harbor. Washery pea can be had for 5 or 10c. less.

BITUMINOUS

The Seaboard bituminous trade is unmistakably dull. Few orders are coming

from the far East, although most people believe that that section is pretty near bare of coal. Along the Sound there is a regular business, but it is much smaller in amount than is usual. New York harbor is rapidly becoming a dumping ground, where purchasers are watching for bargains in the way of cheap coal. Prices continue unchanged. All-rail trade continues about on the same level as for several weeks past. Transportation is good and car supply abundant.

There is some inquiry for coal for outside shipments to Southern ports, chiefly Gulf ports, and a fair quantity of coal is being sold for such shipments.

In the regular Coastwise trade there is not much doing, and vessels are in good supply, being inclined to hunt for cargoes. Rates for large vessels from Philadelphia are: To Boston, Salem and Portland, 55c.; Portsmouth, 70c.; Lynn, Newburyport and Bangor, 75c.; Providence, New Bedford and the Sound, 55c. per ton.

Birmingham

May 10—The Alabama coal market is still dull and the production is about 50 per cent. off. Some of the principal mines of the State are running on half-time, while some of the commercial mines are on less. There is much complaint among the mine workers. Sales agents of coal companies are working hard in the pick-up orders but they are not so easily found. The coke demand is steady in the furnace quarters. Foundry coke is in fair demand. The coke production holds up fairly well.

Chicago

May 11—Cool weather following a spell of summer temperature has helped the domestic trade in the last week, and steam consumption fully holds its own. The interest of the trade is largely in contracts, many of which are being made at low prices; this assures a good movement of coal, and open-market conditions will continue to dominate the trade. The general supply is so well regulated that demurrage evils are largely suppressed, while confidence of consumers increases.

Illinois and Indiana coals are unchanged in price, carlots of lump and egg selling at \$1.75@2.25; run-of-mine at \$1.65@1.75 and screenings at \$1.40@1.70. Eastern coals are in good condition, only Hocking showing some over-supply and selling at \$2.85@3.15. Smokeless is in steady demand at \$3.30@3.45 for lump and \$2.95@

3.05 for run-of-mine. Youghiogheny is steady at \$3.15 for 34 in. lump and Pittsburg No. 8 somewhat dull at \$2.75@2.85. Anthracite is selling well under the stimulus of the cool weather and generous advertising of April prices.

Cleveland

May 11—Lake coal trade drags yet, the shipments being slow. There is much interest in the controversy over freight rates to Lake ports. The strike is making a good deal of noise, but does not seem to delay the sailing of vessels.

Domestic trade is naturally slow, but there is some buying by dealers. Massillon is quoted at \$2.30 for lump and \$2.15 for run-of-mine at mine.

Steam coal is more active and sales are larger. Slack is in rather good supply. Ordinary grades of steam coal sell at \$1.35 for lump and \$1.10 for run-of-mine, at mines; smokeless, \$1.50 and \$1.20 at mine. Kanawha coal is offered here at \$1.35 for lump and \$1 for run-of-mine at mine.

Indianapolis

May 11—The change in ownership of the John R. Walsh coal companies—the Indiana Southern and the Southern Indiana—which were sold under order of court a week ago, will mean a resumption of work in at least a score of mines in Sullivan and Greene counties within the next four weeks. The mining property was bought by Chicago men, who are said to be identified with both the Steel Corporation and the Illinois Central railroad. Either the Steel Corporation, it is reported, will take over about 15 mines, or will place large contracts for coal to be used in the Gary plant with the mines in question. In either event, resumption of work in mines that have been idle for the past two years is certain. The Illinois Central has made offers for mines at Farnsworth, Dugger and Linton, on the line of its Indianapolis-Effingham branch.

The general mining situation in Indiana is far better, as a whole, than for a year or more.

Pittsburg

May 11—Lake shipments are light, as very little ore is coming down. One ore and coal interest has been making fair shipments, while the railroads are shipping some coal across the Lakes. Prices continue low and unsatisfactory, and the market is a trifle weaker than it was a fortnight ago. Ordinary lots of mine-run are selling at about \$1.10, while on large lots \$1 is done and occasionally shaded. Slack remains at 55 to 65 cents.

Connellsville Coke—It is regarded as certain that the Connellsville coke merger will be put through, but it will not include all the independent interests. The project is backed by two Pittsburg banks which

can swing the deal without difficulty. While on the surface the project is merely one to consolidate independent coke interests, it is believed in well informed quarters that the real motive in the operation is to get the coke operations together to form an adjunct to the consolidation of independent steel interests which has been worked upon in a more or less desultory fashion for about six months.

Standard Connellsville furnace coke is selling at \$1.50@1.60 for prompt shipment, while \$1.75@1.90 is quoted on second-half contracts. Spot foundry coke is held at \$1.75 and contract at \$2@2.25.

The *Courier* reports the production in the Connellsville and lower Connellsville fields at 220,507 tons, a drop of less than 1000 tons from the previous week. Shipments were 9061 cars, an increase of 76 cars, and divided as follows: to Pittsburg district, 3972 cars; to points west of Pittsburg, 4249 cars; to points east of Connellsville, 840 cars.

Foreign Coal Trade

Belgian Coal Trade—Imports and exports of fuel in Belgium, three months ended March 31, metric tons:

	Imports.	Exports.	Excess.
Coal,.....	1,400,670	1,189,385 Imp.	211,285
Coal, 1908...	1,139,121	1,060,805 Imp.	88,316
Coke,.....	71,404	260,773 Exp.	189,339
Coke, 1908...	94,472	202,177 Exp.	107,705

The chief imports are from Germany and Great Britain; the chief exports to France.

Welsh Coal Prices—Messrs. Hull, Blyth & Co., London and Cardiff, report current prices of coal as follows, on May 1: Best Welsh steam, \$3.90; seconds, \$3.78; thirds, \$3.60; dry coals, \$3.66; best Monmouthshire, \$3.60; seconds, \$3.48; best small steam, \$2.88; seconds, \$2.52. All f.o.b. shipping port. This is a sharp advance on all coals, varying from 18 to 24c. per ton.

Iron Trade Review

New York, May 12—The iron and steel trades continue to show a fair degree of activity. In various lines this amounts to a strong business, though in others there is still some lagging.

Pig-iron orders have increased in volume of individual orders and in the aggregate. Some foundries, quite a number in fact, are placing orders running into the third quarter and are showing a degree of confidence in future business which has not been manifested for a good while. Some large orders for basic iron have also been placed within the week. Pig-iron business has been more active in Eastern territory than in the West, however. The furnaces have accordingly stiffened somewhat in their views. They are not attempting to advance prices on current business, but are less inclined to

make concessions; and many are asking a little higher price for third quarter deliveries than for spot iron.

In finished material structural steel continues the most active section of the market. A good business is also being done in bars, and the demand for plates is improving. Wire and wire products have been active since the reductions in price announced last week.

One large order for rails has been announced, the Chicago, Milwaukee & St. Paul Company having placed a contract for 63,000 tons of standard section with the Steel Corporation. The rails are to be rolled by the Illinois Steel Company. It is stated that the order was taken at the old price of \$28 per ton, which would contradict the report that lower prices were to be made on rails. The business in light rails is increasing and the principal companies making them have advanced their prices \$2 or \$3. Recently there has been considerable competition for these orders and some had been taken as low as \$22 per ton.

Pig-iron Production—The reports of blast furnaces, as collected by the *Iron Age*, show that the aggregate weekly capacity of the coke and anthracite furnaces in blast on May 1 was 413,700 tons, an increase of 4500 tons over the report for April 1. Making allowance for the charcoal furnaces, the production of pig iron in April was, approximately, 1,755,000 tons; for the four months ended April 30 it was 7,182,000 tons.

Electric Iron and Steel—The installation of Heroult electric furnaces in the Pit River district in California is reported to be past the experimental stage and ready to begin the smelting of iron and steel on a commercial scale. It will be the first working plant of the kind in this country.

Baltimore

May 11—Imports for the week included 4188 tons cupreous pyrites and 7835 bars converter copper from Spain; 17,700 tons iron ore from Cuba.

Birmingham

May 10—The pig-iron market in this section appears to be as strong as it was a month ago, if not stronger. There are some sales still being made and prices continue to hold strong, at \$11.50@12, No. 2 foundry, the first named price being the minimum, with the latter secured by more than one furnace company. An estimate is made that over 450,000 tons of iron have been sold by Southern iron manufacturers since the middle of March. While much of this iron was sold at \$11, it will mean steady operation for some time to come. The Tennessee company blew in two of its Bessemer, Ala., furnaces the past week and will have two

more ready in the Birmingham district before the end of the month.

The cast-iron pipe concern in this district continue to secure business.

The steel plant at Ensley is being repaired. It is not believed the shut down will be long lived. Three thousand men were thrown out of steady employment, though many of the number are being employed in other parts of the district.

Chicago

May 11—The pig-iron market is unmarked by any change of importance, but evidently is strengthening day by day. Southern holds firmly up to \$11.50 Birmingham (\$15.85 Chicago) and on some sales for delivery late in the year \$12 is obtained. Most of the buying is in small lots—up to 500 tons—but occasionally a 1000-ton lot is taken. Melters are as yet cautious about contracting for large supplies ahead. The increasing movement of iron and steel products has much to do with restoring confidence. Northern iron sells evenly at \$16.50@17 for third-quarter delivery and with every prospect of increased demand. Both Northern and Southern appear to be settling into something of the usual summer quietness. Lake Superior charcoal iron is firm and quiet at \$19.50@20.

In finished products general conditions are bettering. Lower prices have brought about large sales, railroad supplies and structural material especially showing improved demand.

Coke remains at \$4.70 for the best Connellsville, with sales increasing but supply abundant.

Cleveland

May 11—An increased movement of ore from docks is noted. Nothing definite has been done as to new ore prices, and it begins to look as if there would be no change from last season. The unions have not yet succeeded in stopping vessels ready to start up the Lakes.

Pig Iron—Many small sales are being made, which foot up a big total tonnage. Furnaces are stiffer in their views and are not making concessions. Prices are about on a basis of \$15@15.25 for No. 2 foundry.

Finished Material—There is a good trade in bars and structural steel. Plates are selling better, especially in small lots.

Philadelphia

May 12—The pig-iron market has developed a good deal of activity during the last few days. The heavy sales recorded at Southern furnaces have indirectly helped this market and in some instances makers are asking a trifle more money than a week ago. Basic iron is stronger than any other kind. Foundry, especially No. 2, has been taken quite freely, though in small lots. The mills continue to buy forge iron in a moderate

way at 15c. Basic is quoted at the same price. Two or three good-sized lots of malleable iron were taken Monday. Special brands were quoted today for quick delivery 50c. higher than a month ago. The sentiment among furnace interests here is that there will be no more serious competition from the South.

Plates—A large business has been done in steel plates in the Pennsylvania mills.

Structural Material—A general improvement in structural material has set in and a large volume of business has been transacted, concerning which office men do not care to give any details. Orders for bridge-building material are dropping in every day or so.

Pittsburg

May 11—Another advance of \$1 per ton has been made in bars, plates and shapes, making bars 1.20c. and plates and shapes 1.30c. These prices are now the minimum of the market for any delivery, and are not being made in any case for delivery beyond Jan. 1. The advance was made independently by the different producers. The first advance, about three weeks ago, was not a general one, as it represented rather the withdrawal of special prices by producers who had been most eager for business.

The latest advance puts the market on bars, plates and shapes back to where it stood immediately after the February break. However, it is less than three months since then and it is regarded as favorable that the market found bottom and made a partial recovery so soon.

The great bulk of the agricultural-implementation business in steel bars has been placed, the latest business being booked last week, just before the advance. Usually this business is placed at a flat price, for deliveries July 1 to June 30, but this year the minimum prices were made only to Jan. 1, all contracts calling for some kind of an advance for 1910 deliveries, the price in some cases \$1 per ton; while in other cases it was stipulated that the price should advance with the market, but not above a stipulated price.

A considerable part of the buying of finished-steel products in the past few weeks has been of a more or less speculative character, and one of the motives of the mills in advancing prices was to check this tendency.

Pig Iron—Basic iron is quoted at \$14. Valley, for early delivery and has not been over-firm at that figure, while it is impossible to obtain an advance for delivery in the second half. Bessemer has been a trifle weak, and has sold in several cases at \$14.50. Valley. Foundry iron is slightly firmer, owing to the withdrawal of several sellers at the \$14 price, but iron can still be had at \$14. Valley, for May and June delivery. For third quarter an advance is generally asked, but consumers are not disposed to pay any advance for forward

delivery when stocks are as large as they are. On the whole the pig-iron market has not justified the more optimistic tone which was observable a week ago.

Steel—Deliveries continue good on old contracts, but there is scarcely any new business going as consumers are well covered. In the local market billets are firm at \$23 and sheet-bars at \$25.50, as formerly.

Sheets—Demand is only fair. The mills are running at 65 or 70 per cent. of capacity. Prices remain on the basis of 2.25c. for black and 3.25c. for galvanized, 28 gage, ordinary carloads, while on very attractive orders these prices are sometimes shaded \$1 per ton.

Ferromanganese—The market continues rather weak, being quoted at \$41, Baltimore, or \$42.95, Pittsburg, for ordinary lots. On an attractive order this price could probably be shaded.

Foreign Trade in Iron and Steel

Iron and Steel Exports—Exports of iron and steel, including machinery, from the United States for the three months ended March 31 are valued by the Bureau of Statistics of the Department of Commerce and Labor at \$42,699,772 in 1908, and \$33,151,008 in 1909; a decrease of \$7,548,764, or 17.7 per cent. The leading items of export were, in long tons:

	1908.	1909.	Changes.
Pig Iron.....	6,766	8,754	1. 1,989
Billets, ingots & blooms	50,460	24,407	D. 26,053
Bars.....	15,929	14,947	D. 982
Rails.....	35,425	50,793	1. 15,368
Sheets and plates.....	24,229	33,659	9,430
Structural steel.....	39,592	24,628	D. 14,964
Wire.....	35,636	33,192	D. 2,444
Nails and spikes.....	12,147	12,472	1. 325
Pipe and fittings.....	27,367	31,565	1. 4,198

These increases and decreases were about evenly divided.

Iron and Steel Imports—Imports of iron and steel and of machinery into the United States three months ended March 31 were valued at \$5,470,091 in 1908, and \$5,807,463 in 1909; an increase of \$337,372, or 6.2 per cent. Leading items of imports were, in long tons:

	1908.	1909.	Changes.
Pig Iron.....	29,129	31,415	1. 2,286
Scrap.....	1,130	1,315	D. 187
Ingots, blooms, etc.....	2,261	3,339	1. 1,078
Bars.....	9,958	5,072	D. 4,886
Wire-rods.....	3,091	3,243	1. 152
Timber.....	15,644	11,791	D. 3,853
Sheets and plates.....	650	1,005	1. 355

The most notable change this year was the decrease in timbrates.

Iron Ore Movement—Imports and exports of iron ore in the United States, three months ended March 31, long tons:

	1908.	1909.	Changes.
Imports.....	190,469	275,658	1. 85,199
Exports.....	19,815	20,023	1. 208

Of the imports this year 193,232 tons were from Cuba; the balance from Newfoundland and Spain.

Imports of manganese ore, three months ended March 31 were 71,894 tons in 1908, and 37,118 tons in 1909; decrease, 34,776 tons.

Metal Markets

New York, May 12—Many improvements in the current markets are reported, and the general feeling seems to be improving; sales are increasing.

Gold, Silver and Platinum

UNITED STATES GOLD AND SILVER MOVEMENT

Metal.	Exports.	Imports.	Excess.
Gold:			
Mar. 1909.	\$21,252,462	\$5,181,648	Exp. \$16,090,814
" 1908.	1,447,206	3,649,407	Imp. 2,202,201
Year 1909.	37,978,632	12,158,275	Exp. 25,820,357
" 1908.	3,869,003	17,296,024	Imp. 13,427,021
Silver:			
Mar. 1909.	5,079,287	3,279,531	Exp. 1,799,756
" 1908.	4,320,360	9,737,027	Imp. 5,416,667
Year 1909.	14,473,930	10,453,218	Exp. 4,020,712
" 1908.	12,686,287	10,830,556	Imp. 1,755,631

Exports from the port of New York, week ended May 8: Gold, \$1,177,303, chiefly to Paris; silver, \$1,065,320, chiefly to London. Imports: Gold, \$32,226; silver, \$39,647, both from the West Indies and South America.

Gold—There has been less competition for the metal in the open market in London and prices are slightly lower, 77s. 9½d. per oz. being paid for gold. Paris is still taking a little and the Bank of Germany has also been in the market. Some small shipments of gold have been made from New York to Paris and more is expected to go.

Platinum—The market is quiet, sales being regular but not larger than for some time. The quotations made by dealers in New York are still unchanged, at \$23@24 per oz. for refined platinum, \$26 for hard metal and \$19@21 for scrap.

Our special correspondent reports from St. Petersburg under date of April 29, that the market is dull and inactive. The small dealers and miners still hold some platinum, which is keeping down prices. These small miners are offering crude platinum, 83 per cent. metal, in Ekaterinburg at 4.50 rubles per zolotnik—equal to \$16.92 per oz. In St. Petersburg quotations are nominal in the absence of business at 18,000@19,000 rubles per pound—average \$18.13 per oz. The conference on the platinum industries under the direction of the Imperial Council has begun its sessions.

Silver—Owing to resales on China account, silver has not maintained the high figure of 24s. 8d. reached in London May 5; but no great decline is looked for.

SILVER AND STERLING EXCHANGE

May.	6	7	8	10	11	12
New York....	53½	53½	53½	53	53½	52½
London....	24½	24½	24½	24½	24½	24½
Sterling Ex.	4 8760	4 8765	4 8755	4 8765	4 8770	4 8775

New York quotations, cents per ounce troy, fine silver; London, pence per ounce sterling silver, 0.925 fine.

Exports of silver from London to the East, reported by Messrs. Pixley & Abell, year to April 29

	1908.	1909.	Changes.
India.....	£ 2,536,438	£1,471,800	D. £1,064,638
China.....	511,400	1,038,200	I. 526,800
Straits.....	90,200	82,800	D. 7,400
Total.....	£ 3,138,038	£2,592,800	D. £ 545,238

Imports for the week, £2500 from Mexico and £180,000 from New York; total, £182,500. Exports, £67,500 to India and £55,000 to China; £122,500 in all.

Copper, Tin, Lead and Zinc

May.	Copper.				Tin.	Lead.		Zinc.
	Lake, Cts. per lb.	Electrolytic, Cts. per lb.	London, £ per ton.			New York, Cts. per lb.	St. Louis, Cts. per lb.	
6	13½	12½	58½	29½	4.20	4.12½	4.87½	
	13½	12½			4.25	4.17½	4.87½	
7	13½	12½	59½	29½	4.25	4.15	4.87½	
	13½	12½			4.27½	4.20	4.92½	
8	13½	12½		29½	4.27½	4.20	4.92½	
	13½	12½			4.25	4.17½	4.87½	
10	13½	12½	59½	29½	4.30	4.20	4.92½	
	13½	12½			4.25	4.17½	4.87½	
11	13½	12½	59½	29½	4.30	4.22½	4.92½	
	13½	12½			4.17½	4.17½	4.87½	
12	13½	12½	59½	29½	4.30	4.22½	4.92½	

London quotations are per long ton (2240 lb.) standard copper. The New York quotations for electrolytic copper are for cakes, ingots and wirebars, and represent the bulk of the transactions made with consumers, basis, New York, cash. The price of cathodes is usually 4.125c. below that of electrolytic. The quotations for lead represent wholesale transactions in the open market. The quotations on spelter are for ordinary Western brands; special brands command a premium.

Copper—The improvement reported in our last issue made further progress during the week May 6-12. Large orders were placed by domestic and foreign buyers from day to day, the aggregate of the sales running to many millions of pounds. Under this influence prices gradually advanced and close firm at 13½@13¾c. for Lake copper and 12½@13c. for electrolytic in ingots, cakes and wirebars. The average of the week for casting copper was 12½@12¾c., the closing price being 12¾@12½ cents.

Copper sheets are 16½c. base for large lots. Full extras are charged, and higher prices—up to 18c.—for smaller quantities. Copper wire has been advanced ¼c. to 14½c. base, carload lots at mill. Business has been quite active.

The figures of the Copper Producers' Association for April will be found on an editorial page.

A great deal of speculation concentrated upon the London standard market, and prices advanced from day to day, three months' option several times crossing £60. At the close the tone is somewhat easier at £50 1s. 3d. for spot, £50 15s. for three months.

Refined and manufactured sorts we quote: English tough, £63 10s.; best selected, £62 10s.@£63 10s.; strong sheets, £74 10s.@£76 10s.

Copper exports from the United States for the three months ended March 31 are reported by the Bureau of Statistics at 50,682 tons. For April exports are es-

timated at 21,235 tons, making 81,217 long tons for the four months.

Tin—In sympathy with copper, tin has advanced in the London market, and while not fully maintaining its gain, closes steady at £132 15s. for spot, £133 15s. for three months.

A fair business was transacted in the domestic market, where consumers have of late shown somewhat more interest. Consumption of the metal seems to be very satisfactory. At the close tin can be bought at about 29½ cents.

Visible stocks of tin on May 1—including 6942 tons afloat—were: Great Britain, 12,122; Holland, 1387; United States, excluding Pacific ports, 5316; total, 18,825 long tons, a decrease of 383 tons during April.

Exports of tin from the Straits in April were 4904 long tons. For the four months ended April 30, the exports were 18,580 tons in 1908, and 18,050 in 1909; decrease, 530 tons.

Spelter—There has been no change either in the volume of business or in the level of prices, and the market closes the same as last week at 4.87½@4.92½ St. Louis, 5.02½@5.07½c. New York.

The John Wahl Commission Company reports to us from St. Louis, under date of May 12, that spelter is strong, but very quiet. Sales are at 4.92½c. for prompt metal, 4.95c. for June.

New York quotations for spelter May 6-12, inclusive, were 5.02½@5.07½ cents.

Base price of sheet zinc is now 6½c. per lb., f.o.b. La Salle-Peru, Ill., less 8 per cent. discount.

The market in London is unchanged at £21 17s. 6d. for good ordinaries, £22 2s. 6d. for specials.

Lead—Consumption has been broadening from day to day and heavy orders have been placed from all sources. Under their influence, together with that of the strikes in Missouri and Utah, prices advanced steadily. The American Smelting and Refining Company raised its price to 4.25c. on May 7, and to 4.30c. on May 12. The market closes firm at 4.17½@4.22½c. St. Louis, and 4.30c. New York.

The John Wahl Commission Company reports to us from St. Louis, under date of May 12, that lead is strong and higher. Latest sales are on a basis of 4.25c. for Missouri brands, and even at that price there are more buyers than sellers. Forward metal cannot be bought below 4.30c. today.

The London market shows only narrow fluctuations and closes steady at £13 5s. for Spanish lead, £13 7s. 6d. for English.

The International Lead Company has been organized at Bayonne, N. J., to manufacture white lead under patents owned by John W. Bailey. The company, which was incorporated at Trenton May 11, with a capital of \$1,500,000 will operate a factory at Bayonne for the manufacture of

white lead and kindred products. The incorporators are John W. Bailey, the patentee; John Josten and Harry G. Robinson, of the Newhouse staff. It is stated that the enterprise has no connection with the Newhouse mining properties, and will buy its raw material on the open market.

Other Metals

Antimony—Quotations are $8\frac{3}{4} @ 8\frac{1}{2}\%$ for Cookson's; $7\frac{3}{4} @ 8\%$ for U. S.; $7\frac{1}{4} @ 7\frac{1}{2}\%$ for outside brands. Prices are still supported by the expected duty on the metal. Business is lighter than at last report.

Aluminum—Business is quiet and prices unchanged. No. 1 ingots, $22 @ 24\%$ per lb. base for large lots; wire, $31 @ 32\%$, and sheets, $33 @ 34\%$ base.

Quicksilver—Sales are about as usual, and price unchanged. New York, \$44.50 per flask of 75 lb.; San Francisco, \$44 for domestic and \$42 for export trade. London, £8 7s. 6d. per flask, with £8 3s. 9d. quoted from second hands.

Nickel—Large lots, contract business, $40 @ 45\%$ per lb. Retail, spot, from 50c. for 2000-lb. lots up to 55c. for 500-lb. lots. The price for electrolytic is 5c. higher.

Cadmium—Current quotation 75c. per lb., in 100-lb. lots, at Cleveland, Ohio.

Magnesium—Quotations for this metal are \$1.25 per lb., New York, in 100-lb. lots; for 5-lb. lots, \$1.40 per pound.

Zinc and Lead Ore Markets

Platteville, Wis., May 8—The highest price paid this week for zinc ore was \$32 per ton; the base price was \$40 per ton of 60-per cent. zinc. For 80-per cent. lead ore, \$53 per ton was paid.

SHIPMENTS, WEEK ENDED MAY 8.

In addition to the above there was shipped to the American Zinc Ore Separating Company, 668,750 lb., and to the Joplin Separator Works, 60,000 lb. zinc concentrates.

Joplin, May 8—The highest price reported paid for zinc ore was \$43 per ton. The high base declined to \$40, ranging down to \$37, a decline on all grades of \$1 per ton for sulphide ores. Silicate ores remained on a base of \$17 @ 19 per ton of 40-per cent. zinc, with the high price at \$22. Average all grades, \$36.96. A little lead sold as high as \$57, but the high price generally was \$55.50. The average

for all grades was \$55.26 per ton. A decreased shipment of sulphide ores, with the usual shipment of silicate ore run the average price, all grades, down \$1.70 per ton lower than last week.

The shipment is a decrease of 1024 tons of zinc and 34 tons of lead, compared with the previous week. With the shipment lowered to 5131 tons and an output of approximately 5700 tons, there is added to the reserve stock a little over 500 tons. Week-end buying was even lighter than early in the week, with a weaker tendency apparent.

SHIPMENTS, WEEK ENDED MAY 8.

NOTE—Under zinc ore the first two columns give base prices for 60 per cent. zinc ore; the second two the average for all ores sold. Lead ore prices are the average for all ores sold.

Petroleum

Another cut of 5c. per bbl. in all grades of crude oil was announced in Pittsburg, May 11, by the Standard Oil Company. This makes the second reduction in the price within a week, prior to which time there had been no change in the price in more than two years. Pennsylvania oil is now quoted at \$1.68. Large stocks in storage in Oklahoma and a decline in demand caused the cut.

Chemicals

New York, March 12—The market is about the same as last week. Current business is fair, and deliveries on contracts about the same.

Copper Sulphate—Sales continue only fair. The cutting in prices, which was done recently, has been recognized by a decline. Current quotations are \$4.22½ per 100 lb. for carload lots and \$4.47½ per 100 lb. for smaller orders.

Arsenic—Current quotations are 2½ @ 3c. per lb. for white arsenic.

Nitrate of Soda—The market has been quite active, and a fair business was done at ruling prices, which are 2.15c. for spot and 2.12½c. for futures.

Phosphates—Exports of Florida phosphates through the port of Savannah in March are reported by J. M. Lang & Co. at 550 tons, to Germany.

Mining Stocks

New York, May 12—The general stock market during the past week has been active and strong. Speculation for the rise followed closely after the commodities clause decision rendered by the Supreme Court, and interpreted favorably by the large financial interests. The plain evidences of improving business have increased the courage of those favoring a rise in stock values. The improved outlook for copper metal has also been an important factor in aiding the rise in copper stocks. It is, of course, not necessary or certain that a bull movement in the stock market should always terminate in excited trading and million-share days; however, important rises in stock values do often culminate in this way. Careful observers of market conditions are at present cautious in commitments, believing that the present average range of prices is at a point where bad news will have a decided effect. The technical market situation is still strong, notwithstanding the gradual advance for many days past.

The Curb followed the general market, being especially inclined to boom copper stocks.

One sale of Homestake, of South Dakota, was reported during the week, \$93 per share being paid for 200 shares.

Boston, May 11—A much better feeling is manifest in the mining-share market and there is hope of its continuance. If it were not for the gyrations of North Butte, prices might be higher. As it is they show substantial advances from a week ago. An improvement is noted in the metal market. Money continues easy and brokers report that they are carrying a comparatively small amount of stocks for customers. Speculative temper is now optimistic and the public, with proper coaching, can be induced to come into the market. Manipulative tactics are now occurring in some specialties with a view of marking prices up.

North Butte has had an extreme fluctuation of almost \$6 during the week, breaking from \$68.50 to \$62.75 with subsequent recovery to \$64.75 and the close tonight \$62.75. Apparently the same tactics as occurred in Boston & Montana and Butte & Boston, just previous to their being taken into the Amalgamated camp some years ago, are being pursued at the present time. Boston Consolidated enjoyed a spurt from \$12.50 to \$17.25 last week although it has since reacted to \$15.12½. There has been a good demand for Lake and North Lake.

Lake Copper will probably issue 10,000 shares of treasury stock at \$25 per share soon to provide working capital.

Shannon Copper sold up \$1.50 to \$16.75. This company is to issue \$600,000 in 6-per cent. convertible bonds for the construction of a railroad to connect the mines with its smelter. They will be convertible into stock at \$20 per share within three years. This will require an additional 30,000 shares of stock. The right to subscribe is a \$1000 bond for every 500 shares of stock. There is an underwriting commission of 5 per cent. The Copper Range report shows \$3.29 earned on the stock, against \$4 paid for 1908. Amalgamated had a \$6 rise to \$84.50 and closed but \$1 less.

Giroux Consolidated has been taken from the Curb to the unlisted department of the Stock Exchange. All the better class of stocks on the Curb are higher with an increasing volume of business.

The Engineering and Mining Journal

VOL. LXXXVII.

NEW YORK, MAY 22, 1909.

NO. 21.

The Diamond Bearing Highlands of Bahia—II

Miscellaneous Mineral Resources of the Diamond Country Are Extensive but Have Received Only Slight Development. Mining Laws Favorable

B Y J. C. B R A N N E R *

There is much manganese in the Minas series of the Chapada Diamantina. It was found to follow the strike of the rocks along the east face of the Serra de Jacobina, always in about the same stratigraphic position. The presence of the mineral is shown by the lumps of ore (psilomelane) scattered over the surface of the ground. At one place, just west of the city of Villa Nova and on the base of the eastern slope of the Jacobina range, the deposits have been prospected somewhat but no attempt has been made to mine or ship the ore. Near the same horizon this manganese is exposed again near the east base of the Serra de Sant'Anna on Fazenda Amarante.

One might suppose that the long railway haul from the interior to tide water at Bahia, and the change of gage at Alagoinhas would be an insurmountable obstacle to the mining of manganese in this part of the state. It should be remembered, however, that the haul by rail from the interior of Minas Geraes to Rio de Janeiro is still longer and yet the Minas mines are among the best paying manganese deposits in the world. The railway haul from the Morro de Mina deposits in Minas is 468 km., and the haul from the mines at Miguel Burnier is 498 km. Villa Nova, near which the Bahia deposits occur, is 444 km. from the port of Bahia, and the railway haul could be

Carnahyba, about 40 km. west of Angico, a station on the São Francisco railway. This property was examined by an English company and an unsuccessful effort is said to have been made to purchase it. The writer did not personally visit the place, but sent an assistant, Roderic Crandall, through the region for the purpose of getting an idea of the general geology. Mr. Crandall made no detailed examination of the property but reported that the copper ore impregnated a basic eruptive that was deeply decomposed.

The rocks in which the ore occurs is an eruptive that varies from a pyroxenite to a norite or hypersthene gabbro, and belongs to the pre-Cambrian crystalline

THE VALLEY AT MOSQUITOS

Seven kilometers south of Lencoes; the serra of the diamond-bearing rocks in the background; the valley in the foreground is deeply filled with the waste from old diamond washings.

Farther north the ore is found along the east base of the same range two or three kilometers west of the village of Jaguarray. It occurs again on the east slope of the range a few kilometers west of the station Itumirim. In the vicinity of the city of Jacobina the manganese appears on the east side of the range in about the same stratigraphic position. It was found in the usual form of loose lumps of ore in the red soil, about one kilometer east of the Engenho de João Dias on the *sítio* Cruz das Almas. The same kind of ore is reported from several other points along the east face of the Jacobina range.

*Professor of geology, Stanford University, California.

JUNCTION OF THE ANDARAHY AND PARAGUASSU RIVERS

Low grounds, three kilometers southeast of Andarahy. Taken at time of high water. The diamond-bearing serra in the background.

shortened considerably by building a piece of railway from Entrocamento on the São Francisco line to reach the tide water at Santo Amaro or Cachoeira.

No reference is here made to the manganese deposits in the region near Nazareth in the State of Bahia. Those deposits are near the coast, are well known, and the mines have already been in operation several years. I have briefly described them in a paper¹ entitled, "The Manganese Deposits of Bahia and Minas, Brazil."

COPPER

Copper is found on an estate called

series mentioned above. No attempt was made to obtain an average sample of the ore but a specimen, taken pretty much at random and probably rather above the average, was assayed and found to contain 3.83 per cent. of metallic copper. In all the specimens seen the ore is in the form of malachite and chrysocolla which form a multitude of small veins through the altered rock.

The copper-bearing eruptives are found at several other places within the area of crystalline rocks east and northeast of Angico as far as Patamutê. Some specimens of copper ore given me in 1907 and said to have come from the Serra de Muribeca, 80 km. south of Capim Grosso, have the copper in the form of malachite

¹Transactions of the American Institute of Mining Engineers, Vol. XXIX, pp. 756-770, New York, September, 1899.

and cuprite. An assay of this ore shows it to contain 39.1 per cent. of metallic copper. The specimen is apparently a picked one.

If these copper deposits are found to be of sufficient magnitude and richness to be workable, a branch railway can readily be constructed from Angico to the mines, owing to the flatness of the country. The scarcity of fuel and water would make it difficult to reduce the ore on the ground. Occasional specimens of copper have been reported from several other portions of the state of Bahia, but so far as the writer has been able to learn the region above referred to is the only one that holds out much promise of becoming productive.

The facts here given can only be regarded as suggestions which may be worth following up. A sentence from a recent publication² on the minerals of the state of Bahia expresses the popular idea of the importance of the Carnahyba deposits: "The Carnahyba mine alone could furnish copper enough to supply the whole world for 100 years!"

work certain hydraulic properties at Caldeirão, where placer gold has been mined, but after spending much money the company is reported to have abandoned its projects. Considerable gold was formerly taken out in the vicinity of Rio de Contas, but the industry is said to have been abandoned many years ago. That particular region was not visited by the writer, and nothing authoritative can be said of it here.

SALT PRODUCTION IN THE INTERIOR

In every list one can find of the mineral products of Bahia rock salt is always mentioned. Whether rock salt really exists in Bahia cannot be stated positively, but the writer has never been able to find it, though diligent search has been made and many clews have been followed up. Search has also been made for salt-water springs but thus far without success. It now seems probable that the expression "rock salt" has been used without a clear idea of its meaning. Large quantities of salt are annually manufactured in the in-

terior of Bahia, but in every case that has come to the writer's knowledge, this salt is made by leaching the upper layers of the dry earth where lakes, ponds and pools have evaporated.

It will be noted that a large part of this region is covered with limestones. Throughout this limestone area most of the country is flat and the streams, when they exist, are sluggish. The result is that in seasons of rain the water gathers in shallow ponds that soon dry up. This process of concentration carried on for long periods has left the salt and other easily soluble minerals from these waters in the soft, limy earth in the bottoms of the ponds. After the water evaporates the people gather up the thin upper layer of this earth, leach out the salt and boil the water down in iron kettles or allow it to evaporate in wooden troughs. In this way almost all of the salt supply of the interior is obtained. Of late years the prolongation of the railways has made it possible to ship better grades of salt into the interior, but those who live far from the railway lines still manufacture their own salt or buy it near at hand. In 1907 the railway freight on a sack of salt from Bahia to Joazeiro, a distance of 574 km., was from 66 to 82c. American money.

Although much has been written about salt in the interior, hitherto no one seems to have taken the trouble to have the salt examined chemically. It is common experience of persons traveling in the interior to be troubled with temporary and sometimes serious intestinal derangements that are attributed to the salt. Analyses do not seem to bear out this theory. Specimens of the salt made in the interior were brought away and analyzed, the

CHARACTERISTIC VIEW ACROSS SALITRE VALLEY

It is covered with catunga forests. An abundance of excellent water can be had from wells in this region.

SURFACE LIME ROCK ALONG THE RAILWAY NORTH OF ANGICO

GOLD

Gold was formerly mined at many places in the Chapada Diamantina of Bahia. A few years ago it was mined along the mountain streams in the vicinity of Jacobina. The stream gravels are so far exhausted, however, that it cannot be said that there is any systematic gold mining now carried on in these gravels. In the vicinity of Jacobina are some properties said to contain gold associated with various forms of pyrites, but at the time of the writer's visit to that part of the state none of these properties were being operated. Some gold is commonly found in washing for diamonds and carbonados, but there is not enough of it to constitute a gold-mining industry.

Gold is known to exist in the southern part of the Serra do Assurná, and there has been some gold mining done in the vicinity of the village of Gentio. The gold is chiefly from stream gravels, but gold-bearing quartz is said to occur in the shales throughout. A few years ago a gold-mining company was organized to

work certain hydraulic properties at Caldeirão, where placer gold has been mined, but after spending much money the company is reported to have abandoned its projects. Considerable gold was formerly taken out in the vicinity of Rio de Contas, but the industry is said to have been abandoned many years ago. That particular region was not visited by the writer, and nothing authoritative can be said of it here.

It will be noted that a large part of this region is covered with limestones.

ANALYSES OF SALT FROM SALITRE VALLEY, BAHIA.

L. R. LENOX, Analyst.

	Tabua.	Vargem do sal.
	Per Cent.	Per Cent.
Moisture and organic matter.....	0.50	1.60
Insoluble matter, mostly sand.....	1.32	0.63
Magnesium sulphate (MgSO ₄).....	0.36	0.86
Calcium sulphate (CaSO ₄).....	2.68	1.75
Calcium chloride (CaCl ₂).....	0.63	0.63
Sodium chloride (NaCl).....	95.20	94.68
Total.....	100.06	100.18

Throughout this limestone area most of the country is flat and the streams, when they exist, are sluggish. The result is that in seasons of rain the water gathers in shallow ponds that soon dry up. This process of concentration carried on for long periods has left the salt and other easily soluble minerals from these waters in the soft, limy earth in the bottoms of

results being shown in the accompanying table.

The sand in this salt could readily be eliminated; otherwise the analyses show the Salitre valley salt to be quite as good as the sea salt from Turks island or Lisbon.

SALTPETER

One hears many reports of the existence of large quantities of saltpeter in this region. The Salitre (saltpeter) valley covers an area of 12,500 sq.km., and it is supposed that Rio Salitre took its name from the abundance of saltpeter within its drainage basin. There are large areas of limestone in that valley, and caves are common in the limestones, and these caves contain more or less saltpeter. However, I have never found any large quantities of saltpeter in the many caves I visited though the earth in the caves is generally more or less impregnated with it. In the regions of the Caboco shales there are also a good many caverns which contain saltpeter. Such caves are common in the mountains lying about the eastern end of the Calmon valley, and about the Almas valley.

²Antonio J. de Souza Carneiro, *Riquezas Minerais do Estado da Bahia*, p. 47. Bahia, 1908.

The saltpeter seems to have been formed in many instances by the reactions produced by the potash minerals and the droppings of small rodents, called *mucoto*, that live in the caves. In some cases it seems to have been washed in from the surface.

It is quite probable that an important saltpeter industry might be established by leaching the earth from the dry caves of the interior. The dryness of the atmosphere of the region would do away with the necessity and expense of artificial evaporation. Though the local demand is too small to warrant such an industry, foreign markets would readily be found for the output.

MINERAL PIGMENTS

In the Caboclo shales there are at many places ochers that will probably be valuable when transportation facilities will have improved. Such ochers appear to be abundant in the region about the Almas valley and east of the Calmon valley. On the road leading from Morro do Chapeo to Lençoes on an estate known as Roça Grande the yellow ocher beds are also well exposed at many places. A sample gathered about 2 km. south of the house at Roça Grande was analyzed by L. R. Lenox with the following results: Hygroscopic water, 0.73 per cent.; loss on ignition (water and organic matter), 7.14; sodium chloride (NaCl), 2.15; potassium oxide (K_2O), 1.32; sodium oxide (Na_2O), 0.13; oxide of iron (Fe_2O_3), 10.47; alumina (Al_2O_3), 20.71; silica (SiO_2), 56.54; lime (CaO), none; magnesia (MgO), 0.64; total, 99.83.

In the vicinity of Lençoes the diamond washers find some deep red rock fragments associated with the diamond-bearing gravels. These fragments, called *caco de telha* or tile fragments, are regarded as good "signs" of diamonds. They are simply lumps of impure iron ore that form beds of great thickness and wide distribution in certain parts of the diamond district. Their brilliant red color suggests the possibility of their being used for the manufacture of red paint. The following analysis shows the composition of some of the larger lumps: Hygroscopic moisture, 0.65 per cent.; loss on ignition (water and organic), 9.80; silica (SiO_2), 24.54; oxide of iron (Fe_2O_3), 50.84 (equivalent metallic iron, 35.57); alumina (Al_2O_3), 14.03; lime (CaO), none; magnesia (MgO), 0.21; total, 100.07.

MARBLE

Much of the rock shown on the accompanying map as limestone is marble. The beds are often so folded and the rocks so thinly bedded that they have no value as a marble. In other cases, however, the beds are thick enough to form good building stones, and the beds are horizontal or in position to be readily quarried. The colors vary from a straw color to a vermilion red and to a bluish black. There

are also brecciated marbles of great beauty, while the travertine or "onyx" marbles are abundant and remarkably fine. At present no use is made of the marbles of this region.

At one place white saccharoidal marble was found among the rocks of the old crystalline series. This locality is on the line of the São Francisco railway at and about km. 435, or 4 km. north of the Carnahyba station.

LIMESTONE OTHER THAN MARBLE

There is a large demand for lime in Brazil and with the exception of accumulations of shells and the coral reefs along certain parts of the coast, there is but little limestone in that country within reach of water transportation. The railway from Bahia to Joazeiro on the Rio São Francisco crosses a zone north of Angico in which limestone covers the surface of the ground over an enormous area.

also extensively burned for lime for which much of it is well adapted.

Although this limerock is of considerable local importance, owing to its convenience to railway transportation, there is not enough of it to meet any large demand or to maintain a constant output.

The great limestone areas of the state are in the valleys of the Salitre, Jacaré, and Rio Verde, and in a north-south belt lying along Riacho Utinga and Rio Una. The total area covered by limestones (and marbles) in these basins, and not including the great limestone regions lying north and west of the Rio São Francisco, amounts to about 25,000 sq. km. This estimate does not include the areas of recent land and fresh-water deposits such as those along the railway between Angico and Carnahyba.

The day will come, sooner or later, when some of these limestones will be used for the manufacture of portland

SALT FACTORY AT TABUA ON THE UPPER RIO SALITRE

The earth is scraped up in the foreground; the leaching troughs are under the trees near the heaps of the leached earth.

It was formerly supposed that this limestone was paleozoic and that the quantity of it was, for all practical purposes, unlimited. Years ago Mr. Derby expressed the opinion that the limestones in this particular belt were of fresh-water origin. And a careful examination of the entire section from Angico to Joazeiro shows that Mr. Derby's conclusion is practically correct. With the single exception of certain marbles mentioned above, the beds are all superficial and are spread over a wide flat plain to a depth which was nowhere found to exceed to meters.

On the line of the railway the limestone extends from km. 391 just north of Angico to km. 433, a short distance north of Carnahyba station. At several places, however, the drainage has removed it, and the underlying crystalline rocks are exposed. At and about Carnahyba the rock has been quarried for building purposes, and some of the stations of the railway are made of this limestone. It is

cement. At present no portland cement is manufactured in Brazil. The cement used in that country is imported from Europe.

Close to the limestones there is an abundance of clays and clay shales, especially in the Caboclo beds, that would answer perfectly for the manufacture of portland cement.

MICA AND OTHER MINERALS

In the area of the old crystalline rocks many occurrences of mica of commercial importance are known. None of them, however, is worked at the present time. On the road between Jacobina and Villa Nova, I found a pegmatite dike containing beautiful crystals of mica, many of them measuring 10 cm. and some of them 15 cm. in diameter. Other similar dikes with equally large crystals are reported from many places in the valley of Rio Itapicuru. I have seen some fine mica plates said to have come from the vicinity of the falls

of Paulo Affonso. Many other localities are said to contain mica of commercial sizes. Mica mining would certainly be undertaken in this region if someone acquainted with the methods of mining, separating and marketing it would start the work and give the people a little practical experience of how it should be done.

Many other minerals occur in this region, but though they will doubtless be of great importance at some time in the future, they are of but little actual value under existing economic conditions. Among such minerals may be mentioned iron ore, iron pyrites, abrasives, refractory materials, building stones, slates, clays, glass sands, etc.

THE WATER SUPPLY

In a region affected by droughts that sometimes draw themselves out for several years, the water supply is a matter of prime importance. Although the map shows many rivers traversing the diamond district of Bahia, as a matter of fact during the greater part of the year most of the streams shown on the map are stream channels rather than streams. The rural population lives chiefly by cattle raising and by farming on a small scale. In times of droughts nearly all of the smaller streams dry up, and to get water for domestic use and to water the cattle, rude, open pits are dug in favorable spots in the stream beds. When the droughts are prolonged beyond a certain period water for domestic use has to be brought for many leagues, and the cattle must be driven away or left to perish of thirst.

A study of the structural geology shows that water is really abundant throughout almost all the diamond district and can be had by means of ordinary open wells, by driven wells and even by bored artesian wells. The gently folded geological structure and the character of the rocks lend themselves readily to the use of artesian wells over a large part of the area. In the Salitre valley there is a series of gravels and sands usually lapping back against the bases of the mountains, especially along the western side of the valley. Water flowing from the mountain ranges sinks into this formation as soon as it reaches its margins and passes out toward the axis of the valley. It is very evident that these gravels contain an abundance of excellent water that can be reached almost anywhere in the gravel area.

Unfortunately the people living in this region know nothing about wells of any kind, and being very conservative, they are not disposed to try new methods of obtaining water, until someone proves by actual experiments that the water can certainly and cheaply be found. The writer has seen water for domestic use carried a distance of 26 km., when a well driven on the spot 4 m. deep would have obtained all the water required, and of excellent quality. Other cases are reported where the water had to be carried

as much as 40 km. The manufacturers of some cheap forms of driven wells and pumps could build up a good business in the interior of Bahia by putting down two or three such wells, and showing the people how to use and care for them.

SOILS

The soils of this region are naturally divided into the alluvial soils of the large rivers, the soils of the limestone areas and the soils of the area of crystalline rocks. The other formations have yielded each its own residuary soil, but these areas are of minor importance.

The alluvial soils of the Rio São Francisco are as fertile as such soils ever are and their proximity to an unfailing water supply in that great river makes them especially desirable for certain kinds of agriculture.

The limestone soils are as fertile as can be found in any part of the world, and over enormous areas they stretch as far as one can see like great prairies with just enough slope to drain them well. Unfortunately there is very little of this excellent soil now under cultivation. Along some of the streams like the Rio Salitre, Rio Jacaré and Rio Verde, the narrow flood plains of those streams are planted in sugar cane, in corn, or cotton, but over most of these plains the aboriginal *catinga* forests still grow undisturbed.

In the area of the crystalline rocks the soils are not so good as those of the alluvial plains or of the limestone regions. Still they support a considerable population. Cotton is grown in small patches, sugar cane flourishes along the streams and much coffee is grown in the mountainous districts. Unfortunately modern agricultural machinery is unknown. Not a single plow was seen in the thousands of miles traveled by our party. Almost all agricultural work is done by hand with large, heavy hoes.

MINING LAWS OF BAHIA

Persons wishing information concerning the details of the mining laws of Bahia should consult law 624 of Sept. 9, 1905, of that State, and the general mining regulations relating thereto. These regulations were translated and published in English by *The Brazilian Review* at Rio de Janeiro in 1907. Space will not allow any extended quotations from or discussions of the mining laws and regulations. The following points may be of interest:

Unless otherwise stipulated in the original grant the State owns the minerals on private lands, in the beds of navigable streams, all lands classified by law as diamond lands and all abandoned claims. Persons wishing to do prospecting on State lands must obtain formal permission of the government; such permission may not be for more than 24 months, and the area to which prospecting is confined must not exceed 1000 sq. km.

The discoverer of mineral deposits is

required to have surveys made and registered and a fee is charged. When the applicant owns the land, the fee is 50 milreis (about \$16); when he is not the owner of the land, the fee varies from 200 to 2000 milreis (from \$66 to \$660.) When a mine is on private land and cannot be purchased, the State may expropriate it. Concessions and leases can be transferred only with the previously obtained consent of the government.

Most minerals taken from mines are taxed on their gross values at rates varying from nil to as high as 50 per cent. on monazite sands. The tax on diamonds and gold is from two to ten per cent. on the gross values at the mines. Until Sept. 1915, iron and manganese mines are exempt from these taxes. The government may make differential rates for the purpose of encouraging an industry.

Foreigners are subject to the Brazilian laws and courts in matters relating to mining operations the same as if they were Brazilians. In case of lawsuits against mining establishments embargoes may be placed upon the product of the mine, but not upon the establishment itself. Mining operations are encouraged by expropriations of land, water and timber required for the operation of mines and by preferences in the concessions of water rights.

GENERAL OBSERVATIONS

The writer finds so much misinformation regarding Brazil in general that he uses this opportunity to correct some of it. Persons who expect to do business in Brazil should endeavor to see things in a large way, and they should make up their minds to conform to a reasonable extent to the customs of the country. Those who are not willing to make such small concessions should not go there.

For those who have business in the interior it is worth remembering that wagons are but little used, and consequently there are but few wagon roads. Freight that has to go into the interior beyond the railway lines must generally be carried on mule back. For this reason everything should be so packed that it can be readily loaded on animals and can withstand the bumps and kicks to which such packages are usually subjected.

The climate of the mining regions is for the most part remarkably fine. Reference is here made to the interior of Bahia and to Minas Geraes and Goyaz. Being in the tropics, it is to be expected that the climate is a hot one, but these regions are elevated and during most of the year are dry and healthful. Along some of the rivers there is malaria especially during certain seasons.

Nearly all kinds of supplies required by prospectors and miners can be had in Rio de Janeiro. Many such supplies can also be had in Bahia and other large cities but one cannot always count on finding special forms of machinery, transit instruments and the latest devices of every kind. When

large quantities of any one thing are required it is hardly safe to depend on the local markets, except for food, clothing, lumber and such things as the country itself produces or are in constant demand by the people.

Labor is cheap and when promptly paid and properly treated it is very good. In the manganese mines of Minas Geraes unskilled labor is paid at the rate of about a dollar a day for a 10-hour day. In the vicinity of Bahia laborers get about 75c. per day. Owing to the uniformly high prices in the diamond district, labor there is somewhat higher.

The language of the country is not Spanish; it is Portuguese. And bad Spanish is not good Portuguese. Neither will some other language do just as well. In the largest coast cities one finds many foreigners who speak English, French, German, Italian and almost any other language, but those who have business to transact with the government, or with the people, or who have to live in or travel through the country must speak the language with some sort of fluency or they must pay the price for their inability to speak it.

Gaseous Currents in Meyer's Tangential Chambers

By V. P. DAVIS*

In *Zeitschrift für angewandte Chemie*, Nov. 6, 1908, Dr. K. I. Beskow, of Helsingborg, describes a series of experiments, which were made with a view to proving that the gaseous currents in Meyer's chamber system really follow a tangential course, flowing in a circular path along the chamber walls.

The experiments consisted in placing a piece of glass tubing about $2\frac{1}{2}$ in. in diameter and 1 ft. long horizontally at various points and in different positions within the chambers and determining the quantity of acid condensed in each instance in equal periods of time. The tube was bent up on the lower edge at each end to form a "boat" or receptacle for the acid, and in order to increase the condensing surface, a spiral of glass was fixed within the tube.

The different positions of the tube were as follows: In the entrance pipe, parallel and perpendicular to the gas current; in the chamber about 24 in. above the bottom lead, 20 in. from the side lead and 85 ft. from the entrance pipe, parallel and perpendicular to the side lead; half way between chamber top and bottom, 20 in. from the side lead, and about 47 ft. from the entrance pipe, parallel and perpendicular to side lead.

The distance from the entrance pipe is taken along the periphery of the chamber. The chambers are cylindrical, 9.8 m. (32

ft.) high and 9.6 m. (30 ft.) in diameter. In the entrance pipe the tube condensed 8.8 gram H_2SO_4 when parallel, and 3.7 grams when perpendicular to the gas current, or in about the ratio of $2\frac{1}{2}$ to 1. Within the chambers the ratio of condensation in the tube (parallel-perpendicular) varied from $2\frac{1}{2}$ to $3\frac{1}{2}$: 1.

Beskow aptly terms the position of the tube when perpendicular to the side lead as the "radial" position. He shows several interesting diagrams plotted from the table of results and draws the conclusion that there is unquestionably a strong tangential motion of the gases within the chambers.

It has been stated that the good work of the Meyer system is due rather to greater height than to any actual tangential current of the gases, but the foregoing experiments would indicate that Dr. Meyer's claims rest on a most substantial basis.

A Mexican Malacate in England

By H. MAPLETHORPE*

The accompanying illustration is from a photograph of a horse-power winding drum that has been in use for many years at the Forge colliery, Forge Lane, Wednesbury, Staffordshire. The drum, or malacate, as it is called in Mexico, has been superseded by a modern steam hoist-

The Tasmania Gold Mining Company

The report for the twelve months ending Sept. 30, 1908, has been issued. The results of the year have not been profitable, as, notwithstanding gold production of a value of £128,646, the accounts show a small adverse balance. The number of tons milled was 70,272, giving a yield of 36.6s. per ton. The reduction works consists of a stamp mill with a chlorination and cyanide plant. Additional cyanide plant is being considered to take the place of the chlorination process, which is expensive to run.

The development of the mine at the bottom, or 1250-ft. level, has been disappointing, but it is hoped that it is merely a poor zone that is being passed through, and that the lode will improve at greater depth. The ore reserves are only 59,125 tons, and it is evident that development work wants pushing.

The mine is heavily watered, but the pumps have been equal to the work given them. The heaviest flow of water on one day was 4,894,760 gal., or 3400 gal. a minute. This amount of water makes pumping charges a serious item, the total for the year being £19,186, which is about 18 per cent. of the operating expenditure at the mine.

MALACATE IN USE AT FORGE COLLIERY, STAFFORDSHIRE

ing plant, but is still kept in reserve, ready for use. It is useful from time to time for sinking.

The Rising Sun Oil Company is preparing to build a large refinery at Hakata, Japan. It is probable that oil from Borneo will be used principally.

*2 Salisbury street, Walsall road, Darlaston, Staffordshire, England.

According to statistics collected for THE MINERAL INDUSTRY, the production of alundum in the United States in 1908 was 3,160,000 lb., valued at \$189,600, against 6,751,444 lb., valued at \$405,086 in 1907. This abrasive substance is made only at Niagara Falls, and by the Norton Emery Wheel Company, of Worcester, Mass. It is used in the manufacture of artificial corundum for grinding wheels.

Gold and Other Minerals of Eastern Siberia

The Province of Baikal Has Rich Gold Quartz Veins; Amurski Oblast Possesses Placer Deposits from Which Gold Is Won by Primitive Methods

B Y S . F . G . W H I T E *

In this article I shall deal only with those portions of eastern Siberia that I have visited. On one trip I had occasion to investigate reef mining in this little known country.

PROVINCE OF BAIKAL

The following described quartz mines (in the true sense of the word) are the only ones in the province of Baikal that have been systematically worked by Russian companies:

1. A stockwerk formation of a granitic nature with a pay streak 35 ft. in width, situated on the slope of a hill and dipping at an angle of 30 deg. The ore varied from 4 dwt. to 4 oz. gold per ton. Adits were driven on several levels, the total length being over 1500 ft. One shaft was sunk at the base of the hill to a depth of 110 ft. to water level when operations were abandoned. Following the first operation, a French engineer attempted to work the mine as a quarry, the latter method destroying all timbers and completely closing up all approach. A mill of 24 stamps of 640 lb. each was built on the creek side. Most of the tailings were dumped into the creek without regard to their possible value. Copper plates were used in the mill. The stamps were all of local make and most of the plant was of wooden structure.

2. A quartz vein in a schistose formation traversed by dikes of granite. The vein traversed both formations having a width of from 1½ to 3 ft., striking north-west and dipping at an angle of 25 deg. This mine was worked during a period of 13 years and has produced 80,855 oz. of gold. These figures are taken from the company books, kept according to the laws of the country. One level was driven through the hill a total length of over 2000 ft., of which 1400 ft. was stope out. A lower level was driven to a length of 1200 ft. when operation ceased. No connection was made. Great difficulty was experienced in inspecting this mine owing to levels being nearly full of ice. The timbers, however, were all sound and the vein still well defined. In this case the mill was built in the bed of a creek about two miles distant, and the ore was hauled in carts. The tailings were dumped into old placer workings and neglected. A cyanide plant was operated with which 1575 oz. gold were extracted. Sumps and percolators were all made of wood, standing in the open, and the result of a win-

ter's freezing in a semi-arctic country can well be imagined.

3. Situated 3½ versts from the above mine is a vein having a width, where exposed, of 1 ft. 4 in. Its strike is north 50 deg. east, and the dip 50 deg. This mine was worked during a period of five years and crushed 5017 tons that averaged 12 dwt. 19 grains. But little work was done. One level was driven to a length of 600 ft. and a lower one 200 ft., when the mine was closed owing to a dynamite accident. In the immediate neighborhood of these two mines are four other auriferous quartz veins. I was told by an old workman that the rock was so rich in places that it resembled a brass samovar, and that the miners used to steal the stone and crush it at home with a pestle and mortar. Labor is plentiful and cheap, while supplies can be freighted from the railway at £4 9s. per ton. Timber and water are obtainable with little difficulty.

About 200 versts from the above mineral belt other quartz reefs have been located, so far eight in number, and of various widths. The vein matter consists of quartz, iron and arsenical pyrites, with gold finely divided and at times visible to the naked eye. The veins have a general strike of north-northwest, with a dip of 45 deg. Tests made by amalgamation only are reported to have shown in many cases very high results. Assays of pyritic ore showed no visible free gold and gave results of 3 dwt. only. It is worthy of note to remark that all these veins are immediately adjacent to what were formerly very rich placer workings. The mines are worthy of a careful study from a dredging point of view.

OTHER MINERAL RESOURCES

Of other minerals in the Baikal province, graphite, asbestos, copper, tin, iron and coal exist in payable quantities. Tin was discovered for the first time on the Onon river in 1811. Numerous excavations spread over the surface, especially in places where the deposits were found to be particularly rich, indicate that the mining of tin was once carried on in early periods by the natives (Bourists). It appears that articles made of tin which were found to a very large extent in the possession of the native population were the chief objects of local trade, whereas there are but very few traces of these articles having been imported from Western Russia during the early part of last century. Tin was worked in 1813, 1815 and 1817 on both sides of the Onon river. The ore

was mostly tinstone accompanied by quartz. Smelting was done in ordinary small furnaces. The first placer deposit of tin was discovered in 1829 by a certain Kooreagin, the leader of a prospecting party. The method applied for saving the tin was the same as that applied to gold. The average amount extracted per ton of gravel amounted to 363 lb. These notes are taken from a very old Russian book which ends by stating that owing to the high cost of production in these days the mines were closed down in 1843. Most of the placers in the Baikal province have been worked by the Czar's cabinet with convict labor. The manner of working the gravels was of the most primitive type and a big loss in gold was the result. Steam-thawing methods are absolutely unknown in the country, and wet ground is passed over unless there is a very small overburden. Owing to the unsystematic method of taking out the pay dirt, a lot of good ground is lost.

It will be noted in my remarks on the Baikal province, that I have dealt only with mines which have been worked and located; it was not my aim to look for new prospects in so vast a country. Attention is drawn to the fact that all my travels were south of the railway as far as to the Mongolian frontier. To the north of the railway I could hear of no quartz mining ever having been carried on, with the exception of that of one English company at present working in the Nerschinsk district.

PROVINCE OF AMURSKI OBLAST

Descending the Amur river, the province of Amurski Oblast is entered at the village of Pokrovka, a day's journey by steamer from the town of Srelinsk, the Siberian terminus of the Trans-Siberian railway. This railway is now being constructed along the left bank of the aforesaid river to connect with the Vladivostok branch line at the town of Kharovsk. The whole of this vast province is a network of rivers and creeks, in all of which gold is found in varying quantities. Ascending one of the largest tributaries about 600 miles, I was enabled to visit many of the old placers from which enormous quantities of gold have been recovered. The extent of these workings is so great that many months could be spent in simply taking a casual look at them. On one river the operations being carried on were so interesting that I give in detail a description of them. The deposit is of an average width of

*Hayes's Cottage, Hayes Road, Bromley, Kent, Eng.

150 yd. and is from $2\frac{1}{2}$ to 14 ft. in depth. The stream flows at from 1 $\frac{1}{7}$ to $1\frac{1}{2}$ miles per hour. Work is conducted every summer by gold robbers, or snipers; in some cases they work the banks, in others they work the bed as far as they are able to reach it by wading out into the water, one man shoveling up to another who washes by the simple panning method. On one spot there were 12 hand-dredges at work, each dredge consisting of two rafts, one 13 yd. in length, the other 7 yd. in length. On the former was the dredge, consisting of a shovel 21 in. deep by $17\frac{1}{2}$ in. wide. On one end of the raft was a windlass with a wire rope attached to the shovel by two chains, one on each side. In the center of the raft for a distance of 10 yd. was an opening 2 ft. wide. The shovel was taken to the far end of the opening and rammed into the bottom of the river by a man who stood on a piece of wood, or rung, let through the shaft; thus the shovel was kept down while the windlass dragged it along the bottom the distance of 10 yd. and to the surface. On the second raft were a long tom and hand pump into which the gravel was dumped and washed, the gold being caught on blankets with 1-in. riffles.

These machines were working in 11 ft. of water. The gravel washed was purely surface, but in spite of this each machine averaged a saving of gold amounting to 328 grains per day of 10 hours. One clean-up, which I personally checked, showed a recovery of 26 grains per cubic yard. This, no doubt, was a particularly rich patch, but samples which I took many miles lower down the same river, from the banks at a depth of only 8 in., showed returns of 13 grains to the ton. One important feature of this river and others in the neighborhood is that they never freeze to bed rock in mid-stream. The method above described is carried on during the months of May, June, July, August, September and part of October. Access to these places is easy, steamers running all the way from Novi-Nikoliesk, at the mouth of the Amur, as also from Kharovsk, the aforesaid railway terminus of the Vladivostok & Amur river lines. All supplies can be obtained at small cost. Timber is plentiful and labor, formerly scarce, is now obtainable, owing to the great influx of emigrants from European Russia.

No quartz mining has, as yet, been carried on in this province, but as evidence of the gold being of local origin, I saw a Russian empty out two saddle bags containing about 40 lb. of coarse gold, two-thirds of which had been hammered out flat to get rid of the accompanying quartz. I was shown samples of quartz containing visible gold, which came from a reef that was being opened up some distance out of my way, and from assays and plans shown me at a later date, it was surprisingly rich. I regret to say that scarce-

ity of time prevented my visiting the district. The country is entirely schistose and is traversed by dikes of granitic rocks and intrusive masses of gneiss, while large areas are covered with the detritus of primitive rocks. Of other minerals large deposits of copper and beds of coal have been located, but as yet no development work has taken place. With the advent of the Amur river railway, great changes will surely take place in this province.

OTHER PROVINCES

The Primorski Oblast, or Maritime, province is as yet but little explored, owing to the Crown's past unwillingness to allow mining or prospecting. From information obtained from old Polish political prisoners, I understand that conditions will change, and as his Majesty, the Czar, has now seen fit to lift his veto and permit exploration, we may, before long, hope to hear of active mining operations. I could obtain but little information of the Yakutsk province, and owing to its inaccessibility from the Pacific sea coast, I decided to leave it alone.

In order to bring out the importance of Eastern Siberia as vividly as possible, I would lay stress on the fact of its easy accessibility from Vladivostok as a seaport, its great water ways for internal communication, its railroads now in active construction, and its cheap labor and abundance of fuel. Having worked there summer and winter and seen it under every conceivable condition, I am, I think, fully justified in expressing this opinion. I can but end these few words in expressing my thanks to the people of the country, who were always ready and willing from the highest to lowest to help a foreigner over any little difficulty and give him of their best in hospitality.

Laboratory Methods for Making Alloys of Iron and Vanadium*

By W. L. MORRISON†

Binary alloys of pure iron and vanadium free from carbon can be conveniently made by two methods: (1) Goldschmidt's method, using pure aluminum and hammer scale from puddled iron, and mixing a little ferrovanadium with charge. (2) By use of electric resistance furnace, using a crucible in the resistor to melt puddled iron and ferrovanadium.

Goldschmidt's process is very simple and requires but little apparatus. The iron oxide or hammer scale is analyzed and sufficient aluminum is added to combine with the oxygen present; usually 5 per cent. excess is added on account of

*Brief of thesis work done at Case School of Applied Science.

†1052 East Twenty-fourth street, Erie, Penn.

oxidation of some aluminum by oxygen in the atmosphere.

The reaction between the oxide and aluminum is brought about by external heat, or by ignition of a mixture (barium peroxide and aluminum) which is usually placed at the bottom of the charge and electrically ignited. For small charges of 2 lb. or less, it is most desirable to apply external heat in order that the reduced iron may separate cleanly from the slag. If internal ignition were used the cold walls of the containing vessel would chill the molten iron before it separated from the slag. A gas furnace or an ordinary forge is very convenient for heating the crucible containing the charge. The resulting alloy upon solidifying may then be removed and forged in a bed of quicklime out of contact with carbon since alloys are to be carbon free.

The electric furnace was of the resistance type carrying four 1-lb. magnesia crucibles. The resistor was baked carbon, 16 and 17 mesh in size. The terminals were of 2x4-in. carbon. Carbon terminals were used in preference to graphite on ac-

The Engineering & Mining Journal, N. Y.

RESISTANCE FURNACE

count of their low heat conductivity. The walls of the furnace were of common fire-brick, the interior being lined with silex. The furnace was covered with silex slabs to prevent radiation losses. In order that the bottom of the crucibles might heat evenly, the crucibles were placed on a small graphite block. A thin layer of decomposed graphite was used between resistor and carbon terminals to give better contact. The construction of the interior of the furnace, as shown in the accompanying illustration, is for the purpose of giving uniform resistance throughout the bed.

The source of current was a 33-kw. Westinghouse alternator delivering 1100 volts. Six transformers of ordinary line type were connected in parallel and the secondary coils so connected that 110 or 55 volts could be used. During all the runs 110 volts were used. The rise in amperage was so slight that the iron melted before the wattmeter registered 20 kw. The time required to melt 1 lb. of puddled iron in each of the four crucibles was $5\frac{1}{2}$ hours. Power used was 65 kw.-hours. The puddled iron was introduced into the crucibles before the heat, then ferrovanadium after the melt. Many different crucibles were tried and the magnesia was the only serviceable one.

Determination of Lead and Cadmium in Spelter

By ERIC JOHN ERICSON*

In a former article in the JOURNAL, July 25, 1908, I described a rapid technical method for the determination of lead in spelter, requiring only about one hour's time for execution. This was the first application of my method to spelter and may be designated as method No. 1. I desire now to present our latest scheme, or method No. 2, which gives lead to the thousandth of a per cent. whereas the first gave accurate results to 0.01 per cent. Besides greater accuracy the new method affords at the same time a separation from cadmium since the filtrate from lead may be used for the former's determination.

Solution of the sample is here effected by dilute hydrochloric acid according to Oswald Günther¹ or dilute sulphuric acid (Nissenson²) until nearly all zinc is dissolved. The insoluble lead and cadmium is filtered off and dissolved in dilute nitric acid. This procedure makes it possible to operate on a larger sample, and each 0.1 c.c. of the potassium permanganate solution (0.568 grams to the liter) equals 0.001 per cent. lead. Particular care must be taken not to dissolve the sample too fast as there is danger of cadmium going into solution. In cases where lead alone is wanted the dissolution may be hurried some without impairing the accuracy. In this laboratory it is customary to run duplicate determinations on spelter, chiefly to guard against and detect any possible loss of cadmium.

The substitution of trichloroacetic acid according to Fox³ for any one of the mineral acids usually employed in separating cadmium and zinc, has been found advantageous, since it is not dissociated to the same extent as hydrochloric or sulphuric acids, and even concentrated solutions do not prevent the complete precipitation of cadmium. In the case of mineral acids the strength must be kept within narrow limits as is well known. A slight excess prevents the precipitation of cadmium, while insufficient acid causes much zinc to be precipitated along with cadmium and makes several reprecipitations necessary. By means of trichloroacetic acid only one reprecipitation is called for, unless it has been found that more zinc remained undissolved originally than was aimed at, as may be seen later.

METHOD NO. 2 FOR SPELTER

Weigh out to 2 grams of the sample and place in a No. 3 Griffin beaker. Add

50 c.c. distilled water, and 50 c.c. hydrochloric acid (1.10 sp.gr.); warm gently and from time to time add more dilute hydrochloric acid until nearly all zinc is dissolved and only 1 to 1.5 grams remain, plus the insoluble lead and cadmium. Do not hurry the dissolution when cadmium is to be determined. A good plan is to add insufficient acid at the start and allow to stand over night. In the morning, continue the addition of acid gradually and give it time until the proper stage has been reached. Filter off metallics and wash thoroughly with hot water (not necessarily until all chlorides have disappeared).

Transfer whatever metallics are on the filter back into beaker by means of a fine jet of water. Now add 10 c.c. concentrated nitric acid, boil until brown fumes cease to appear and filter if traces of tin or antimony are indicated, which is seldom the case. If filtered and washed the volume will probably be large enough. If not add 75 to 100 c.c. water, 30 c.c. strong ammonia and 4 to 5 grams solid ammonium persulphate. Should the lead be unusually high, say over 1 per cent., it is best to add the persulphate before the ammonia. This insures perfect oxidation even where lead runs high, but requires a standardization of the factor, as in the case of lead concentrates. Boil five minutes, allow the liquid to settle 10 min. and filter while warm through double 11- or 12.5-cm. filters. Wash four times with hot 10-per cent. ammonia water and five times with hot water.

Transfer filter with precipitate back into beaker in which precipitation was made; add 25 or 50 c.c. hydrogen peroxide solution (10-40 c.c. H₂O₂ U. S. P. strength to the liter) depending on the percentage of lead. Stir until dissolved, add 15 c.c. nitric acid (1.20 sp.gr.) plus 100 c.c. water and titrate the excess of hydrogen peroxide by the standard permanganate solution. For instance if 25 c.c. H₂O₂ blank require 60 c.c. KMnO₄ and the sample 28.5 c.c., then the lead equals 0.315 per cent. The accompanying examples taken from practice show how closely the new method checks with the chromate determination.

	Ericson Method, Per Cent.	Gravi- metric as Chromate, Per Cent.
Refined spelter.	0.082	0.083
Refined spelter	0.043	0.044
Prime western spelter.	0.530	0.538
Prime western spelter.	0.533	0.531

CADMIUM DETERMINATION

For the determination of cadmium, evaporate the ammoniacal filtrate from lead until it is nearly neutral and zinc and cadmium commence to be precipitated, add 35 c.c. dilute sulphuric acid (1:3) and boil down to about 150 c.c. volume. Saturate with hydrogen-sulphide gas, add 25 c.c. water and warm. Sometimes it is necessary

to add a few cubic centimeters of dilute ammonia to start precipitation. Allow the precipitate to settle, filter through double filters and wash. Test filtrate for cadmium and if none is present reject it. Redissolve the cadmium sulphide, contaminated with zinc sulphide, in dilute hydrochloric acid (1.10 sp.gr.) and wash with water. If copper is present its sulphide remains insoluble on the filter. It may be ignited and weighed as copper oxide.

The filtrate containing cadmium and zinc chlorides is neutralized with dilute ammonia, and trichloroacetic acid dissolved in water added until the precipitate is redissolved. Dilute to about 150 c.c. volume and reprecipitate, adding hydrogen sulphide and water alternately. Settle and determine by any one of the usual methods,⁴ preferably as sulphate or phosphate.

Should the color of the cadmium sulphide from the sulphuric-acid solution be yellow, it indicates considerable zinc, which may be largely eliminated by boiling the solution of the mixed chlorides to expel hydrogen sulphide, adding sodium hydroxide in slight excess to precipitate cadmium, filtering, washing and redissolving the cadmium hydroxide on the filter in trichloroacetic acid, diluting and reprecipitating with hydrogen sulphide, when a pure cadmium sulphide will be obtained. Should the duplicates not agree, reprecipitate the one giving the highest result since it may still retain some zinc. If still too far apart, repeat the entire analysis.

HIGHER FACTOR FOR METHOD NO. 1

In this connection I wish to add to my previous article concerning ores that further investigations have shown the factor in the equation, 1.02x iron value of permanganate = lead, to be correct on spelter and alloys wherever a direct determination can be done, but it is too low on ores, owing to slight losses as lead sulphate and carbonate in the preliminary separation. The factor 1.05 is recommended, hence weigh out 1.05 grams instead of 1.02 grams as originally suggested. As the lead content in the zinc ores is usually very low, the difference in factor does not cause any serious error, but in lead concentrates it would be considerable. This was realized at the outset and, therefore, suggested to check the potassium permanganate solution against a standard lead ore put through under identical conditions. To insure perfect oxidation in high-grade lead concentrates, add the ammonium persulphate to the nitrate solution before making it ammoniacal.

According to the fourteenth annual report of the Rand Mines, the cyanide works treated 3,105,242 tons of ore during 1908. The yield was 391,736 oz. of gold.

Bitumen and Oils in West Africa

By T. HUGH BOORMAN*

Early in 1906 much interest was evinced in London at the discovery of bituminous deposits in Lagos and southern Nigeria. Syndicates were at that time marketing stocks in companies for their development. I was at that time much amused at an effort being made to compare the asphaltic oil deposits with Trinidad and Bermudez asphalts and at the queer errors that ensued in the attempt to make comparative analyses.

Samples of "Nigeria asphalt" then received were described as a mixture of water and gas, bitumen, organic matter (not bitumen) and fine mineral matter. These constituents were present in the following proportions: Water and gas, 23.33 per cent.; bitumen, 45.75; organic matter (not bitumen), 2.90; mineral matter, 28.02; total, 100 per cent. The asphalt was first found in one concession comprising about 300 sq.m., bounded on the west by the Oshun river, on the east by the Oni river, and on the south by the Lekki lagoon; the second concession, comprising 100 sq.m., was situated north of the village of Aiye, approximately 12 miles by land and 120 miles by water from Lagos.

Another concession is near the Oluwa river. Here a deposit of bituminous grit outcropping in the slope at the foot of a bench is to be found. The top of the stratum was about 6 ft. above the level of the low ground near the river. A small shaft was sunk in the bituminous stratum for a depth of 6 or 7 ft. Some pieces cut from the ground at the top of the shaft yielded from 15 to 74 per cent. bitumen. This area is about 15 miles by land and 120 miles by water from Lagos.

An accompanying table shows the comparative composition of crude Trinidad, Bermudez and Nigeria asphalts. The areas of the deposits compare as follows: Trinidad, 127 acres; Bermudez, 900 acres; Nigeria, 216 acres (located in 1906). Other tables show a comparison of refined asphalts, and a comparison of the ultimate composition of pure bitumen from asphalts.

WEST COAST OF AFRICA

From reports made in December, 1908, to various companies, it appears that petroleum oil with an asphalt base is probably present in immense quantities on the west coast of Africa, and that the material originally proposed to be marketed as bitumen is of the nature of Santa Cruz bituminous sand, since the chairman of the Nigeria Bitumen Corporation stated that "the samples of bitumen which were tested showed the presence of sand, which had evidently been torn out of the rock in its upheaval," and that "the light oil which that

sand contained had evaporated and left it in the form of bitumen." They had endeavored to extract the bitumen, but met with great difficulties, the greatest of these being that of transport. They believed that when the colony opened out they would be able to make a profit on their bitumen, not only by exporting it, but in its use in the colony itself.

Sir Boverton Redwood said that when the previous meeting was held he emphasized the fact that the company was engaged in determining whether or not pe-

vestigations which are necessary before one can class a new discovery as a commercial asset. These gentlemen have told me that they are satisfied in every respect, and in what I am saying now I am taking it for granted that commercially and colloquially speaking, we have struck oil. I am taking it for granted not only that oil has been found, but that the conditions surrounding this find are of a nature to make it possible to place it on the market in competition with the oils of Russia and America."

Exploration and development work had already been carried out by the Nigeria Investment Company for two years prior to deep drilling, and test bore holes were put down under the superintendence of Bernard A. Collins, a mining engineer. This gentleman says: "I am now satisfied that the oil will be found by deep boring, and that the bitumen can be mined in unlimited quantities and of a high grade, and that the most important point now to be decided is that of outlet toward a shipping port."

The directors of the Nigeria Bitumen Corporation, Ltd., in their recent annual report to the shareholders state: "The fact that after passing a small show of oil in sandrock, oil was struck at a depth of 633 ft., which rose to within 98 ft. of the surface and did not decrease after four days' baling; that after getting the casing down farther and drilling an additional 26 ft. the manager reports that the oil is increasing, and that the production was 145 bbl. per day, is absolute proof that the quantity of oil in those strata is large, and that there is considerable pressure behind it."

According to the Right Hon. W. S. Churchill, late under-secretary for the Colonies, the Colonial Office has been impressed with the potentialities connected with obtaining mineral oil, as is shown by the fact that even creating a precedent was not permitted to stand in the way and a considerable grant of public funds to aid in drilling operations for mineral oil was authorized. That the Colonial Office and its advisers were not mistaken in their prognostications is evidenced, it is claimed, by the fact that oil was found in the western Nigeria, in addition to the bitumen November, 1908, and every succeeding cable relating to the further boring operations goes to confirm the view that southern Nigeria, in addition to the bitumen which is to be found over large areas, is in the very near future to become a petroleum producer, with all its numerous uses and the by-products which follow in the wake of this important natural development.

It is proposed to send out at once a staff of practical oil drillers from Canada. It would seem to me more desirable to have them sent from California as I cannot but believe that the deposits discovered are of a very similar character to some of those on the Pacific coast.

roleum was obtainable in Nigeria in commercial quantities, and he now had the pleasure of congratulating them upon an affirmative answer of a most unqualified character having been given to that question.

At a meeting of the Nigeria Investment Company, held in London on the same day, C. H. Harley Moseley, ex-colonial secretary of Lagos Nigeria, said that at the recent Franco-British exhibition, while the known products of southern Nigeria were very fully represented at the exhibition, there was one product that had only recently been discovered, but the existence of which has long since been more than suspected, which did not figure among the exhibits; that product was mineral oil. Mr. Moseley said: "Gentlemen who are well acquainted with facts and can speak authoritatively have made a profound and practical study of the matter, and have satisfied themselves by expert reports and by all those other in-

Amatrice, A New Gem Stone of Utah.

This Matrix Stone Consists of Variscite and Chalcedony, with Wardite or Possibly Other Hydrous Aluminum Phosphates, and Quartz

BY EDWARD R. ZALINSKI*

Recently a gem stone has appeared on the Salt Lake and eastern jewelry markets which on account of its beauty and individuality is attracting considerable attention. Amatrice is essentially a matrix stone, and consists of the minerals variscite and chalcedony, with wardite or possibly other hydrous aluminum phosphates and cryptocrystalline quartz. The amatrice locality was discovered in 1905, but until the past year little development or mining was attempted. The first locations were made for copper but assays showed no copper present and the claims were abandoned. It is the purpose of the present article to briefly describe this new gem material together with its geological occurrence.

locality is about 20 miles northwest of Mercur and is mentioned under utahlite, in "Mineral Resources" for 1905, pp. 1323 and 1350, as a new occurrence of this gem stone. The variscite here, however, differs in its physical character from that of the Clay cañon occurrence, and partly on this account and also from the fact that the name "utahlite" is very similar to "utahlite," a basic ferric sulphate found in the Tintic district, the same amatrice was given to the variscite and associated minerals, from the locality under consideration. The gem is described by Douglas B. Sterrett in the advance chapter from "Mineral Resources" for 1907, pp. 42 and 43, under the heading "Amatrice or Variscite Matrix."

exists on the property, and at present is hauled a distance of 16 miles.

GEOLOGY

The country rock in the neighborhood of the amatrice deposits is limestone and quartzite. On the surface the limestone is a light grayish color with numerous silicious and cherty portions which weather out above the softer stone forming lumps and nodules. Where freshly broken the rock is dark blue. Amatrice is found in certain beds of this cherty limestone along fissures which strike north 20 deg. west (magnetic reading), and dip 70 to 80 deg. west. Northeast of Amatrice hill on the footwall side of the amatrice beds, silicious limestone ap-

AMATRICE HILL IN CENTER FOREGROUND

OUTCROP OF TYPICAL QUARTZITE

The name "Amatrice" was given to it by the owners because it is fittingly descriptive of the stones. It is derived from "matrice" a synonym for matrix, prefixed by the letter "A" of the word American to denote their American origin. Up to date they have been found at only one locality in Utah, though variscite of a different type is found at another point.

In "Mineral Resources" for 1894, Sixteenth Ann. Report U. S. G. S., pt. 4, p. 602, mention is made of a compact nodular variscite found in Clay cañon about 2 miles south of Mercur, Utah. The name utahlite was suggested for this occurrence of variscite, but it is also known as chlor-utahlite. The amatrice

LOCATION

The amatrice mines are situated in Tooele county about 40 miles southwest of Salt Lake City and about 8 or 9 miles west of Stockton, on the S. P. L. A. & S. L. R. R. The property lies in the foothills of the Stansbury range, on the eastern slope, a few hundred feet above the valley. The ground slopes from Amatrice hill easterly over the old lake-bed terraces toward the railroad. Amatrice hill is a small rounded knob of elliptical shape, with greatest length north and south. It rises 200 ft. above the adjacent bench lands on the northwest side of Rush valley, and lies about 1 1/2 miles north of Hickman cañon. By barometer the altitude is 5700 ft. The surroundings are arid, but some dry farming is done in the neighborhood. No water

pears but normal limestone is again exposed in a small gulch. The ground rises from here and the rock becomes more silicious going up hill, passing through beds of granular quartzite or sandy silicious limestone to typical quartzite at the top of the rise. A bed of the latter outcrops prominently about 15 ft. above the surface and for several hundred feet in length. All beds are conformable to the amatrice-bearing limestone. So far no amatrice has been found in the quartzite. Along the south side of Amatrice hill the limestone is fossiliferous. The bedding is well exposed and strikes north 20 deg. west dipping 60 deg. west. Fossils found here proved to be of Upper Carboniferous age.

OCCURRENCE

Amatrice occurs in a crushed and frac-

*Mining engineer, University Club, Salt Lake City, Utah.

tured zone in the limestone which strikes approximately parallel to the bedding. It appears in places on the outcrops in green or yellowish concretions. Where exposed in the open-cut workings it is found in nodular masses from the size of a pea to several inches in diameter. These are intimately associated with silicious material, in many cases being cemented together in irregular bunches and coated and mixed with chalcodony. The rock is cut by fissures striking north 20 deg. west and dipping 70 to 80 deg. west. These appear to have been the mineralizing fissures and are the strongest ones noted. They show limonite staining and in some cases small particles of fresh pyrite inclosed in a matrix. Chalcodony is one of the most abundant minerals of the deposits, while fractured and iron-stained chert is common. A second set of fissures striking north 60 deg. east cuts the limestone bedding at nearly right angles and dips steeply to the north; they show no mineralization. The amatrice-bearing ground is of limited extent. The gem has been found only on the eastern slope of Amatrice hill, over a distance not more than 350 ft. in a north-south direction and roughly estimated 150 ft. east and west. Development work indicates the deposit to be of local origin. No gem in place or amatrice float has been found to the north or south. The vertical depth so far proved has been less than 12 ft. beneath the surface, but amatrice has been found lower down the hill 30 ft. vertically below the present workings.

MINERALOGICAL NOTES

As mentioned before, the chief constituent minerals of amatrice are variscite and chalcodony. Wardite and probably other hydrous aluminum phosphates occur, as do quartz and chert. Wardite and variscite occur together and furnish the chief coloring material. The color varies from pale green through all shades of green to deep green; the latter color is usually translucent. The related phosphates are yellow, gray and white, while in the matrix the chalcodony and chert vary from white to dark red, yellow and brown. An oolitic and wavy structure is sometimes apparent in both the variscite and matrix. Small nodules of variscite are cemented together with chalcodony and all possible combinations of these two minerals occur. Crushing and fracturing have taken place at successive periods, with subsequent deposition of minerals of different shades in the cracks and seams.

Amatrice is hard and compact; it breaks with a conchoidal to uneven fracture. Variscite and wardite are rated at 4 and 5 in the scale of hardness respectively, but so intimately are they associated with

chalcodony and in places impregnated with it that the hardness approaches that of this mineral. A rock section under the microscope would show the thoroughness of this impregnation. In some cases it may be seen in hand specimens. Fragments of the apparently pure variscite will readily scratch window glass. The individuality and charm of amatrice which distinguishes it at once from normal variscite is due to the wide range of colors of the minerals composing it and the combinations of color and structure these minerals make with one another.

DEVELOPMENT

Development consists of a tunnel and open cuts on the eastern slope of Amatrice hill and has exposed three distinct types of amatrice, in workings some distance apart. These types are called apple-blossom, cobweb, and jade. The apple-blossom type resembles white blossoms on a green background. It is due to fine concretions of variscite intimately mixed with portions of the white phosphate, and associated with chalcodony. Dark-brown chert adds contrast to the variscite.

The open cut where the cobweb type occurs is about 250 ft. southwest of the apple-blossom occurrence. In the face of the cut fissures striking north 10 deg. west and dipping 80 deg. west, carry nodules of yellowish phosphate material mixed with chert and chalcodony. Variscite may or may not occur in these nodules. When present it is irregularly distributed. Light-green variscite with a network of deep-green lines gives rise to the cobweb or turtle-back type, which occurs with a matrix of different colors. The cobweb amatrice is due to fracturing of one generation of variscite and matrix, and recementation with variscite of a different color or by chalcodony, with often hematite or limonite staining along the cracks. This type carries some deep translucent green variscite with a tendency toward the jade type.

In the jade type of amatrice the variscite is a deep translucent emerald to apple green and resembles jadeite in color. The open cut where it is mined is the farthest southwest of any of the present workings. A specimen from here showed the limestone almost entirely replaced by silicious material. The variscite is in nodular masses $\frac{1}{4}$ to $\frac{3}{4}$ in. in longest diameter, and also of irregular outline. The color changes are gradual or abrupt; the abrupt changes are often due to fracturing and displacement but also to deposition of variscite of widely different colors. On the border the nodules are frequently translucent green, and light green or nearly white in the center. They may contain fragments of chert or silicified country rock. The matrix is ex-

tremely silicious surrounding the nodules and carries large amounts of chalcodony.

GENESIS

Regarding the genesis of amatrice the following points may be mentioned: The variscite and chalcodony were deposited in a crushed and fractured zone in the limestone and replaced the rock in the neighborhood of the mineralizing fissures. Pyrite in small fresh crystals and veinlets is sometimes present with the amatrice; it furnished the limonite by oxidation. Movement occurred during and after the deposition of the gem-forming minerals, and was one of the important factors in producing amatrice, though some of the peculiar structure cannot be assigned to this cause alone. A large amount of chalcodony was deposited and brecciation of both the variscite and matrix took place. The component minerals were deposited at successive periods and possibly under different conditions.

PRODUCTION AND USES

Amatrice is used in all kinds of gold jewelry. The colors are in harmony with the color of gold and it is mounted in scarf pins, rings, cuff links, brooches, lavalliers, necklaces, pendants, etc. It is also used in art jewelry on account of the individuality of the separate gems. The extreme irregularity of the variscite, chalcodony, and cementing medium, with its hardness and capability of high polish, furnish material for an ideal matrix stone. After cutting and polishing it is difficult to find two gems alike. Amatrice is usually cut *en cabochon* or elliptical with a low convex surface. It is sold by the carat and ranges in price from \$1 to \$3.

According to "Mineral Resources," the production of finished gems from the material mined in 1907, amounts to about 20,000 carats. In 1908 the Occidental Gem Corporation reports production in the neighborhood of 45,000 carats, a portion of which was exported to Europe. During the latter part of the year they were unable to supply the demand on account of lack of manufacturing facilities. The company is now installing its own lapidary plant in Salt Lake City.

The oilfields of the island of Sakhalin, off the Siberian coast, have long been productive. A company composed of Russians, Germans and Chinese, has secured a concession to a large tract north of the town of Nikolaievsk, and will begin to explore it as soon as the necessary machinery can be secured from Germany.

The actual percentage of extraction of gold at the Rand Mines, in 1908, according to the fourteenth annual report, was 04.421.

Microstructure of Copper Examined with a New Etching Reagent

BY ROBERT R. ABBOTT*

During 1906, in attempting to examine the structure of the contact between copper and steel, as formed in the various methods of rail bonding, I was confronted with the difficulty that none of the etching reagents in present use would bring out the structure of the copper sufficiently to permit the required examination, although the development of the structure of the steel side presented no difficulties.

method of etching with it which has given the best satisfaction is to polish the section very carefully on the Sauvour machine and, after washing free from the rouge, place it in a dish of boiling water, add sufficient persulphate to make about a 10 per cent. solution. Allow it to boil until the brightly polished surface becomes dull and crystalline. This usually requires from one to 10 seconds. Wash the specimen and dry in the usual way with alcohol. Quite often a film of red oxide forms on the surface, which will disappear in a few seconds; if it does not, a slightly stronger solution will be required. This method gives very good results with copper alloys.

phosphorus. Another peculiarity of the structure of pure copper is the fur-like appearance under the higher powers of magnification. In many cases this might be mistaken for a eutectic structure. Figs. 2, 3 and 5 show this excellently.

Fig. 6, 175 diameters, shows the structure of electrolytic copper. The specimen was taken from a cathode plate. This radiating structure was not met with in any but electrolytic copper. Fig. 4, 475 diameters, is a longitudinal section of copper wire after drawing; it was made of lake copper. Fig. 5, 475 diameters, presents the structure of the wire shown in Fig. 4 after annealing. Fig. 7, 875 diameters, shows the structure of

FIG. 1

FIG. 2

FIG. 3

FIG. 4

FIG. 5

FIG. 6

The literature at hand was carefully reviewed in the hopes of finding some previous work along this line, but with little success. In fact, as far as I am aware the only previous microphotographs which have been published showing with any degree of clearness the true structure of copper were those of Professor Huntington, in the JOURNAL, of Dec. 16, 1905. Professor Huntington etched his specimen with nitric acid. This reagent would not give detail enough.

I then began experimenting with various methods of etching and finally found that ammonium persulphate ($(\text{NH}_4\text{SO}_5)_2$) gave excellent results. The

The accompanying photographs give a few examples of the structure of copper and also the structure of copper containing copper oxide and phosphorus. Fig. 1, 175 diameters, shows the copper after having been annealed five minutes out of contact with the air and just below the melting temperature. Fig. 2, 475 diameters, and Fig. 3, 875 diameters, are of cast copper. The different shades in the crystals are due to the various orientations of the crystal axes. The tendency to form what are apparently twin crystals is remarkable, in fact, sufficient etching has usually brought out traces at least of twinning on almost every crystal. This tendency decreases with the presence of very small amounts of copper oxide or

native copper coming from the Calumet & Hecla conglomerate. Fig. 9, 875 diameters, is a specimen of copper which has been melted in the air and kept in the liquid condition for some time; it is known as burned copper. The large white areas are the Cu_2O and the spotted and striped areas consist of the eutectic of copper and copper oxide. A very small amount of copper oxide can be detected under the microscope; just how small I have not been able to determine thus far, but hope to do so soon. Fig. 8, 875 diameters, shows the appearance of copper containing 0.31 per cent. of phosphorus. It consists, apparently, of an excess substance and eutectic. The further study of the microstructure of

*Case School of Applied Science, Cleveland, Ohio.

copper and copper alloys, as brought out by etching with ammonium persulphate is now being carried out in this laboratory.

The Mysore Gold Mine

SPECIAL CORRESPONDENCE

The report of the Mysore Gold Mining Company, of Mysore, India, for the year 1908 is again a record of prosperity. The mill crushed 206,170 tons of ore, from which gold to the value of £848,145 was recovered, or an average yield of 82s. per ton, just under 1 oz. fine gold per ton. The profit earned on revenue account was £458,285, out of which £350,055 was paid in dividends, equal to 115 per cent. on the nominal value (10s.) of the shares. The large difference between profits and dividend is due to the adoption of the policy of meeting expenditure required on capital account out of revenue and not by the issue of new shares. During the year under review about £70,000 was spent out of revenue on new buildings and ma-

reserves is not given. A new vertical shaft is to be sunk in the McTaggart's section to cut the lode at 1485 ft., which will correspond with the present 2460-ft. level. This shaft is badly needed for facilitating hoisting and for ventilation. Edgar's shaft, which has been sunk vertically 2628 ft., is expected to be equipped for hoisting by the end of the year. This shaft will command the lower workings of the Ribblesdale section and will be of great benefit to the general working of the mine.

The mill consists of 210 heads of stamps, the majority of which are in good running order. Having regard to the good grade of ore being met with at the deepest points reached, the prospects of the company may be said to be as satisfactory as at any period of its history. The mine may be regarded as the best in the Kolar goldfield.

Determination of Copper

John W. Root (*West. Chem. and Met.*, W. pp. 260-270) describes in de-

residue is placed in a No. 3 beaker and the cup washed out with nitric acid by warming the nearly filled cup until any remaining oxide is dissolved. The acid in the cup is transferred to the beaker and the solution evaporated nearly to dryness and the determination finished by either the cyanide or iodide method.

The essential details are to have the copper-sulphate solution dilute and hot and to add the hot hypo solution carefully. Also the solution should be boiled hard till clear, the precipitate dried thoroughly before burning and the burning conducted at a temperature low enough to avoid fusing the native sulphur and yield a clean dry residue of copper oxide. This method insures a complete precipitation of the copper.

The known tin deposits of Alaska that promise some future commercial importance are situated in the extreme western part of Seward peninsula. Adolf Knopf states that at present four localities are being prospected for tin. They are in-

FIG. 7

FIG. 8

FIG. 9

chinery. For the last three years the operations of the company have been as follows:

	Tons Crushed.	Gold Realized.	Divi- dends.
1906	185,900	£809,413	£418,674
1907	194,838	820,114	409,071
1908	206,170	848,145	350,055

The mine superintendent gives a favorable report on the development of the mine. At the Ribblesdale section at a depth of 3900 ft. the reef has a width of 2 ft. 9 in., and a value of 28 dwt. At Tennant's section the reef at the deepest section (about 2500 ft.) is 5 ft. wide, assaying 58 dwt. In the southern end of the property, McTaggart's section, the developments are also good in the bottom. At the deepest point worked (2470 ft.) the lode was 6 ft. wide, assaying 24 dwt.

The ore reserves at the end of the year were estimated at 969,920 tons, excluding a quantity of low-grade ore, representing an ore supply sufficient for five years for the mills at the present increased rate of extraction. The average value of the ore

tail the "hypo" method for the determination of copper. The method while not new, is not in as general use as it deserves. The analysis is conducted in the usual manner up to the point of the precipitation of the copper with zinc or aluminum. At this point the copper-sulphate solution is diluted with water to half fill a No. 4 beaker, the beaker stirring rod inserted into the beaker, the beaker covered and its contents brought to a boil. A boiling solution of hypo (7 to 10 grams in 100 c.c. of water) is then cautiously added to the copper solution and the solution boiled hard from 15 to 30 minutes until clear.

The precipitate, which is more or less granular, is filtered through a No. 597 filter and washed well with hot water. The filter containing the precipitate is placed in a small porcelain cup, dried and ignited at a temperature just sufficient to burn off the free sulphur and consume the filter paper, gradually raising the heat until all the carbon is burned. The ignited

clued within an area of 400 square miles, situated about 100 miles northwest of the city of Nome, the supply point of the region. In geographic order from north to south, these four localities are Ear mountain, Buck creek, Cape mountain and Lost river. The tin occurs in both placer and lode form. Up to the close of 1908 the total production of the entire region was 160 tons of cassiterite concentrates, all of which, except a few tons from lode deposits, came from the stream tin of Buck creek.

Manganese ore has been discovered in the Devil's peak (Table mountain), Cape Colony, according to the *Cape Times*, Feb. 27, 1909. The deposits are believed to be rich and cover an extent of about 1000 acres.

The development work in the Rand Mines during 1908 was 122,726 ft. (*Fortieth Annual Report*). This includes all shafts, winzes, drift and crosscut work.

A Comparison of Coal-cutting Machines

With Statement of Costs, Showing Economy of Machine Mining and a Discussion of Compressed Air, as Compared with Electric Power

BY SYDNEY F. WALKER *

When I inquired into the working of coal-cutting machines in 1900, the disk machine, with very few exceptions, was favored by all colliery managers in the United Kingdom who had adopted coal-cutting at all. The punching machine had hardly obtained any footing; it had been tried at several collieries in the different coalfields and had been abandoned in nearly all of them; the reason being the jarring which the runners received when working this machine. On the other hand, I was told by a colliery manager in Scotland who had adopted the Harrison puncher machine for a short time, that some of his men got into the trick of handling them after a short time, and were able to do as well with them as the Americans who came over to act as instructors.

In America then and now, the puncher machine has always been a great favorite. On this side of the Atlantic, the puncher has made considerable progress, but as explained below, it is largely by altering its character, though there are signs that in its original form, it will have an increasing vogue. In 1900 the disk machine was preferred before all others, for longwall work, because it could be relied upon, with reasonable care and attention, to keep going, providing that power was supplied to it. If the power was there, a well made disk machine would go through almost anything. I have recorded more than once, where a disk machine electrically driven, has used 100 h.p. for a short time, while 50 h.p. for a limited interval was fairly common. The important thing was, the machine would keep on working.

In one case which came under my notice, several machines had been continuously at work for five years, at the face in a colliery in Yorkshire. At that time, in 1900, the bar machine, though it was older in its inception than the disk machine, and was much liked, was not largely used, because it was somewhat unreliable. The gearing was liable to become much worn, the motor driving the machine was apt to vary its speed considerably, according to the different substances the bar was cutting through, and there were other troubles. Since then, most of these troubles have been overcome, and the bar machine may now

be said to be a thoroughly practical apparatus, and to take its place in the contest with other machines, on strictly commercial lines.

At the present time, there are several makers of bar machines, where there was only one in 1900, and there are two forms of this machine as described below.

THE JIB MACHINE

In 1900, the jib machine, which had been introduced much earlier by Archibald Baird & Company, of Scotland, and by Winstanley in Lancashire, had been abandoned. At the present time the jib machine has been resuscitated, but in a different, and in a more practical form. The present jib machine is really a modification of the chain-heading machine, that has been upon the market for a long time, and that is so largely used in the "pillar-and-stall" system employed in American coal mines; this machine has also had a large vogue in the United Kingdom for driving headings.

In the present jib machine which is made by several firms, the chain with its cutters, runs around a frame, just as in the heading machine, but the frame is held between two narrow plates, which project under the coal, just as the disk does. The chain carries pick shaped cutters and does the same work as the disk machine but in rather a different manner.

The operation of the four machines mentioned, the puncher, the disk, the bar and the chain, are distinctly different though all are aiming at the same result, to imitate the work of holing done by hand labor in the past, and if possible to improve it. The puncher machine in the original form, consisting of the drill with its air cylinder behind it, carried on a pair of wheels, appears to answer more nearly to the work of hand holing than any of the others. Strictly speaking, the puncher is a pick, with a power machine behind it, wielded by the runner and it has nearly all the flexibility of the hand pick.

Whenever a machine is arranged to take the place of hand labor, the machine is always at the disadvantage that it has not the flexibility of hand work. In the case of holing under the coal for instance, the skilled miner could work around balls of pyrites, and could literally pick his way, on the line of least resistance. The

puncher machine arranged with its wheel carriage, is able to closely follow this. On the other hand, the bar and the disk and the chain, all have to cut more or less uniformly, and more or less blindly. There is no flexibility about them, except as will be described below. The action of these three again is different.

The cutting tools of the disk machine remove the dirt, or the coal, whichever they may be cutting in, by scraping. It is more or less the action of a carpenter's chisel. The bar machine with its reciprocating and rotary motion, claims that its action is that of the pick, but the work is divided up among a large number of very small picks. In the chain machine it is claimed by the makers, that the action of the cutting tool is closely similar to that of the pick, and the material brought out by the cutters, bears this out to a large extent in a great many instances. With the disk and bar machines, the holing dirt is usually dust, with the chain-jib machine the holing substance is brought out in small lumps.

MERITS OF THE DIFFERENT MACHINES

The bar machine has claimed an advantage over the disk, that in case of the coal settling down upon the machine, the friction is nothing like as great, and the bar could go on working, while the disk might have to be stopped; this is evidently correct. Both the bar and the chain machines have the great advantage that the coal can be spragged right up to within a few inches of the cutting tool itself, while in the case of the disk the spragging of course, has to be some distance behind the disk itself. Further, the chain machine appears to have a distinct advantage, in the fact that the plates between which the rollers upon which the chain-runs are held, does not move in the same sense as the disk moves. It moves on as the machine moves, and as the cut moves, but it is not in continual motion like the disk is, and therefore the friction is considerably reduced. This is borne out in practice by the fact that the chain machine works with approximately half the power of the disk machine for any given work.

The bar machine also works with considerably less power than the disk machine, and approximately the power for chain and bar machines for the same work, are about equal. By the same work

*Consulting engineer, Bloomfield Crescent, Bath, England

is meant, cutting in the same material, and to the same depth. It is understood of course that the power required for cutting in different materials, is different. The smallest power required is for cutting in soft kinds of coal, the largest for cutting in hard fireclay. Both the bar and the chain machines also have the advantage, which is now a thoroughly practical one, in the machine on the market, that they are able to avoid obstacles, such as the nodules of pyrites that are the *bête noir* of the coal-cutting machine. Both the bar and the chain are arranged to be inclined upward or downward, so as to avoid any piece of hard substance, and that without interfering with the general arrangement of the machine platform.

All three forms, the bar, the chain, and the disk, are now arranged to cut at practically any level that is met with in a coal pit, and all of them are made practically for any thickness of seam. All of them also are made to run on wheels resting upon rails, that are laid in front of the coal face, or on skids, which make their own floor. The skids were originally introduced by the makers of the chain machines, but the makers of disk and bar machines quickly followed suit.

A NEW FORM OF BAR MACHINE

A form of the bar machine that is somewhat different from the remainder of those on the market but which is really an older form of machine resuscitated, is that known as the Simplex. It is the Goolden machine, which was introduced some 20 years ago, into several of the English coalfields, with important modifications. All gearing has been suppressed. In the other bar machines, the bar receives motion from the armature shaft, or the crank shaft of the engine through a somewhat complicated arrangement of gearing which provides the necessary reduction of speed, and also the reciprocating motion, and the ability to work around obstacles mentioned above. In the Simplex machine, which is also noteworthy for the fact that it has been developed by colliery engineers, at the Walsall Wood colliery in Staffordshire, the bar is directly attached to the axle of the motor, the motor itself being fixed in the center of the machine.

The bar itself also is slightly different from that employed with the other bar machines, of which the Hurd is the type. In the Hurd, the Picquick, and similar machines, the bar is either conical or cylindrical, the smaller end of the bar, when tapered, being on the inner end of the cut, and the bar has a screw thread cut in it, the cutting picks being sometimes fixed in the bottom of the thread, and sometimes on the top of the thread.

The object of the groove is to act as an Archimedian screw to bring the dirt out. In the Simplex machine the bar is square, but tapered, the cutting picks being fixed on the square faces, and arranged to be quickly tapped in and tapped out.

DISK MACHINE STILL THE FAVORITE

In spite of all the improvements in the bar machine, and the advent of the chain machine, the disk machine is still leading. According to the Home Office Reports for 1905, the number of disk machines in use still exceeded those of the whole of the remaining types of machines together, but there are signs that the proportion is being reduced. The disk machine is still liked by a large number of mining engineers, on account of its greater strength, and its greater ability to deal with any class of work. On the other hand, its greater weight, in the case of the majority of disk machines, is against it, because of the time and labor taken in "fitting" after a cut. Some forms of disk machine, however, in particular the Diamond, are arranged to cut to and fro across the face, and therefore it is only a question of filling out the coal that has been brought down from the previous cut, and where as in many collieries, the coal is cut at night, and filled out during the following day, the disk machine working to and fro, answers very well.

It will be understood that the above remarks refer to "longwall" working, which is so largely employed in collieries in the United Kingdom. A great deal of good work is being done by heading machines, as mentioned below. Exceptions to the heavy weight of the disk machines, are the Gillott machines, the oldest disk machine in this country, practically the parent of disk machines, which weighs only from 15 cwt. to a ton, and the Jeffrey, an American machine, which weighs 30 cwt. The majority of the disk machines weigh 2 tons.

THE PUNCHER VS. DISK, BAR AND CHAIN MACHINES.

As mentioned above, the punching machine has received a new development in the last 7 years. The development commenced with a machine worked out in Germany, known there as the "Eisenbeis." It was brought over to the United Kingdom and known as the "Champion," and is now known as the "Siskol." It has been followed by several others, the "Radialax," made by the Ingersoll Rand Company, the "Little Hardy" made by the Hardy Patent Pick Company, and others. The essential feature of these machines is, the drill is held upon a vertical pillar, consisting usually of a tube,

arranged to be extended, or shortened, and fixed between blocks on the floor and the roof.

The connection between the body of the machine and the support, is practically a universal joint, and the drill is arranged to sweep over an arc, either in a horizontal, or vertical plane, or in any plane at any angle that may be desired. The method of working is, a drill of a certain length is placed in the machine, and is made to sweep out an arc, in the plane in which it is set, cutting a groove in the coal, or whatever the substance may be, to the depth the drill is capable of working. The drill is then removed, and a longer one placed in the machine, which cuts the groove deeper, and so on.

It will be seen that this arrangement allows of grooves to be cut in any position, and under practically any conditions. When the groove has been cut to the required depth in one position of the drill, the pillar is taken down, moved forward along the face, a fresh cut made, and by properly overlapping the arcs, a practically continuous cut is obtained. Some forms of this machine are not able to work in thin seams. It will be seen that while a considerable amount of work may be done with this form of apparatus, it has not the flexibility of the puncher on wheels. It does not represent so closely the man behind the pick. It has more of the limitations of the machine.

A later development of this arrangement, which has been adopted in the county of Durham, is, the machine is mounted on a carriage fixed horizontally, the machine standing horizontally, and cutting its arc from that position. The carriage has wheels which run on the usual mine rails.

The smaller types of these machines are useful to assist the disk machine.

For instance, in room work, where a disk machine is working across a fairly long room, something on the lines of the system adopted in America, the little punching machine is handy to cut a vertical "nick" after the undercut has been made, to assist in getting the coal down. The power taken by the puncher in its original form on wheels, with the runner spragging the wheels with a shoe on his boot, is practically the same for the same work, as that of the machine carried on the vertical pillar, or on the horizontal carriage.

There is the same variation in the power expended, with both of these machines, according to the substance in which cutting is being done, but both require from 70 to 100 cu.ft. of air per min. at 60 lb. pressure. The puncher machine, and in particular the one on wheels, has the advantage, which is being more realized as coal cutting is being more and more employed, that the coal undercut by it comes down better than

when undercut by any of the other three. The coal undercut by the tapered bar, also is found to come down better than that cut by the chain or disk. The working, as in other cases, depends upon the kind of coal that is cut, but there are complaints that with the ordinary parallel cut, and particularly with a small thickness of cut, the coal, where the joint with the roof is not strong, simply settles down upon the floor, when it is free to do so, in one mass, and has to be broken up by shot firing, before it can be filled out. On the other hand, with the cut made by the puncher, which can be arranged in any form the runner likes, and which is usually more or less of a V shape, or the section of a right-angled triangle, the coal is able to fall forward cleanly, just as when hand holed, and it breaks up much better with the parallel groove. With the V-groove made by the tapered bar, which may be as much as $7\frac{1}{2}$ in. at the front, against $3\frac{1}{2}$ in. at the back, the coal has again a better chance of breaking clear from the roof, and of breaking up. It is stated that a higher price has to be paid to fillers for filling out coal after parallel cuts, than after the cuts made by the puncher.

It should be mentioned that so far, all punching machines are worked by compressed air. No electric puncher has yet established itself, though there have been several tried.

[An electric coal puncher manufactured in this country at Syracuse, New York, is being satisfactorily used at a number of American mines.—EDITOR.]

CUTTING IN THE COAL IS TO BE FAVORED

A point also may be mentioned in connection with the question of cutting in the coal and cutting in the underlying fireclay. Cutting in the floor enables the whole of the coal to be obtained, but it is claimed by Mr. Mavor, a member of the firm who are makers of one form of the bar machine, that by cutting in the coal, a larger quantity is undercut in a given time, and for a given amount of power, and the quantity of coal got in the specified time is therefore larger, and though the quantity of small made is also greater, the final balance is in favor of cutting in the coal.

It may be mentioned, that in the controversy between the makers of bar machines and the manufacturers of disk machines, apparently bar-machine makers prefer to cut in softer material, while disk machine makers do not mind what the material is.

COST OF GETTING COAL

The cost of getting coal by the disk machine, which varies necessarily with the material cut in, and with the other conditions, ranges from 26c. per ton to

\$1.10, the latter being an exceptional price, 40 to 62c. being the general range. The saving with coal-cutting machines over hand labor, ranges from 2c. per ton up to 39c. per ton. In the majority of cases, the savings are from 8 to 16c. per ton. The question of compressed air and electricity is dealt with farther on, but it may be mentioned here, that there does not appear to be any great difference between the costs when driving by compressed air and by electricity, under similar conditions. Further, the costs as obtained by impartial observers, appear to show that the disk machine is still the one working at the smallest cost all told, though again, with the same conditions, there does not appear to be any great difference.

The question of the actual machine to be employed depends entirely, as in so many other engineering questions upon the whole of the conditions present. As explained above, where the work to be done is heavy, it is at least wiser to use a disk machine, notwithstanding the disadvantages mentioned, while where the holing is light, one of the other machines may be employed with advantage.

One important advantage that arises incidentally from the use of coal-cutting machines, is the increased output per man employed. In the United Kingdom, with the increasing output of coal, the number of skilled men available is becoming proportionately less, and therefore any increase in the output per man is of value, both from this cause, and also because it lessens the outlay that has so often to be undertaken in providing houses for the miners.

Collieries are usually located where houses are not easily obtainable. Most frequently what are practically new villages have to be built, to accommodate the men working at the colliery, and the outlay under this head is often a considerable item in the capital account. Coal owners and coal mining companies find it absolutely necessary to provide houses, and of an increasingly comfortable class, for the working miners, or they cannot get them to come to the colliery; hence, anything which reduces this item of outlay, is of importance.

DRIVING HEADINGS

In driving headings, the struggle is between the well known chain header, represented in this country principally by the Jeffrey, and the puncher represented by the Ingersoll-Rand machine on wheels, and the different forms that have been mentioned, in which the machine is carried on a vertical pillar or horizontal carriage. Apparently the chain header is holding its own, but the struggle is fairly keen, and in particular

a large number of the "Champion" or "Siskol" machine, as it is now called, are being employed for the work. The great portability of the machine is of enormous advantage in driving headings, and in all narrow work, such as the "bord-and-pillar" working, of which there is still a considerable amount going on in the United Kingdom.

COMPRESSED AIR VS. ELECTRICITY

In 1900, by far the largest number of coal-cutting machines in use in the United Kingdom, were driven by compressed air, the proportion between those driven by compressed air and by electricity, being nearly as 5 to 1. But with the development of the use of electricity that has been going on so rapidly since then, the number of electrically driven machines has been steadily increasing. The number of coal-cutting machines in use has increased from 316 in 1900, to 1133 in 1906, but the machines that have been brought into use since 1900, have been, a large number of them, electrically driven. In 1906 the proportion was 682 run by compressed air, and 451 by electricity. If the work the different machines are capable of doing is taken into consideration, the proportion would now be largely in favor of electricity, for among the machines run by compressed air, are a large number of the punchers of the "Champion" and similar types. Recently, however, there has been a revulsion on the part of colliery managers, against electric driving of coal-cutting machines, principally because of the greater danger to life. Electrical apparatus in mines, in the United Kingdom, has unfortunately taken a somewhat large toll of life, and the toll has been particularly heavy in electrically driven coal-cutting machines.

The following instance, which was the subject of an inquiry in Scotland, illustrates this point: The flexible cable connecting the gate-end switch box with the coal-cutting machine, was inclosed, in the neighborhood of the machine, in an india-rubber tube; the tube passed through the hole in the frame of the machine, through which the cable was carried, and formed the protection for the cable, against the cutting action of the metal in the hole. The rubber tube was cut or worn through, and in time the conductor became connected with the frame of the machine, and the man who was engaged in moving the haulage rope in front of the machine, received a shock, which killed him. Apart from the humanitarian question, it is certain that no colliery manager would allow the use of machines, unless a reasonable chance of safety to the attendants was assured; with the "Workman's Compensation Act" in force, the killing of a man makes

rather a serious charge upon the cost of getting the coal. A man's relatives may have as much as \$1500 awarded them as compensation for his death, and it will be seen that this makes a charge of about 12c. per ton upon 12,000 tons of coal. From the figures given in a previous portion of the article, for the saving in cost obtained by the use of coal-cutting machines, it is evident that something like one such accident a year would neutralize in many cases, the whole of the saving obtained by the use of the machine.

WHY ELECTRICITY IS FAVORED

The principal reason why electricity has been so largely introduced into mining work, for power purposes, and hence has been adopted for coal-cutting machines, is the greater efficiency of transmission. It is practically acknowledged that when air is compressed at the mine, an efficiency of only 25 per cent. or at most, 30 per cent. in transmission to the face, can be hoped for, while with electrical transmission, 50 per cent. can nearly always be relied upon, and 60 per cent. can often be obtained. But while this argument has an important bearing upon the question of the power used underground in a colliery as a whole, and particularly in the collieries of the United Kingdom, where the distance over which the mineral has to be hauled, and the quantities to be hauled, the water to be pumped, etc., are so steadily on the increase, the argument is by no means so sound, when applied to coal-cutting machines. Of the total cost of getting coal by means of coal-cutting machines, the cost of the power is not such an important item. I have before me, figures taken from actual work, with different types of machines, in different kinds of coal. The amount of energy expended per ton of coal obtained, ranges from 0.25 of a "Board of Trade" electrical unit, or kilowatt-hour, up to 1 kilowatt-hour. The cost of generating electricity at a colliery, is in the case of the latest modern installation, less than 1c. per unit, and in even small installations, not laid out so economically as those that have been mentioned, the cost per unit will not exceed 2c. In my opinion, 2c. per unit would be a high price.

Two-stage air-compressing machinery of the straight line type, driven by compound engines, is at least as efficient as electric generating machinery. It is a question whether it is not more efficient, if the question of the heat in the air is omitted. Hence, allowing that the efficiency of electrical transmission is twice that of compressed-air transmission, when the latter is compressed at the mine, the costs for power would range from $\frac{1}{2}$ c. per ton, up to 4c. per ton, the latter being

usually in cases where the total cost of getting the coal is high, owing to the general conditions. It will be seen at once, that the question of the saving in the cost of power, so far as coal cutting is concerned, is not really serious, and that as a question of economy, electricity does not prevent any great advantages over compressed air, in a great number of cases.

But there is another and very serious aspect of the question, and that is the difficulty that is so often experienced in maintaining the necessary power at the face, with compressed air. The efficiency of transmission by compressed air, as is well known, is largely reduced by leakage. The sides and roof of mines unfortunately work, and the joints in the compressed-air pipes are apt to be sprung, resulting in the leakage of the air, which is an important item. Further, in the case of coal-cutting machinery, the flexible hose which connects the air-pipe service with the coal-cutting machine, is liable to be damaged.

One colliery owner who had adopted an electrically driven coal-cutting machine, informed me that he was led to do so because when inspecting different coal-cutting machines at work, he had seen more than one in which the hose had been damaged, and the air was coming away freely at the face, instead of working the machine. This is one of the troubles that there should be no difficulty in overcoming, and I believe it has been overcome by the use of flexible metallic tubes; however, it illustrates forcibly the weak point of driving coal-cutting machinery by compressed air. Again and again in the reports of tests that have been made, the remark occurs, the pressure of the air at the machine was not greater than such and such a figure, and therefore the machine could not do its best work.

THE DIFFICULTY OF MAINTAINING PRESSURE AT FACE

The above applies quite forcibly to the case of the puncher machine. To perform its best work, whether on wheels or supported on a pillar, it requires a pressure at the machine, of not less than 60 lb. per sq.in., and it is difficult to maintain this pressure when the air is compressed at bank. It is necessary to compress to a very much higher pressure than is usual, and therefore the efficiency of the system is lowered, and notwithstanding the higher pressure at bank, it is still difficult, partly owing to the higher pressure, to maintain the necessary pressure at the face.

The development of electrical power in coal mines provides the solution of the problem. In Germany, a good many years ago, the system was introduced of plac-

ing the air compressor as near the working face as possible, and driving it by an electric motor, taking power from the electric service of the colliery. At first sight, as in so many other cases, it looks as if the arrangement could not be economical. The energy of the steam engine has to be converted to electrical energy, to be transmitted through cables, which take their toll, to be converted to mechanical energy in the motor, and then the compressor has to be driven.

A consideration of the whole theory of the working of compressed air in coal mines will show that notwithstanding the double conversion, the arrangement is economical, and practical experience confirms this. It is perfectly practicable to compress air, in the neighborhood of the coal face, to such a pressure that it can be delivered at the coal-cutting machine with practical certainty at 60 lb., and the coal-cutting machines are thereby enabled to do their best work. It will be remembered that apart from the leakage of air that has been mentioned, the great source of loss with transmission of power by compressed air is the fact that the heat which is liberated in the air during the act of compression, is obliged to be wasted. It would be lost in any case during the passage of the air from the surface to the coal face, and in practice it is found more efficient to as far as possible, carry off the heat from the air as it is liberated. The reason for this is, of course, that larger quantities of free air are taken in at each stroke of the piston, when the air is cooled and the compressor itself is cooled, than when both are allowed to heat and expand.

PREVENTING THE FREEZING OF THE MOISTURE

But with the conditions ruling at the face the problem is a different one. One of the troubles in connection with the running of compressed air engines at the face, it will be remembered, is the freezing of the moisture carried by the air, in the ports of the engine, and the consequent throttling of the air, resulting in reduced efficiency and reduced output of the engine employing it. This has been overcome by the improved arrangements that have been introduced during the last 15 years or so. Where the air is compressed in the neighborhood of the face, it has been suggested by makers of compressed-air machinery, notably by Mr. Reavell, who has developed the electrically driven portable air compressor, for use at the face, that the air need not be cooled; that it should be delivered to the engine that is to use it as nearly as possible at the temperature to which it is raised in compression. Mr. Reavell has succeeded, by insulating the pipe lead-

ing from the compressor to the motor engine, in delivering the air at such a temperature that the exhaust air from the engine is still hot, and there is no tendency whatever towards freezing, etc. Mr. Reavell suggests that the matter might be carried further than this. It is well known that with compressed air the lower the pressure the higher the efficiency, and he therefore suggests that the air shall be compressed to only 20 lb. or thereabouts, adiabatically, and delivered to the motor engine, with, as far as possible, all the heat present that has been delivered to it.

He further suggests that the motor engine might be arranged to work expansively, and that by employing a slightly higher pressure, say $22\frac{1}{2}$ lb. instead of 20 lb. per sq.in., and cutting off at 0.6 of the stroke, instead of 0.9, as usually arranged, a considerable economy in air and in power would result.

Mr. Reavell informed me that he has not yet had an opportunity of carrying out this plan, but he has succeeded in delivering the air hot to the motor engine, as explained. It appears to the writer that the matter may be carried still farther, and that the plan adopted by the Ingersoll-Rand Company for one of their drills might be adopted for coal-cutting machines with advantage, and the air kept continuously in circulation from the compressor to the motor engine and back to the compressor again. This would get rid of all possible troubles from moisture, such as might arise when the air of the mine from which the suction for the compressor was taken was muggy, as occurs at certain times of the year.

There should be no difficulty also in arranging to thermally insulate the pipes leading from the compressor to the coal-cutting machine, and back to the compressor. There are a number of substances on the market, that could easily be applied to the outside of metallic tubing, and that would maintain the temperature of the air, with very little loss between the compressor and the coal-cutting machine.

It should be possible also, with such an arrangement, if it is worth doing, for the sake of economy, to work the engines driving the coal-cutting machines more expansively. Obviously it would be to the advantage of the whole system to expand the air to as low a pressure as possible. The arrangement in fact would be a counterpart of that which is done with cold-storage compressed air apparatus.

Concerning the question of working the punching machines at lower pressures, if the suggestion to work at lower pressures is worth considering on the ground of

economy, there should be no difficulty in meeting. It would merely mean a small increase in the areas of the cylinders.

It should be mentioned also, that the compressed-air motors driving coal-cutting machines have also been very much improved during recent years. The motors employed for the early coal-cutting machines had one cylinder only, then two cylinders were employed, and two cylinders were the universal practice until very recently. Now four cylinders are employed, giving a much more even turning moment to the crank shaft, and providing a more efficient machine.

Quebec Mining Law

SPECIAL CORRESPONDENCE

Some important changes in the mining laws of Quebec province have been made by a bill introduced by Hon. Charles Devlin, Minister of Colonization, Mines and Fisheries, which was passed by the provincial legislature on May 8. It assimilates the law as regards prospecting and the acquisition of mining claims to that of Ontario. The former "prospecting license" is abolished, but the rights of present holders of prospecting licenses will be continued until Jan. 1, 1910. It will be replaced by the issue of miners' certificates, which can be obtained on payment of a fee of \$10, and confer the right to prospect on all lands, whether public or private, the mining rights on which are vested in the Crown. In case of discovery the prospector must erect a discovery post on the chief point and four corner posts inclosing his claim. In unsurveyed territory the area of a location cannot be less than 40 nor more than 200 acres, while in surveyed territory a license may be granted for one acre and upward to 200 acres, which is the limit in both cases. After staking, the Mines Department is to be notified at once, and within four months from the date inscribed on the posts application must be made for the issue of a mining license. The application must be accompanied by a fee of \$10 in addition to a sum equal to \$1 per acre of the location. The mining license is good for one year and can be renewed on payment of the same fee and acreage tax. The mine can be worked for any length of time on this license.

Mining land can be purchased, as before, at any time on payment of the price, \$10 per acre for superior minerals and \$2 for inferior minerals, if at a distance of 20 miles from a railway; and \$20 per acre for superior minerals and \$4 for inferior minerals, if situated less than 20 miles from a railway. All sales are on condition that *bona fide* working of the mine is to

commence within two years and the patent is to issue only after an expenditure of \$500 for each acre purchased has been made. Failing these conditions the sale may be set aside.

This act is intended to remove the great objection to the old law that tracts of mineral land could be purchased and held indefinitely by speculators who had no intention of working them. Its enactment has been urged for several years by J. Obalski, long head of the provincial Bureau of Mines.

Oil and Gypsum Locations in California

SPECIAL CORRESPONDENCE

There is some excitement at Watsonville, Santa Cruz county, Cal., over the discovery 12 miles distant, of an oil well yielding 250 bbl. daily and plenty of natural gas. Santa Barbara men are about to commence drilling for oil on 1700 acres of bonded land south of Red Bluff in Tehama county. This is far north of any point where oil has thus far been found in the State. Another item of interest in the oilfields is the discovery of auriferous sand at a depth of 300 ft. in the McKittrick oil district, Kern county.

Recently large areas of land in the known oil belts have been located for gypsum, though it has been an open secret that oil was what was wanted. An agent of the Land Office has been looking into this matter and where patents were about to issue to gypsum locators, they have been notified that receipts have been issued under a misapprehension of facts. They are also informed that the gypsum to be mined must have a commercial value, and in this value accessibility must be considered. If at a point remote from a railroad where the cost of mining and hauling would preclude the possibility of selling at a profit, its commercial value would be nullified. The miners do not take kindly to the Land Office determining both mining and commercial possibilities for them when passing on mining locations. The miners think they know more about this than the Land Office.

Consul Henry D. Baker reports that in the silver-lead mining district of Western Tasmania there was considerable embarrassment during 1908 on account of the closing of the smelter at Zeehan, owing to lack of profit in successfully treating complex ores, with low prices ruling for the products extracted. Owing to the distress occasioned by the closing of the smelter, the Government loaned the company money with which it could resume occupation.

A Volumetric Method for the Determination of Mercury

BY W. H. SEAMON*

The following method has been well tried out in my laboratory, first on salts of mercury mixed with varying amounts of the salts of such other substances as might interfere with, or influence, the reactions; and finally with ores of mercury carrying cinnabar with a lime, iron, silicious and clayey gangue. The method is based upon the formation of mercuric iodide when potassium iodide is added to feebly acid solutions of mercurial salts, the end reaction being determined by the formation of the characteristic blue color made by iodides in the presence of small amounts of nitrous acid in contact with starch paste.

SCHEME

Weigh out half a gram of the pulp and transfer to an Erlenmeyer flask of 125 c.c. capacity; add 5 c.c. of concentrated hydrochloric acid and allow it to act for 5 to 10 min. at a temperature of about 40 deg. C. Then add 3 c.c. of concentrated nitric acid and resume the gentle heat until all the cinnabar is decomposed, which will occur in a few minutes. Then add 3 c.c. of strong sulphuric acid to precipitate lead salts, if present, after which 5 c.c. of strong ammonia is added with care, drop by drop, followed with 25 c.c. of water. Filter, collecting the filtrate in a 150-c.c. beaker, washing the filter carefully twice and keeping the bulk of the filtrate as low as possible; then add 2 c.c. of strong nitric acid which has been discolored by exposure to strong light and cool to room temperature. The solution is then ready for titration.

STANDARDIZATION

The standardizing solution is made by dissolving 8.3 grams of potassium iodide in a liter of water. A solution of this strength will have a value of 0.005 gram of mercury to each cubic centimeter. It is standardized with solutions of mercuric chloride. The usual solution of starch paste, cooled to room temperature, is kept ready for use and small drops of it are placed on a color plate. The titration is made by setting aside one-third of the solution and running in the standard solution from a burette, withdrawing a drop of the solution from time to time, until a strong end reaction is obtained; then add the reserved portion and continue until a faint blue coloration is found. Deduct $\frac{1}{2}$ c.c. from the burette readings when the bulk of the liquid is over 50 c.c., unless the standardizing is done with varying amounts of mercuric chloride, corresponding to the percentages of mercury in the ore.

ACCURACY

In the trials I have made I have found the results on the same ore to check within one-tenth of 1 per cent. and have worked with ores carrying from 1 to 15 per cent. of metallic mercury. Working on weighed amounts of mercuric chloride, treating them as described above for ores, I have found the method accurate for weights of mercuric chloride ranging from 0.005 to 0.35 gram.

In titrating, the characteristic precipitate of mercuric chloride will not show under the conditions described unless there is about 4 per cent. mercury present and in some instances, when larger quantities of acids, etc., may have to be used, the precipitate may not show, even though there be 15 per cent. mercury present. Although the absence of a precipitate may be regarded as unsatisfactory, yet the accuracy of the method is not affected, for the double decomposition of the two salts goes on just the same and the end reaction will not show until the proper amount of iodide of potassium is added.

EFFECT OF FREE CHLORINE

The presence of free chlorine destroys the accuracy of the method, giving the end reaction on the addition of the first amount of iodide of potassium. To overcome this difficulty, free chlorine being generated by the mixture of the hydrochloric and nitric acids, was the occasion of much labor. Evaporation of the first solution on the water bath is the surest way of driving off the chlorine, as well as the excess of acids, and makes the method more accurate and the formation of the precipitate more certain at the time of titration; but this requires more time than is always convenient in a technical laboratory. Boiling the solution, before the addition of ammonia, was tried, using a larger amount of sulphuric than directed; also adding more water; but in all trials made it was found that enough chloride of mercury was volatilized to sensibly lower the results. It was finally found necessary to keep the amount of acids used in decomposition to as low a point as possible and to add the ammonia as described. The presence of ammoniacal salts hinders the formation of the precipitate of mercuric iodide; otherwise they have no effect.

DECOMPOSITION OF THE ORE

The decomposition of cinnabar is not easy and it is best to have the pulps as fine as 200 mesh, and the hydrochloric acid should be allowed to act for a few minutes alone before adding the nitric acid; failure to adhere to these instructions will cause a failure in solution.

The following method of decomposition gave satisfactory results, but was not adopted owing to the frequent breakage of the flasks: The weighed pulp was introduced into a pear-shaped flask of 200

c.c. capacity, to which was added 7 to 10 c.c. of concentrated sulphuric acid, $\frac{1}{2}$ gram of crystallized tartaric acid and 7 grams of acid sulphate of potassium. The flask was heated in a gas flame, or that from a Dangler lamp, until the solution became almost colorless; then 5 grams of potassium nitrate was added and heating continued until all, or nearly all, of the sulphuric acid was driven off. The flask and contents were allowed to cool and the mass dissolved in water, with the aid of heat, the solution filtered, 2 c.c. of brown nitric acid added, the solution cooled and then titrated. In the trials made and completed, the results were found to be good and the method more satisfactory than the one adopted. There were so many losses from breakage of the flasks that it was abandoned. No loss by volatilization occurred.

PRESENCE OF OTHER COMPOUNDS

Small amounts of nitrous acid are necessary to give the end reaction, setting free the iodine. I have found 2 c.c. of nitric acid, which had been exposed to the sun long enough to be discolored, sufficient. Soluble salts of lead are precipitated by potassium iodide, consequently they must be removed. If known to be absent the addition of sulphuric acid may, and should, be omitted. I added weighed amounts of lead nitrate to the pulps used and found that the method described eliminated all the lead far enough not to affect the results when as much as 0.2 gram of lead nitrate was employed. The soluble salts of silver are also precipitated by iodide of potassium. No special tests were made to determine if the hydrochloric acid employed eliminated it sufficiently to prevent interference.

One-tenth of a gram of a salt of iron, copper, antimony, arsenic and bismuth were added separately to a pulp and it was found that their presence did not change the results.

COMPARISON OF WET AND DRY METHOD AND CONCLUSIONS

Five different pulps were employed and the results obtained by the dry and iodide methods were as follows, the first figures being the percentage found by the dry method, and those in parentheses the percentages found by the iodide method: (1) 0.8, 1.1, 0.9 (1.2, 1.1, 1.2); (2) 3.5, 3.0, 3.4, 2.9 (3.6, 3.5); (3) 7.5, 8.1, 7.0 (8.3, 8.2, 8.4); (4) 10.5, 9.0, 10.3, 10.0 (11.7, 11.6, 11.6, 11.7); (5) 12.5, 11.2, 13.8 (15.1, 15.0, 14.9).

The method is quick and reliable. The treatment with sulphuric acid can usually be omitted, as lead is seldom found associated with mercurial ores, so far at least as my own experience may be relied upon. Care must be employed to use as little acid as possible to secure perfect decomposition, and to eliminate free chlorine and the presence of hypochlorites; in efforts to accomplish this do not

*Apatado 247, Chihuahua, Mex.

fail to remember that mercuric chloride is volatilized on boiling, freely, solutions of mercurial salts in the presence of free hydrochloric acid.

Efficiency in the Administration of the Public Lands of a Nation*

By A. C. VEATCH†

Van Dieman's Land was once chiefly remarkable as the site of a most notorious British convict settlement. Today this country, renamed Tasmania, furnishes a most inspiring record of efficient public service. Viewed from our own sad experience the record there is almost incredible and is both an incentive and a promise.

Gold was discovered in Tasmania in 1852 and the mineral wealth of the country began to be slowly developed. In 1871 the future of Tasmania as a great min-

eral deposits of importance have passed into the hands of private owners. So insignificant are the coal areas that the only coal mines in this territory which are now being worked are operated on Government lease. Indeed, the total mineral production of Tasmania today, and in 1905 it equaled that of Nevada, comes from Government leasehold. These results contrast very markedly with those obtained in the United States. Here, while the law of July 4, 1866, expressly forbids the alienation of mineral lands under the agricultural land laws, enormous areas of such lands have been acquired in this way.

So far did the Tasmanian officials deem it advisable to carry this policy of reservation from sale of lands known or supposed to contain minerals, that it became necessary to provide some form of surface holding within the mining areas. The Waste Lands Amendment Act of 1881, therefore, provided for the sale of lands in mining settlements subject to the right to mine on payment of damages. The act of 1885 gave to the holders of business and residence areas the right to purchase

development of the mineral wealth and resulting increase in the population and ordinary tax revenue of the State. There is no theoretical consideration that the State should control all things. There is only the practical consideration that certain things should be done because the best results can be attained in that way. Had leasehold proved unsatisfactory, or if freehold were shown to be the best way of promoting the attainment of the desired result, there is no question that the mineral lands would have been and would now be sold, but there is among mining men in Tasmania the same abiding feeling of satisfaction with the general principle of mineral leasehold that is found throughout Australia.

In response to the question, "What are the defects in the present law from the standpoint of the prospector and capitalist?" the Secretary for Mines replies: "No complaints from either prospectors or capitalists have been received; I presume they are satisfied." In answer to the question: "Does the policy of leasehold retard mineral development, as compared with

FIG. 1. POSITION OF JOPLIN ZINC BELT AT FOOT OF THE OZARK UPLIFT

ing region was assured, and a great vista of promise opened up by the discovery of the now famous Mt. Bischoff tin mine, which up to the close of 1906 had paid dividends to the amount of £2,083,000. Other discoveries followed, principal among which were the rich silver mines at Zeehan, discovered in 1882, and the famous Mt. Lyell copper-gold mine, found in 1886. This mine in the year 1904 paid dividends to the amount of £150,000; in 1905, £175,000; and in 1906, £420,000.

DISPOSAL OF MINERAL LANDS

All these mines were discovered at a time when there was absolutely no law forbidding the sale of mineral lands. Whether they were sold or leased was entirely a matter of executive discretion, and yet so faithfully have the land officials discharged the trust imposed on them that not only are all these important mineral properties still owned by the State, but except for small areas of coal lands, alienated in the early history of the colony.

the same after an expenditure of a certain sum on improvements, but in all cases with the reservation of the right to mine at a depth of not less than 50 ft. The act of 1889 went a step farther and declared all lands in mining areas open to selection but with the reservation of the right to search for gold and the right to mine at depths of not less than 50 ft. In 1891 the depth was reduced to 20 ft. and in 1900 the reservation included the right to search and mine for gold and other minerals. The Crown Lands Act of 1903 marks the natural conclusion of these several steps by providing that thereafter all grants should contain a reservation of the right to mine for all minerals at a depth of not less than 50 ft. on payment of damages. The Lands Act Amendment of 1905 waived all question of depth and provided for the reservation of all minerals in all grants.

LEASEHOLD VS. FREEHOLD

The Tasmanians regard the policy of government leasehold not as primarily a method of obtaining a direct revenue, but as the best way of securing the proper

freehold?" the Secretary replies with the unqualified monosyllable "No!" Lindsay Tulloch, a director of the Mount Lyell mine, the richest man in Tasmania, states most positively that he considers leasehold a better method of promoting development than freehold. Col. F. C. Hughes, vice-president of the Victorian Chamber of Mines, and a mining man interested in properties all over Australia, including several in Tasmania, states that the mining men of Australia with practical unanimity indorse leasehold as a better method of promoting mining development than freehold, and in his wide acquaintance among mining men, he knows of but one who seriously advocates freehold.

Tasmania thus affords not only a convincing indorsement of the practical success of government leasehold of minerals, but is an inspiring example of efficient public service. The record of the Lands Department of this State for over 50 years of important mineral development is one of which the country may well be proud, and shows that a patriotic and efficient administration of the land affairs of a State is not a human impossibility.

Migrations of the Joplin Zinc Belt

By CHARLES R. KEYES*

There is one quite remarkable feature concerning ore deposition in the Ozark mineral fields generally, and in the Joplin zinc belt in particular, that has never received the practical consideration that it deserves. It is not only important from a strictly mining standpoint, but from a purely geologic point of view it is of great interest. It is the constant shifting of position which the ore belt appears to have undergone since the present Ozark dome began to take shape and orebodies commenced to localize.

It is now pretty well understood that the present orebodies of the Ozark region are recent depositions, that they are now being formed about as rapidly as ever orebodies were in the past or as any ore deposits ever are, that they are not scattered about over the uplift promiscuously, but in accordance with definite geologic structures, and that they are confined in the main to a relatively narrow, but well defined, belt which is traceable without break for a distance of several hundreds of miles. The geologic reasons for this peculiar disposition of the orebodies are now not hard to find. Present evidences also go to show that the position of the ore belt has not always been the same as that which it occupies today, but that it formerly was much higher upon the back of the great dome.

The most noteworthy generalization regarding the geographic distribution of these ore deposits is that they are mainly restricted to a narrow band which completely encircles the broad dome at its very base. While this belt reaches practically unbroken around the entire dome, the unequal richness of the orebodies owing to local peculiarities of geologic structure, has given rise to the general impression that the ore deposits are accidentally located in a few comparatively small and indifferent areas. The impression is further strengthened by the fact that in consequence of the mining camps being segregated they have been considered as distinct mineral districts.

LATER GEOLOGIC HISTORY

The possible change of position of the ore belt is a theme which for a full explanation involves something of the later geologic history of the region. These episodes began immediately before the last upraising of the region into the present dome at the beginning of which period the Coal Measures probably extended nearly or quite over the center of the area. This covering was relatively thin, having been beveled off previously. As the present dome arose the thin layer

of soft shales was rapidly stripped off the hard sloping limestones beneath. A low Coal Measures escarpment, if it might be so called, everywhere faced the middle of the dome as it does today.

Considering specifically the Joplin ore belt, it was probably at one time located near the crest of the dome near Cedar Gap, but as the Coal Measures were constantly removed through general surface erosion it followed down in the pitching syncline the ever-retreating margin of the shales, which always acted as a barrier, or dam, to impound the vadose waters, or to raise the local groundwater-level. Doubtless many minor orebodies now existing between Cedar Gap and Joplin once belonged to the main ore belt at a time when it occupied that altitude, but being cut off from the parent body in some way or other remained intact without being weathered or carried away in solution to other and lower levels. The general relations of the ore belt to the geologic structure are best shown in Fig. 1.

FIG. 2. PROFILE OF GRAND FALLS CHERT HORIZON SHOWING OREBODIES IN BOTTOMS OF STRUCTURAL TROUGHS

The influence of the Coal Measures margin and the so-called cross-bars of Joplin upon the movement of the ore-belt down the slope of the dome is well shown in the Joplin district. For many years it has been noted that, in the vicinity of Joplin especially, the most notable inclinations of the rock-beds often strike in a northwest direction. Among the miners who are most familiar with the local conditions of the area it is agreed that the Ozark uplifting could have had no effect upon the geologic structure because the sharper bendings of the strata trend northwest instead of northeast. This idea is given greater prominence by the recent contour map of the Federal survey. While only a single prominent arch is here noted there are within the limits of the map no less than four such arches all parallel to one another. The towns of Galena, Joplin, Cartersville and Carthage lie on the eastern slopes of the several anticlines. There are other arches of the series. Significantly the main ore deposits also lie almost entirely on the east sides of the arches. With the great Joplin-Springfield syncline pitching westward and radially down the slope of the dome the minor cross-bars, or arches, act upon the general underground waters somewhat

as do dams placed at regular intervals in a stream. The vadose waters are partially impounded. A model of the structure would be not unlike a system of riffles in a gold-washing sluiceway.

Considered tectonically, the cross-bars were manifestly formed at a geologic period far removed from that during which the larger Joplin-Springfield syncline originated. The latter is thought to be associated with the system of foldings now more or less pronounced that make up the Boston mountains and the Ouachita mountains to the south and that were formed before the upraising of the present Ozark dome. The former belong to a wholly different system; they are themselves flexed longitudinally. The location of the orebodies with reference to the minor warpings of the strata in the Joplin district are indicated in Fig. 2.

According to a consular report from Hobart, by Consul Henry D. Baker, several new companies have recently been

organized for the purpose of treating the complex ores of the silver-lead district of Western Tasmania. One company has a patented process for the treatment of ore containing zinc, the object being the production of zinc oxide and the recovery of silver, lead and gold as a lead bullion, and of copper as a precipitate. Another company has just obtained a concession from Parliament for a 12-months' reserve of lands near the headwaters of the Derwent river, containing valuable water-power rights, where it is proposed, if found entirely feasible, to produce electric power at low cost for the operation of works where complex ores are treated.

Greece possesses many mines, writes Consul-General George Horton, of Athens; the chief minerals are those of iron, lead, zinc, silver, etc. The mines are found chiefly on the eastern shores of the peninsula and in the islands of Aegean. Notwithstanding this mineral wealth, the industrial development of the country has been slow on account of the lack of fuel, which is nowhere found in quantity. For this reason, most of the minerals are exported in a crude state after the simplest preparation.

*Consulting geologist, Des Moines, Iowa.

Gold Dredging in Russia

By I. I. ROGOVIN*

The Permanent Consulting Committee of the gold and platinum industries at St. Petersburg has recently published some data on dredging for gold in Russia during 1907. There were in all 64 dredges at work in that year, 25 in the Ural and 39 in Siberia, nearly all in the Yenissei Taiga. The latter, it may be remarked, work under conditions of climate, etc., quite similar to those found in Alaska and the Canadian Yukon.

In the districts studied the working season is limited by the weather, as it is impossible to operate a dredge in the winter. The average number of working days decreased from 173 in 1906 to 137.1 in 1907, with a consequent decrease in results. The following table shows the average per dredge—calculated on the whole number from which returns were received—the figures being reduced to American measures:

	1906.	1907.	Changes.
Working hours per dredge	2,837	2,259 D.	1 578
Gravel handled, cu. yd.	159,540	139,260 D.	20,720
Gravel handled per hour, cu. yd.	56.1	64.4 I.	8.3
Gold bullion recovered, oz.	1,082	1,140 I.	58

The increase of 15 per cent. in the average of gravel handled per hour is considered encouraging. It shows that the average capacity of the dredges is increasing. This is due to the fact that the newer dredges are heavier and more powerful, with larger buckets.

Some time ago the Permanent Committee appointed a special commission to determine the cost of running the average dredge during one season. After examination this commission put the working cost at 30,000 rubles—\$15,450—per dredge in the Ural, and 38,000 rubles—\$19,570—in the Yenissei Taiga; these sums not including cost of general management nor amortization.

It is calculated that 1 pood of the gold bullion recovered is worth about 18,000 rubles. This would make the bullion about 850 fine. One pood of crude platinum, 83 per cent., has the same value—which is equivalent to \$270 in United States money. Reducing the Russian figures to American weights and money, the committee considers that a dredge in the Ural district must recover at least 880 oz. gold bullion or crude platinum to meet the working expenses. In the Yenissei Taiga the amount required would be 1110 oz. gold bullion. These amounts, however, cover only actual working expenses; if there be added the cost of general management of the property and depreciation, or amortization of the original cost of the dredge—which items would approximate \$5150 yearly—it will be seen that the

average recovery in 1907, as given above, would be sufficient only to cover the cost in the Ural, while in the Yenissei there would be a deficit. To run a dredge for a season in the Ural without loss there must be a recovery of at least 1050 oz. gold or platinum in the Ural, and of 1300 oz. gold in the Siberian district.

Complete returns from 46 dredges show results as in the following table, the Russian measures being reduced to Troy ounces of gold won during the season:

	Dredges.
Between 2632 and 2895 oz. gold.	1
Between 2369 and 2632 oz. gold.	1
Between 2106 and 2368 oz. gold.	2
Between 1842 and 2106 oz. gold.	2
Between 1580 and 1842 oz. gold.	8
Between 1316 and 1580 oz. gold.	3
Between 1053 and 1316 oz. gold.	8
Between 790 and 1053 oz. gold.	6
Between 526 and 790 oz. gold.	10
Less than 526 oz.	7
Total number	46

No less than 23 of these dredges fell below the amount of gold estimated by the committee as necessary to pay the yearly operating expenses. That is, one-half of the dredges must have been run at an actual loss.

Electric Power for Wisconsin Zinc Mining District

SPECIAL CORRESPONDENCE

The Interstate Light and Power Company, with a capital of \$750,000 has just been incorporated, with headquarters at Galena, Ill., for the purpose of constructing a large electric power plant with a capacity of about 5000 kw., and of building about 26 miles of primary power lines and 16 miles of secondary lines, these to extend throughout Jo Daviess county, Ill., and La Fayette, Grant and Iowa counties, Wis. The main transmission line will extend from Galena, Ill. to Platteville, Wis., furnishing 24 hour-lighting service to these two cities and all of the intervening towns.

This new company has acquired all of the properties, franchises and power contracts of the Tri State Light and Power Company, of Galena, Ill., and the Platteville Electric Light and Power Company, of Platteville, Wis. A large number of the principal mining companies now operating throughout this district have already made arrangements to use this electric power for operating their mines and mills, thus reducing operating expenses and removing the difficulties of coal haulage, boiler repairs, etc.

The use of electric power is particularly of advantage to new properties, which by its use may avoid investment in power station, thus confining the investment in cash more directly to the actual operations of milling and of underground development. In well developed properties the great advantage in electric drive comes through the fact that as the property extends and more power is required, the

mere purchase of a motor is all that is necessary, even though this additional power is needed some distance from the mill. Electric power is the principal power used in all the great mining districts today and the Wisconsin district is to be congratulated upon the introduction of this highly economical element at this time for bringing out the undeveloped resources of the region.

The individuals interested in this project are men well known in this line of business, whose experience will insure its good management from the start. The designing engineers are H. M. Bylesby & Co., American Trust building, Chicago, Ill. The directors of the power company are as follows: A. O. Fox, Madison, Wis.; Fred Krog, Platteville, Wis.; Geo. B. Caldwell, Chicago, Ill.; M. S. Sickle, Platteville, Wis.; O. E. Osthoff, Chicago, Ill.; A. T. Rogers, Madison, Wis.; M. F. Fox, Madison, Wis.

Monel Metal Wire

In the JOURNAL of May 15, page 988, there appeared a short note concerning wire made from Monel metal. The Orford Copper Company informs us that, while the figures concerning the tensile strength, etc., of the wire are substantially correct, the statement that the sole right to make wire from the metal had been granted to the Driver-Harris Wire Company is entirely incorrect. No exclusive rights to manufacture wire from Monel metal have been granted to any concern.

Correction

In the article "Impressions of a New Ontario Camp—Gowganda," by H. E. West, in the JOURNAL of May 1, 1909, the expression—"Rocks of the Keewatin horizon," in the first paragraph on page 901 should read "Rocks of Keewatin age," and in the third column on this page, "The Gowganda section possesses" should read "The North Gowganda section possesses."

The following notes by Professor Neumann, on the electric iron-ore reduction furnace of the Elektrometall-Aktiebolaget Ludvika, at Domnarvafet, Sweden, appear in the *Electrochemical and Metallurgical Industry*, taken from *Stahl und Eisen*, Feb. 24, 1909. The furnace is of 1000-h.p., three-phase type, with carbon electrodes and with a shaft, similar in design to a blast furnace. The height of the shaft is 5.5 m. (18 ft.) The consumption of coke per 1000 kg. of pig iron produced has been reduced to 275 kg. Though the ore and coke used contained sulphur (0.55 per cent.) the sulphur content in the pig iron was only 0.005 per cent. The slag contained only 0.35 per cent. iron.

*Mining engineer, St. Petersburg, Russia

The Australian Oil Shale Industry

SPECIAL CORRESPONDENCE

The report of the Commonwealth Oil Corporation, Ltd., for the year ending June 30, 1908, has been issued. The company owns oil-shale deposits and coal mines in New South Wales. The oil shale is partly exported for gas-making purposes and is partly retorted on the spot. The report states that 15,000 tons of shale have been mined, of which two-thirds, being of high quality, was exported. The average yield of the entire thickness of the seam gave over 100 gal. of crude oil per ton, while the shale retorted locally contained about 70 gal. crude oil per ton. About 5000 tons of this second-class shale has been retorted at the works at Torbanc. As to the extent of the shale beds, it is stated a tunnel has been driven for nearly a mile in length along the bed, the average thickness being 4 ft. without break or fault and continuing all the way of exceptionally high quality, averaging over 100 gal. crude oil per ton.

The coal mine has been opened by two shafts sunk 200 ft. to the upper coal measures; upward of 4 working places have been opened out, giving a daily production of 800 tons. The coal is used for making coke and also supplies the needs of the railway, brickworks and other consumers. Early in this year 104 coke ovens are expected to be at work. For some months 44 ovens have been in operation producing an excellent coke for which there is a ready sale. A large amount of work has been carried out in connection with the construction of crude oil works and refineries in the Wolgan Valley. The first of the series of benches, each containing 64 retorts, is well advanced. The corporation has constructed a railway line from the Government railway at Newnes Junction to the mines and works in the Wolgan valley, a total distance of 32 miles. At the Torbanc works 32 new retorts have been working since August. The crude oil obtained was superior in quality to that produced by the old retorts. The crude oil has a pale olive green color with a specific gravity of 0.880 and is an excellent oil for refining. The Hartley Vale refinery is being extended, and it is expected that refined oils will shortly be placed on the market in addition to the candles and other products now being marketed.

The company hopes that the Federal Government will encourage the oil-shale industry in Australia by giving a bonus. This matter is now under consideration. The Melbourne correspondent of the *Financial Times* (Dec. 28, 1908) says that 2d. a gallon of crude oil is wanted by the Australian producers. The present consumption of petroleum in Australia is equal to 100,000,000 gal. of crude oil, which

would mean the mining of 2,000,000 tons of shale per annum. A duty of 1d. on imported oil would yield nearly £100,000 per annum, the Australian consumption being now about 20,000,000 gal. Experience has shown that 1d. duty will not increase the price of oil $\frac{1}{4}$ d. therefore 90 per cent. of any bounty, by which the Australian oil-shale industry can be established will be paid by the Standard Oil Trust, because nine-tenths of all the oils used in Australia come through that organization.

Lehigh Coal and Navigation Company

This company owns a large coal estate in the Lehigh section of the Pennsylvania anthracite field. It owns the Lehigh and the Delaware Division canals and several short railroads used in its coal operations. It owns the Lehigh & Susquehanna railroad, but does not operate it, leasing it to the Central Railroad Company, of New Jersey. It owns a large interest in the stock of the Lehigh & Hudson River railroad. The report for the year 1908 shows capital obligations including \$19,113,000 stock and \$19,188,083 in bonds.

The income account for the year, condensed, is as follows:

Net receipts from coal lands	\$1,613,298
Railroad earnings	110,473
Miscellaneous receipts	243,670
Rental Lehigh & Sus. R. R.	2,198,800
Total receipts	\$4,166,241
General expenses	130,805
Rentals paid	101,743
Taxes	288,483
Interest	885,124
Depreciation	300,000
Sinking fund, per ton coal mined	149,611
Loss on canals	38,305
Total charges	\$1,884,071
Surplus for the year	\$2,282,170

From the surplus dividends of 8 per cent. on the stock, amounting to \$1,457,648, were paid, leaving a balance of \$824,522. This, with \$110,073 from adjustment of accounts, was added to undivided profits, the total of which was \$4,294,163 at the close of the year. The net receipts from coal lands show an average of 46.6c. per ton of coal mined.

The earnings of the Lehigh & Susquehanna railroad, as reported by the lessee, were \$8,387,444, a decrease of \$999,935 from 1907. Of the earnings last year \$5,134,355 were from transportation of coal. The anthracite coal tonnage carried was 8,671,909 tons, a decrease of 85,407 tons from preceding year.

The Delaware Division canal was opened for business on April 6 and the Lehigh canal on April 18, closing on Dec. 4 and Dec. 9. During this period a total of 25,203 gross tons was moved, 200,846 tons of it being anthracite coal. The total tonnage during 1907 was 248,820 gross tons, of which 190,205 gross tons was anthracite coal. The operating revenue fell \$38,305 short of meeting operating ex-

penses, as compared with a shortage of \$33,011 during 1907. The increased deficit is principally due to unusually heavy charges for dredging and repairs.

The coal statement for the year is as follows, in long tons:

	1907.	1908.	Changes.
Mined by company	2,973,172	2,826,197	D. 146,975
Mined by tenants	269,564	290,448	I. 20,884
Total shipments	3,242,736	3,116,645	D. 126,091
Used at mines	353,845	1,347,733	D. 993,888
Total	3,596,581	3,464,378	D. 132,203

Of the shipments last year 124,416 tons were from lands of the Alliance Coal Company. The coal used at mines was 9.8 per cent. of the total in 1907, and 10 per cent. in 1908. A number of improvements were made during the year at collieries and breakers.

At the Lansford power plant the output during the year amounted to 3,870,105 kw.-hours, against 3,138,873 kw.-hours in 1907. The output of power is now so near the capacity of the plant that it will be necessary to make some additions during 1909 to provide the current which will be required for extending the underground haulage systems and for other mining purposes.

The chief improvement in progress is the Lausanne drainage tunnel of which the report says: "Good progress has been made in this tunnel. The face which was driven from daylight stood 5130 ft. from the portal at the close of the year, having been advanced 3067 ft. during 1908. While it is impossible to estimate the exact point at which the basin of the Buck Mountain vein will be encountered, the information available indicates that the remaining distance in rock will be between 1800 and 2000 ft. It must be remembered, however, that a very considerable portion of the drainage system will be within the Buck Mountain vein. A gangway is being driven eastward in this vein from the foot of No. 2 shaft, which will be a part of the system, and it is proposed to sink a slope about midway between the face of this gangway and the point where it is expected that the rock tunnel will encounter the Buck Mountain vein, with a view to making two additional points of attack, and thus hastening the time when this improvement will be available. The total distance in rock and coal yet to be driven before the pumps at No. 1 colliery can be abandoned is about 12,800 ft., and the time required probably $2\frac{1}{2}$ to 3 years."

The 1908 production of ammonia and ammonium sulphate in the United States, according to figures collected for THE MINERAL INDUSTRY, is estimated at 87,600 short tons, valued at \$5,247,240, against 89,000 short tons, valued at \$5,511,770 the previous year. These figures include the production of all forms of ammonia expressed in equivalent sulphate of ammonia.

Colliery Notes

The present welfare of the coal-mining industry will be better advanced by the enforcement of existing State laws rather than by the enactment of new measures further to restrict mining operations.

When used by untrained men, the present designs of rescue apparatus are neither more nor less than death traps. However, when such an apparatus is used by a skilful man accustomed to it, the machine is almost certain to minimize the danger of colliery disasters.

Recent investigations at 36 mines, by a committee of engineers, showed that machine work, as compared with hand labor, insured a saving in cost of from 12 to 15c. per ton; the itemized cost being, for hand labor, from 36c. to \$1.30, while that of machine labor averaged from 26c. to \$1.12, the cost varying according to the prevailing thickness and hardness of the seams, which were from 1 to 6 feet.

The effectiveness of machinery in coal mining is well illustrated by comparing the advances of the coal industry in Great Britain and in the United States. In the United States we employ 940,618 persons in our coal mines; in Great Britain, a total of 1,050,028 persons are employed in this same industry. It is, therefore, an interesting fact that with fewer men, we, in the United States, produce 60 per cent. more coal than our British cousins.

In the establishment of a proper system of ventilation, the engineer must always remember the law of diminishing returns, and not forget that with a given fan, when we double the amount of power used, the quantity of air circulating is only increased about 25 per cent. For this reason it is always best to install a fan that is properly proportioned for the work at hand. If more work is to be done, another fan should be installed rather than overload the first one.

At one of the larger mines in Illinois where Goodman machines are used, the machine runners each get $3\frac{1}{2}$ c. per ton for their work; at this mine, it is common occurrence for both miners and loaders to earn \$200 per month in wages. The average tons loaded per man is 15; the highest tonnage per man is 25; the lowest is 10. The percentage of screenings through a 2-in. round perforated shaker screen is never more than 30 per cent. of the output. It is said that this mine holds the State record for work done by mining machines; 200 tons of coal have been produced per single shift for each machine.

According to the most recent statistics, of the total number of mining machines in operation in America, 5011 are designated as of the pick or percussive type; 4144 of the chain-breast pattern, and 157 of the longwall-chain type. In Great Britain, in the year 1907, there were 802

longwall-disk machines, 222 of the bar type, 79 of the chain type, and 364 of the different percussive makes. The longwall-disk machines in Great Britain are generally operated by compressed air, and the chain and bar types by electricity. Chain-breast machines are as uncommon in Great Britain as the longwall-chain machines are in America.

Accidents due to absolute thoughtlessness on the part of miners continue to be recorded. A case of this sort recently occurred when a miner attempted to insert a charge in a hole that had blown out in a hard heading; the shot-firer in this instance failed to consider the high temperature that remains in a shot-hole after a blow-out shot occurs. In this case, there was sufficient temperature remaining in the hole to ignite the second charge, instantly killing the two men who were engaged on the work. At the inquest which followed, it was stated that even cold water had been splashed into the shot-hole before recharging, yet the second explosive was fired.

A fair knowledge of the geology of a coal seam is not only of great practical value to the superintendent and mine manager, but is also sure to be a valuable aid to the foreman and the miner himself. Every miner should carefully study the coal bed in which he works so that he will be able to recognize readily the cleavages of the coal, as well as its other physical peculiarities. Such a practical knowledge on the part of a miner, if applied in daily work, will not only enable a greater individual production, but will make visible many treacherous disturbances that occur in the strata, which will permit the miner to attend properly to his roof, or to handle water and gas that may be encountered. Geology can be applied at the face of a chamber underground, as well as in the engineer's office on the surface.

During recent years, several European countries have enacted laws limiting the working day to nine, and in some cases even eight hours. In this connection the great problem involved has been with regards to whether or not this plan of limiting the working day would result in an increase in production. An examination of the problem in Austria, where the law limits the day to nine hours, shows that this restriction of the hours of work has not increased the output of the miners; also that the daily wage is slightly higher for a lessened output. The most important result of such legislation in Austria was the enforced introduction of mechanical coal cutters and conveyers at the faces. The law is also said to be responsible for the migration of many good miners to Germany and America in order to earn the high wages which the local limitation has prevented them from obtaining.

An English investigator after a careful study of colliery rescue work, stated that although the various oxygen-breathing

apparatus have passed the experimental stage, they are far from having reached perfection. He says that the great difficulty attending rescue work is the act of maintaining apparatus at the mines in a constant state of efficiency, for serious risks are attached to the use of such machines when they are in an imperfect condition. In speaking of the value of such apparatus, he did not refer so much to rescue work after an explosion as to the use of such apparatus in overcoming underground fires. This authority stated further that not less than five sets of apparatus should be kept in readiness at each colliery, and that no party composed of less than five persons should be permitted to enter a mine for exploring purposes; his reason for suggesting that each rescue corps be composed of not less than five rescuers is to prevent any accident in case of a mishap to one or more of the men. He says: "The splitting of a party should never be permitted under any circumstances. Everyone who has had to deal with underground disasters has experienced the difficulty of restraining men, under the influence of excitement, from undertaking rushes from which they would shrink in calmer moments."

The time is fast approaching when the manufacture of briquets in the United States will become a profitable industry. There are thousands of tons of coal dust, of small commercial value, available in all of our important coalfields, and it is almost certain that this fine coal could be made more salable if manufactured into some patent fuel. The manufacturers of briquets in Wales are now doing a prosperous business, and the fuel manufactured in the Swansea district is being exported to France, Italy, Algeria, Egypt and other countries, besides the large quantities of briquets that are sold locally in the United Kingdom. These briquets manufactured in Wales retail at 2c. each, weigh about 9 lb., and form a useful and economical fuel for the poorer classes. The heat given out is equal to that of good steam coal. Before conversion, the coal dust is well washed to reduce to a minimum the content of shale, clay, or pyrites. Bituminous coal dust, dry-steam coal dust and anthracite coal dust are mixed in such proportion as to make the briquets burn with as little smoke as possible. The dust from coal containing about 12 per cent. volatile matter, forms the bulk of the material used in manufacturing these briquets. Smokeless briquets are principally made from anthracite coal dust and a smokeless cementing material. There are many places in America where coal is so cheap that briquets could not be profitably sold; however, this patent fuel is so compact and stands transportation so well, it is safe to say that in many places where the price of coal is high, such a fuel could be sold at a material profit to the manufacturer.

THE ENGINEERING AND MINING JOURNAL

Issued Weekly by the

Hill Publishing Company

JOHN A. HILL, Pres and Treas. ROBERT MCKEAN, Secy.
605 Pearl St., New York.

London Office: 6 Bouverie Street, London, E. C., Eng.
CABLE ADDRESS: "ENGINEERING, N. Y."

Subscription, payable in advance, \$5.00 a year of 52 numbers, including postage, in the United States, Mexico, Cuba, Porto Rico, Hawaii or the Philippines. \$6.50 in Canada.

To foreign Countries, including postage, \$8.00 or its equivalent, 33 shillings; 33 marks; or 40 francs.

Notice to discontinue should be written to the New York office in every instance.

Advertising copy should reach New York office by Thursday, a week before date of issue.

For sale by all newsdealers generally.

Entered at New York Post Office as mail matter of the second class.

CIRCULATION STATEMENT

During 1908 we printed and circulated 507,500 copies of THE ENGINEERING AND MINING JOURNAL.

Our circulation for April, 1909, was 43,000 copies.

May 1.....	12,000
May 8.....	10,000
May 15.....	10,000
May 22.....	10,000

None sent free regularly, no back numbers.

The Margin on Zinc Ore

After a highly prosperous time in 1906, extending up to the middle of 1907, when the zinc smelters enjoyed the advantage of a margin between spelter and ore much larger than the average, conditions began to go against them, the margin running down to nearly \$10 per ton in the second half of 1907. Throughout 1908 the margin was small, the minimum, on monthly averages, having been \$6.90 in January, while the maximum was \$11.74 in June. The average for the year was \$10.07. In computing the margin on zinc ore, we take the difference between the value of 1020 lb. of spelter at St. Louis and 2000 lb. of blende, containing 60 per cent. zinc at Joplin. The margin is, therefore, the amount out of which the smelter must pay for the carting and railway freight on the ore, the cost of smelting, freight on the spelter to St. Louis, selling expense, and some minor items. The aggregate of these costs is a good deal more than \$10 per ton of ore, wherefore, with a \$10 margin, every smelter in the United States is losing money on the face of things.

However, the adversity of a \$10 margin is ameliorated by several conditions. Some smelters by especially skilful work are able to recover a little more than 1020 lb. of spelter. (We are aware of claims of much higher extraction and some records appear to show it, but these are generally found to exceed the percentage computed on the basis of the input and output of a year). Some of the spelter product may be marketed, under favorable conditions, at a premium as "specials." Some smelters may secure an advantage by purchasing ores higher in iron than the average, obtainable at a profitable discount from the base price for standard ore. But all of these advantages fall short of enabling the smelter to come out even on a \$10 margin.

How then can the smelters afford to buy ore for so long a time upon so unprofitable a basis? The explanation is that the Joplin product is taken to a very large extent by the zinc smelters who also make sulphuric acid out of the ore. Consequently, in buying the ore at a nominal loss they are as a matter of fact paying more or less, perhaps fully, for the sulphur value of the ore, the sulphur value being approximately \$2.50 per ton of ore. These concerns are naturally a dominant element in the Joplin market. Joined with

them are those concerns which buy selected ores and make especially high-grade spelter that almost always commands a substantial premium. If the concerns that make a specialty of buying ore high in iron be added, there remains but little Joplin ore for the outsiders.

In 1907 and 1908 there were in the United States 18 zinc smelting companies that were in the market for Joplin ore. The major portion of the output of the Joplin district in 1907 was purchased by six companies, each of which obtained therefrom supplies of ore in excess of 23,000 tons. In 1908 the smelters received from the Joplin district 270,000 tons of ore, of which 212,500 tons, or about 80 per cent. of the total, was taken by seven concerns, three of which made sulphuric acid, their purchases alone running to nearly 90,000 tons. The conditions in the Wisconsin ore market are similar, practically the entire production of that field being absorbed by four concerns, all of which make sulphuric acid.

Consequently it happens that when the price for spelter is high, as it was in 1906-07, and the supply of ore from the Rocky Mountain States and Mexico is abundant, the less favorably situated smelters do not have to compete so strenuously in the Joplin market, and while the price for ore in the latter may be high the margin is apt to be favorable to the smelters. But when the price for spelter is low, and consequently the price for ore is low, the supply from Colorado, New Mexico and Mexico is diminished and the smelters are forced more to the Joplin district with the natural result of narrower margin. If the supply of ore be permanently diminished by a tariff on the Mexican and Canadian product the outlook will be for narrow margin all the time, which would indicate that some of the smelters might have to go out of business.

An amendment introduced by the Finance Committee of the Senate on May 18, making the duty on spelter 1½¢. per lb. and making zinc in ore dutiable upon a graduated scale, rising to 1¢. per lb. when the ore contains upward of 30 per cent. zinc, does not materially improve the prospect for the smelters. They do not import any ore with less than 30 per cent. zinc. The concession upon lower grades is simply to throw dust in the eyes of the ignorant. The addition of ½¢. per lb. to spelter will give the domestic industry just so much more protection against the im-

portation of foreign spelter. However, the smelters will remain in the uncomfortable position between the millstone of shortage of ore supply on the one hand and the competition of foreign spelter on the other hand. Even now spelter is from time to time imported under the drawback privilege, a practice that is certain to increase.

Mr. Lawson's New Process

Thomas W. Lawson's latest philanthropy to the public, which he wants to see get rich quick, loudly heralded in advance, turns out to be the offering of the stock of the Santa Rita Mining Company, and the "Process Copper Company." The mining company owns the old mines at Santa Rita, Grant county, New Mexico, which various persons have tried to work during their long and checkered career. According to John M. Sully they possess large deposits of low-grade ore. Mr. Lawson now thinks that he has found the key to success in a new hydrometallurgical process, invented by Charles S. Bradley, who is well known by the invention of some details that were of importance in the aluminum industry.

Mr. Lawson introduces his new scheme by publishing an octavo volume of xlviii+252 pages about it, in which italics and black-letter type of various sizes are profusely employed. Let not the reader expect, however, 300 pages of unalloyed pleasure, or anything like another "Story of Amalgamated," distributed gratis. In the present volume, pages 1 to 74 are occupied by a report by Mr. Sully on the Santa Rita mines. Pages 75 to 248 give the result of 8004 samples, which far outdoes old Homer's catalog of the ships, and would hold the record for aridity were it not for Vega's tables of logarithms. Alas, Mr. Lawson, that you should be uninteresting!

We have looked through these 300 pages with a microscope to discover something of the nature of the Bradley process, but although we used an instrument of 100 diameters magnifying power, we failed to find more than a trace, the latter a remark that the process is being applied on a practical scale within gunshot of New York. Mr. Lawson also in an "important amendment" on page xxxii disclaims all previous statements that the process will extract 100 per cent. of the copper of the ore, and conservatively remarks that he

means the recovery of "a very large proportion of the copper which remains in any ore after every other known process has extracted the copper up to its limit."

The Consolidation Coal Merger

A good deal has been said in the press during the past week about the formation of a "soft-coal trust," the moving cause being the announcement of the merger of the Fairmont and other coal companies in Pennsylvania and West Virginia with the old Consolidation Coal Company, of Maryland. As a matter of fact, the change brought about by the merger is only one of form. The Consolidation Coal Company was the first and the largest operator in the well known Cumberland or George's Creek basin on the Maryland side of the upper Potomac. It developed that field, which produced a coal of unusually high grade, and built the railroad which connected the mines with the Chesapeake & Ohio canal and the railroads at Cumberland. The field is one of the oldest producers in the country; it has been mined for the best part of a century, and the managers long ago foresaw its approaching exhaustion. To provide for this they acquired control of coal lands in the adjoining Fairmont field in West Virginia and in Somerset county in Pennsylvania. These lands were held by separate companies, but control of these was retained by the Consolidation Company. The merger, therefore, adds nothing to the actual holdings of the company, but will only simplify its management.

While there is nothing in the nature of a trust, it may be said the company owns one of the largest and best blocks of coal land in the country, its total extent being about 200,000 acres, and the underlying coal of the best quality. Its technical management has always been good, and its mines have been well and economically worked, as a rule. The company has had very few strikes in its history, and its miners have not been willing to leave it, largely because mining on the Big Vein of the Cumberland regions is much easier work than in the mines in the Pittsburg and other districts.

It may be noted that a controlling interest in the Consolidation Coal Company was for many years held by the Baltimore & Ohio Railroad Company. About the

time of the passage of the Hepburn law that company sold its stock to a group of Baltimore men, who were independent, but yet inclined to work with the railroad, in which also they were interested.

In our issue of May 1, 1909, in reporting the production of copper in North America and in the world, we made a mistake in giving the production of Canada in 1908 as 55,781,992 lb. That figure was indeed the aggregate of the figures reported by the smelters, but we neglected to deduct 2,056,779 lb. of copper in ore shipped to them from the United States. The failure to make this deduction, of course, caused a duplication in the statistics for the United States and Canada. The correct figure for Canada in 1908 is 53,725,213 lb. Carrying forward this correction to the statistics for the world, and also making a change in the statistics for Russia for which we have later received the official figure, the production of copper in the world in 1908 was 760,773 metric tons against 722,655 in 1907.

The iron and steel trades do not seem to be suffering very severely from the "open market," from which some operators—and some of our contemporaries—predicted such dire results would follow. The current reports of production show that mills which were operating to 50 per cent. of their capacity and even less, are now running up to 75 and 80 per cent., and even full in some cases. Eighty per cent. is a pretty good return for a capacity which has, in most cases, been adjusted to boom times. Moreover, a number of the larger companies which reduced wages in April have announced that they will return to the old schedules on July 1; this action being voluntary on their part, with no hint of strikes. All of which seems to show that the open market has its advantages.

Henry H. Rogers died May 19. His record as president of the Amalgamated Copper Company has often been commented on in the JOURNAL; it is sufficient to say here that he made of it one of the great industrial enterprises of the country. His latest work was the construction of the Virginian railway, intended especially to promote the coal trade of West Virginia.

Tungsten Industry of Boulder County, Colorado, in 1908

By R. D. GEORGE*

The financial stress which developed in the latter part of 1907 paralyzed the tungsten-mining industry, and for several months the camp was very quiet. Several of the larger Colorado producers in Boulder county closed down completely, a number of the smaller companies went out of business, and consolidations still further reduced the number of producers. It was not until the latter half of 1908 that the camp began to come to itself again. Since that time activity has increased, and the present year promises a large measure of prosperity.

One of the notable events of the year was the organization of the Primos Mining Company, which bought the tungsten

Philipp Bauer company and the Wolf Tongue company. Probably 75 small producers contributed to the total output largely, however, as a result of the development work undertaken. Most of their ore was treated at the Wolf Tongue mill at Nederland. A number of good finds were made in the southern part of the district, particularly near Manchester lake. High-grade ore in promising quantities has been opened up in the Boulder Falls part of the district, and this area is likely to make a good record when mining activity is fully restored. Some development has been done in the vicinity of Ward, not far from Gold lake, but no shipments have been made.

In the matter of concentration, some progress has been made. The Cardinal mill was improved by the addition of a large area of stationary canvas. The Clarasdorf mill built by the Philipp Bauer company uses a jaw crusher and rolls in-

Mexico's New Mining Code

SPECIAL CORRESPONDENCE

The new mining code for Mexico is up for discussion in the Chamber of Deputies and the proceedings of the legislative branches on this matter are watched with much interest. The failure of Congress to enact the law at the December session, after it had been referred by the President and the cabinet, with the so-called anti-foreign clauses eliminated, created a feeling that some strong influences were at work which might be able to revive the objectionable clauses for discussion and possibly enact them into a law. This impression was given color from the fact that the code, or law, was a measure, which, by special act of Congress, in accord with other similar cases, the President could, at his option, decree, enforce or refer to Congress for approval. It is likely that the reference of the law to Congress was because of its great importance and its broad scope.

The delay, however, lent color to the belief that the advocates of the anti-foreign clause would, at least, make an attempt to overrule the expressed policy of the executive.

The preliminary discussion on the law was related to the fundamental question of federal and states rights. The new law increases federal jurisdiction in matters relating to mining and it is on this that argument is made against the law. The ordinances of Philip II, in 1584, made the central government supreme in matters relating to mining. The famous "Ordinances of Mining," promulgated in 1784 reasserted the principle of crown ownership of minerals and the right of control by the crown. These remained in force, with some modifications, after independence. In 1857 a new constitution for the Republic was adopted which specifically left the states free to enact their own laws in regard to mining, and did not recognize the power or right of the general government as was established from the time of the ordinances of 1784. Only two states, Durango and Hidalgo, took advantage of this and enacted special codes. In 1883 the federal constitution was amended conferring on the general government exclusive power to legislate upon mining matters and in 1884 a new mining code was adopted which superseded all other laws, state and federal. This remained in force until 1892 when it was superseded by the present code. Both the laws of 1885 and of 1892 recognized the full federal control of mining but they did not go so far as to jurisdiction in regard to legal questions as does the new code now under discussion. The question has other bearings also and is likely to be fully discussed by the deputies.

mines of the Cardinal company, and those of the Stein & Boericke company. C. F. Lake, formerly manager of the Cardinal company, is the manager of the new company. The Philipp Bauer company, which held a lease on the Rogers group of about 2000 acres in the tungsten district, gave up the lease and retired from the field. Eugene Stevens, formerly manager for the Philipp Bauer company, now holds the lease, and has already commenced the vigorous development of some of the mines.

The Cardinal company kept a force of men on development work, and has opened up in the Conger, one of the largest, if not the largest, body of tungsten ore yet found in Boulder county. Promising finds have been made in other mines formerly belonging to this company, but now held by the Primos Mining Company.

The principal producers for the year were: The Primos Mining Company, the

stead of stamps. The problem of concentration is still a difficult one owing to the character of the ores. Ferberite is an extremely friable mineral and under the stamps slimes badly. Much of the gangue is hornstone and silicified country rock which are by no means friable. Again, a portion of the ore is in the form of minute grains of ferberite in a hornstone matrix. This needs very fine crushing in order to make anything like a satisfactory saving. The millmen of the district are alive, and are undoubtedly nearing a solution of the problem.

As to the future of the district, the producing area is today larger than ever and the deepest workings show no falling off either in quantity or quality of ore. With satisfactory prices for the product, the camp would show an increased production. The production for 1908 was as follows: Ore mined and concentrated, 3450 tons; high-grade ore ranging above 25 per cent. of tungstic oxide, 180 tons; concentrates, 407 tons; total value, \$167,257.

*Director, State Geological Survey of Colorado.

Manganese Deposits of Virginia

By S. MAYS BALL*

The manganese deposits of Virginia have for years afforded the principal domestic supply of high-grade manganese ores. The deposits, however, are pockety and are higher in silica and phosphorus than the Brazilian ores, but are suitable for many purposes. Deposits of manganese ore, according to the reports submitted to Commissioner G. W. Koiner, include high-grade oxides and manganiferous iron ores, and occur widely distributed throughout the State, particularly along the James river valley, and the Shenandoah, or Valley of Virginia.

At the Crimora mine, which is one of the most important deposits, a synclinal basin in the Potsdam sandstone approximately 900 ft. long by 500 ft. wide, has been filled with the clay derived from the decomposition of the ferruginous shales overlying the massive sandstone. The manganese, originally disseminated through the rock, has now become concentrated in the clay resulting from its decomposition. The ore, which is psilomelane with a little pyrolusite, is found irregularly distributed through the clay in nodular masses varying from pebble size to lumps a ton or more in weight. These deposits have been developed by means of a shaft with levels driven at 75 and 105 ft. The maximum thickness of the Crimora ore-bearing clay is apparently about 300 ft. The ore is crushed, washed and screened to remove fines, and after drying is ready for shipment. The lump ore has been mostly sent to England and the fines to Pittsburg. This mine has produced up to 50 tons per day of the highest grade ore, the composition of which is shown by the following analysis, made by Prof. A. S. McCreath; Mn, 57.201; Fe, 0.373; P, 0.075 per cent.

At other points in the James river valley and the Valley of Virginia, deposits have been opened and developed to some extent. Near Norwood, on the James river, and about two miles from Midway Mills, a deposit of high-grade manganese was opened some years ago and about 500 tons of ore of excellent quality was mined and shipped. This mine, however, was shut down on account of insufficient equipment to handle the water. The ore produced contained about 58 per cent. manganese, 1.5 per cent. iron and about 0.15 per cent. phosphorus. In the same locality, near Warminster, another deposit was opened and yielded a considerable quantity of ore similar in character to that mined at Norwood. Farther up the river, in the vicinity of Mount Athos, a deposit of good quality was mined to some extent.

At several other places on the southwest continuation of the Middle James river iron belt through Campbell and Pitts-

vania counties, deposits of promise have been opened. One of the most recent openings near Hurt Station in Pittsylvania county has indications of a considerable deposit of high-grade ore. From the large number of surface samples received by the commissioner there seems to be numerous deposits along this iron belt that are worthy of investigation. A few miles southeast from Mount Athos at Concord in Appomattox county, several openings have been made and some good ore exposed. From those openings analyses of two samples show a manganese content of 66.6 and 52.9 per cent., respectively. Deposits are also reported in the vicinity of Willis mountain, Buckingham county, and near Spiers mountain, but only surface samples have been obtained from those localities. Undeveloped but prospected deposits have also been reported from Albemarle and Orange counties.

In the northern portion of the Valley of Virginia the manganese production has been chiefly in the form of manganiferous iron ore, though deposits of high-grade ore have been opened at a few points. In Page county, manganiferous iron ore has been mined about three miles east of Milne's station and a promising deposit of high-grade ore, apparently of considerable extent, was found on the Garrison tract about two miles east of the railroad. The following two analyses by Prof. A. S. McCreath show the character of the ore: Fine ore, Mn, 52.691 per cent.; Fe, 2.325; P, 0.324; SiO₂, 2.795; lump ore, Mn, 53.656 per cent.; Fe, 1.537; P, 0.327; SiO₂, 1.955. In Rockingham county manganiferous iron ore of quality suitable for the manufacture of spiegeleisen has been opened on Big Run creek.

In Augusta county the clays derived from the Potsdam sandstone have yielded manganese ores at several places north and southwest of Crimora. North of Crimora a deposit was opened at Grottoes yielding ore carrying 48.7 per cent. manganese, with a silica content of 6.08 per cent. and 0.40 per cent. phosphorus. A few miles northeast of Elkton an opening was made from which samples of high-grade ore were taken. Near Sherando a number of years ago several hundred tons of high-grade ore were taken out of open cuts, the results pointing to the existence of a large amount of ore in this locality. At Lyndhurst station deposits are also reported and a few miles southwest of Lyndhurst the Kennedy mines produced a considerable amount of 43-per cent. ore. Cutting southwest at Vesuvius, in Rockbridge county, there is a deposit of rich manganese ore and at Midvale in the same county, another deposit exists from which good ore was obtained.

In Botetourt county a highly manganiferous iron ore has been extensively mined and shipped from the Houston mines, near Houston station. In places the bed contains pure manganese ore. The fol-

lowing analyses by Prof. A. S. McCreath show the composition of the manganiferous iron ore: Mn, 24.7 per cent.; Fe, 24.1; P, 0.138; SiO₂, 7.7. In other parts of this county prospecting has been carried on and more or less ore taken out at different places. In Roanoke county prospecting was done some years ago, a few miles southeast of Roanoke, and some high-grade ore was found.

Occurrences of manganese and manganiferous iron ore are reported from the southwestern counties of the State. In Lick and Draper mountains, Wythe county, Flat Top mountain near the Bland county line and in the mountains in the western part of Bland county, surface work has been carried on and some promising ore exposed. In Smyth county, near Marion, the Stalie's Creek Manganese Iron Company has opened a bed of high-grade psilomelane which it is developing. Many other surface samples received from the southwestern portion of the State indicate the occurrence of manganese deposits over a large area, the extent and economic value of which can be determined only by further development.

The Montana Mining Company

SPECIAL CORRESPONDENCE

The report of the Montana Mining Company for the year ended Dec. 31, 1908, states that there was a loss for the year on revenue account of £4582. Legal expenses, incurred prior to the existing lawsuit, amounted to £1776. At Marysville, Montana, the injunction on the compromise ground put a stop to operations and the only revenue derived was that obtained from shipping ore recovered by leasers and from the clean-up of the mill. There was an expenditure of \$20,416 on shaft sinking on the Compromise ground and of \$2513 in connection with pending litigation.

At the Lucky Girl group of mines at Edgemont, Nevada, 4531 ft. of development work was done on the Lucky Boy or Upper Vein, and 1136 ft. in driving the Deep Tunnel. The output from Jan. 1 to Nov. 30, when the mine was temporarily shut down, was 10,800 tons of ore from which bullion to the value of \$127,857 was realized, being an average of \$6.46 per ton. The working expenses amounted to \$102,872 or an average of \$5.19 per ton. The operating profit was reduced to a deficit by charges for fire insurance and prospecting expenditure in the upper levels of the mine.

The Nevada property was worked for eleven months. In November the stopes suddenly and simultaneously became impoverished, and could not be worked at a profit. It was decided, therefore, to shut down pending completion of the tunnel and installation of electric power, when

*Atlanta, Ga.

the low-grade ore exposed in the upper levels of the mine can be more economically and expeditiously handled than it is possible to do at present.

As regards litigation, the St. Louis Mining and Milling Company applied to the Federal Court for the State of Montana for an injunction on the Compromise ground, which was granted on Jan. 27, 1908, thus bringing work there to a full stop. Against this injunction the Montana company appealed to the Circuit Court of Appeals at San Francisco, the result of which was to affirm the action of the lower court; the consequence being that the company was tied up as it was last year. The suit is set for trial on June 14 of the present year.

Electric Hoisting and Pumping in the Cripple Creek District

By S. A. WORCESTER*

The fact is gradually becoming appreciated by mining operators in this district that electric power is now being furnished for the various operations of mining and milling, at rates that are lower than are made elsewhere in the State, and so low that, except for temporary plants, steam power cannot approach the electric plant in economy. My experience with induction motors, using current from central stations, for mining purposes in various mining districts, has inclined me strongly toward this convenient and economical form of power. While small electric hoists have come quite largely into use in this district, they have seldom, if at any time exceeded 30 h.p. in size, and no balanced electric hoisting has yet been done in the district.

A FIFTY-H.P. ELECTRIC HOIST

A 50-h.p. electric hoist, using a skip and overbalance weight, also an automatic side-dump waste car, designed by me, is now about ready for operation at the intermediate shaft of the drainage tunnel. An interesting feature of this plant is the weight; this consists of a steel water tank partly filled with water. As soon as connection has been made from the intermediate shaft to the tunnel portal, this tank will be filled with water, when the skip is at the tunnel level, so as to overbalance the loaded skip, which is then hoisted, the speed being regulated by the hoist brake. When the load has been hoisted and dumped, the tank, being then at the bottom or tunnel level, is automatically emptied, the water passing out through the tunnel. The empty skip then overbalances the tank and is lowered, using the brake as before. A stream of water which flows near the shaft will thus be made to furnish power for the hoist.

The tank will be filled and emptied automatically. The electric side-dump car, operated by the engineer from his station at the hoist, saves one man's wages per shift and is an inexpensive arrangement. It is provided with a safety switch, so that if the engineer fails to stop it at the end of its outgoing trip, no damage will result, and the car will dump itself and return without attention.

SAVING IN POWER COST

The saving in cost of power by using electric current instead of steam, will approximate 50 per cent. for this plant. The estimated saving per day for a 100-h.p. overbalanced electric hoisting plant, which I designed several months ago, over a modern steam-hoisting plant, was \$14 in two 8-hour shifts. The overbalanced hoisting system, now used by several mines in this and several other States, has great advantages over any other system, as applied to the majority of our metal mines in the Rockies. Four ore-handling plants on this system are now in operation in this State, the largest being the 5½-ton electric skip-hoisting plant of the Liberty Bell mine, at Telluride. This mine has the largest skip in use in the State, with a tail rope and tension carriage, and an overbalance weight of 14,000 pounds.

A few figures will show clearly the saving effected by overbalanced hoisting, as compared with unbalanced hoisting. Assuming an ore load of 2000 lb., and a skip weighing 1500 lb., to be hoisted a distance of 1000 ft., using ¾-inch steel rope, the total starting load is 4390 lb., and the average load during the hoist is 3945 lb. By using an overbalance weight of 2500 lb. the total starting load is reduced to 1890 lb., and the average to 1000 lb., or one-half of the load of ore, power being used in both directions. The necessary size of motor or engine will be in the ratio of 4.39 for the unbalanced plant, to 1.89 for the overbalanced hoist, or 2.32 to 1, and the power consumption will be as 4390 to 2000, or 2.2 to 1. If, as in the case of the Liberty Bell plant, a tail rope with tension sheave is used, the unbalanced rope load at starting is eliminated and the starting load becomes 1000 lb., the uniform load from beginning to end of hoist. The ratio of the size of motor or engine to that for the unbalanced hoist then becomes as 1 to 4.39, an immense difference, and the efficiency of the motor is much better, owing to the uniform load. Friction, which should not exceed 10 per cent. with any arrangement, has been ignored in these figures. If a steam hoist is used, a very small boiler capacity, relatively, is needed for the overbalanced plant, because of the much smaller and more frequent demand for steam. In a recent design of an electric-hoisting plant it was found that with the unbalanced arrangement the power company refused to furnish current for the large motor required, unless a rotary converter or equiv-

alent device were installed, in order to reduce the immense drop in line voltage which would result from starting so large a motor at full load. By using the overbalanced tail-rope system the size of motor was reduced so as not to be objectionable and the cost of the electrical equipment became about one-third of that of hoisting unbalanced.

The great majority of mine shafts in Colorado have but one hoisting compartment, and the expense of enlarging these shafts, or sinking new ones, in order to use two compartments for balanced skips or cages is in most cases prohibitive. By simply lengthening the skip, or using a long or deep skip, as is done at the Findley and Liberty Bell mines, in this State, and the Original and Stewart mines, in Butte, it is possible and highly economical to hoist an immense tonnage through a single-compartment shaft.

PUMPING

Estimates recently made for two of the larger mines of this district show that their pumping can be done by electric power at a cost of about one-half that of the present cost of pumping by steam. The simple expedient of attaching a substantial crank and gear-driving movement to the plungers of the present steam pump, eliminates the expense of a complete new pumping plant. The cost of additional equipment for electric pumping in these cases will be saved in three to five months of continuous operation. Owing to the fact that pumping gives a uniform 24-hour load, the power companies make a lower rate for this service than any other. In some cases it is possible, by allowing a large sump to fill during working hours, to do the major portion of the pumping during hours when the power company is underloaded, in which case the rates will be made extremely low, on account of the desirable character of the load. It is now very generally known throughout the district, that for continuous operation, lasting for a considerable period of time, even the most economical steam plants cannot compete with electric power in economy.

The Clark Copper Company

Inasmuch as it was announced in the personal column of the JOURNAL (a statement that the JOURNAL was fully justified in making) that I had assumed the management of the Promontorio mines in Mexico for the Clark Copper Company, I beg to state that I am no longer connected with that company in any way, and I disclaim any responsibility whatsoever for any of its projects, either mining or milling, now in hand, or to be undertaken.

PERCY E. BARBOUR.

Los Angeles Cal., May, 7, 1909.

*Mechanical engineer, Victor, Colo.

Personals

Mining and metallurgical engineers are invited to keep THE ENGINEERING AND MINING JOURNAL informed of their movements and appointments.

Rowland Cox, of New York, is in Monterrey, Nuevo Leon, Mexico.

A. G. Larson, superintendent of the Le Roi mine at Roseland, B. C., was in Utah recently.

H. M. Montelius, of New York, has been examining property in Clear Creek county, Colorado.

S. J. Speak, of Hooper & Speak, left London on May 1, for West Africa, on professional business.

Rodolphe L. Agassiz has returned to Boston after an extended visit to the Lake Superior district.

Walter Ragland, formerly a mine inspector of the State of Missouri, is mining at Neck City, near Joplin.

J. Morgan Clements, mining geologist, has returned to New York from a professional trip to Cananea, Mexico.

Thomas G. S. Hersey, an English mining man, who is largely interested in Gowganda properties, is in Toronto.

Sir Robert Perks, of London, is in Ottawa in connection with the construction of the projected Georgian Bay Canal.

Lt.-Col. H. Alexander Judd, who has been examining mines in New Mexico for London capitalists, has returned to England.

Fred McL. Strout, of Denver, has taken the management of the Protective Gold Mining Company, near Central City, Colorado.

George H. Hall, secretary of the Cleveland Rock Drill Company, Cleveland, O., has been in New York, on business for the company.

John O'Dea, manager of the Geneva Extension Mining Company, of Georgetown, Colo., has returned from a business visit to Fort Worth, Texas.

R. Randolph Bruce, formerly manager of the Paradise mine in Windermere district, East Kootenay, has returned to Wilmer, B. C., from a trip to Scotland.

Capt. Hiram Griswold, formerly manager of the Union Copper Mines, of Gold Hill, N. C., has taken charge of the Blue Wing Copper Mine at Virgilina, Virginia.

Louis Janin, Jr., well known as a mining engineer, and formerly on the staff of the JOURNAL, has recovered from a long illness, and is now in San Francisco.

S. E. Bretherton, of San Francisco, is spending a few days in Shasta county, Cal., on business for the Friday-Lowdon Copper Company whose property joins the Mammoth mines.

Alexander E. Outerbridge, Jr., has returned to Philadelphia from Jamaica, where he made an examination of the

work in progress on a copper claim which is now being explored.

Henry P. Lowe, of Denver, who is managing director of the Frontenac Mines Syndicate, Ltd., operating in Gilpin county, Colo., has left for London, England, on a mining business trip.

W. W. Leach, of the Geological Survey of Canada, was in Victoria, B. C., recently, on his way north, to resume his geological work in the Skeena river district of British Columbia.

Ernest Stenger, formerly with the Denver & Rio Grande Western railroad, has been appointed general traffic manager for the Utah Copper and the Ray Consolidated Mining companies, with office at Salt Lake City.

H. Irving Jones, who has been manager of the Aztec Mines Company at Central City, Colo., for the last two years, has accepted the position of superintendent for the Sunnyside Mines Company at Eureka near Silverton, Colo., and has assumed his duties.

Dwight T. Randall, late engineer-in-charge of fuel tests, Technologic Branch, United States Geological Survey, has associated himself with the Arthur D. Little Laboratory of Engineering Chemistry, of Boston, in charge of the Department of Fuel Engineering.

Sir W. Thomas Lewis having been unavoidably prevented from accepting the presidency of the Iron and Steel Institute, to which he was elected at the recent annual meeting, the council has requested Sir Hugh Bell, the retiring president, to serve for another year, and he has consented to do so.

Thomas Kiddie, of Northport, Wash., manager of Le Roi Mining Company's smelter, has been appointed representative of the Nicola Valley Coal and Coke Company on a board of conciliation and investigation under the Canadian law to deal with a labor dispute between the company and its men employed at the 'Middlesboro' colliery.

Obituary

Walter Dusenbury, a mining engineer, was accidentally killed by a train on the West Shore railroad at Bogota, N. J., May 12.

Robert S. Brown died at Easton, Penn., May 16, aged 61 years. He was for many years a prominent slate operator and quarman in the Bangor district in Pennsylvania, and had been president of the American Slate Company since its organization.

Ambrose H. Douglas died at the Leonessa mine, Matagalpa, Nicaragua, on May 1. He was well known at Silver Peak, Tonopah and other Nevada camps as a miner of ability and a man of upright life. He went to Central America from Nevada not long ago.

John Strang died at Salt Lake City, Utah, May 9, aged 39 years. He was born in Clackmannan, Scotland, and came to this country with his parents in 1878 and settled in Ogden. When a lad he engaged in mining with his father at Almy, Wyo., and later went to Scofield, where he became an employee of the Utah Fuel Company. He worked in the mines at Scofield and Winter Quarters and also at Castle Gate, where he assisted in opening up that vein of coal under the superintendence of W. G. Sharp. About 1892 he turned his attention to metal mines. He supplemented his practical experience with a close study of the theory of mining. He followed mining in Eureka, Utah. About eight years ago he was placed in charge of the Tetro mine and since remained at that mine as foreman and as superintendent.

Societies and Technical Schools

Montreal Technical School—The contract for the erection of the new Montreal Technical School building has been awarded to Peter Lyall & Sons, of Montreal, for \$387,000. The architect is J. S. Archibald and the building will be erected on Sherbrooke street, between Mance and Church streets.

Canadian Mining Institute—Secretary H. Mortimer Lamb has received the following letter from Hugh F. Marriott, of London, England: "Mr. W. Frecheville, Mr. R. E. Commans and myself, as members of the Institution of Mining and Metallurgy, having a lively recollection of the friendly feeling engendered and the delightful hospitality experienced at the hands of the members of your society, wish to farther express our appreciation in a small way, which we hope will be acceptable to your council. We offer a prize of \$250 for the best paper written for your society, to be decided by your council during the year 1909, on mining and metallurgical subjects within the Dominion of Canada, describing the advancement made in the branch selected, in the 12 months following the conclusion of our recent excursion. Competition to be limited to the younger members of the various grades of the society, say, under 30 years of age. These are the outlines on which we consider the prize will give a stimulus to your younger members, both to show their ability and to produce a paper of particular interest to those of your friends who will recall their experiences on the visit."

The gift has been accepted by the council of the Institute and a special committee—consisting of Professor J. Bonsall Porter, H. E. T. Haultain and J. C. Gwillim—has been appointed to see that the conditions are properly carried out. Papers must be in the hands of the secretary before Jan. 1, 1910.

Special Correspondence from Mining Centers

News of the Industry Reported by Special Representatives at San Francisco, Butte, Denver, Indianapolis, Salt Lake City, Mexico, London, Paris

REVIEWS OF IMPORTANT EVENTS

San Francisco

May 12—At the recent meeting of mineowners in San Francisco, to consider the eight-hour law, it was resolved, as stated last week, to count as working hours only the time actually spent "at the face." As further indicating the sentiment on this particular question of interpretation to be given the law pending the trial of a test case, a number of mine owners and operators suggested the following interpretation of the provisions of the law.

1. That eight hours' work shall be done at the face underground, the men going to and from their work on their own time.

2. That the time shall count from the time they commence work at the face, or their working place underground, and extend until they quit work at their working place.

3. That neither the law itself nor these foregoing provisions apply to men working on the surface, except those actually employed in reduction works.

4. That all employees, both on the surface and underground, shall be paid by the hour for time actually at work.

In making these suggestions the committee of mineowners desired that all the acts of the operators, managers and mineowners, during the pendency of the test litigation, should be fair and should be aimed at a conservative construction of the law, so as to avoid misunderstandings with employees and to avoid disagreeable features of arrest and court proceedings throughout out the State.

It is generally believed, nevertheless, that the interpretation as suggested by the operators in Tuolumne and Calaveras counties, should be generally accepted by the owners and operators throughout the State, so as to observe uniformity. The law will be fully observed in the event that it is declared constitutional and it is suggested to the various owners, operators, superintendents, etc., to inform their employees that the law is being tested with a desire to determine its validity, and of course, if valid, it will be upheld. Pending this determination by the courts, however, the employees have been asked to join with the operators in a fair temporary interpretation so as to avoid unnecessary disputes and court proceedings. This request has not been uniformly complied with as many of the miners relied upon their local unions to take up their side of the question and compel immediate

compliance with the law on the part of the operators. The mineowners of the State are now collecting funds to test the case and are collecting them on the basis of 50 cents per man employed.

The eight-hour law for underground miners and men employed in mills, smelters and other reduction works, which went into effect May 9, has already commenced to start trouble between mining companies and their employees. At the Sierra Buttes mine, Sierra City, the men were getting \$2.25 per day and board and this was reduced to \$2 per day and board, whereupon the miners quit work and the plant has closed down. At the Penn Chemical Works, Campo Seco, Calaveras county, the company has ordered that the men go to their work on their own time instead of owners' time, and the entire eight hours must be spent in actual work. It is expected that this copper property will also close down. At the mines of the Standard Consolidated Mining Company, Bodie, Mono county, where they pay \$4 per day for 10 hours work—the highest wages in the State—the miners threaten to strike if wages are cut down when the eight-hour schedule is in force by law. A number of other instances of similar nature might be cited, and within the next few days there will be hundreds of other cases of strikes in the mines and mills.

The 7000-ft. Spring Garden tunnel of the Western Pacific Railway company, near Quincy, Plumas county, has been completed, benches and all. The Chilcoat tunnel, 6400 ft. long, in the same county will be finished this month. Though in the midst of a mineral section where there are numbers of quartz mines, not a sign of mineral was discovered in either of these railroad tunnels, much to the disappointment of the mining men of that region.

The Associated Oil Company of this State has voted to issue bonds to the amount of \$25,000,000. Of this sum \$6,000,000 will be expended immediately in constructing a pipe-line from Coalinga, Fresno county to San Francisco bay, and another from McKittrick, Kern county across the mountains to Gaviota on the Santa Barbara county coast line.

Butte

May 13—J. Herbert Anderson, president of the Panhandle Smelting Company, was acquitted, at a preliminary hearing, of the charge of embezzlement preferred against

him by John Mocine, receiver of the company, and it is probable that the case will go no further. The charge was that Anderson had drawn a check for \$1750 on the funds of the company with which to pay a personal debt. A suit asking that a receiver be appointed for the Amador Consolidated Mining and Development Company has been instituted in the local district court as Missoula by 750 stockholders representing about \$80,000 shares of the company's stock. The complaint alleges mismanagement of the company's affairs for a long period of time, and it is stated that the officers and directors of the company are not acting in the best interests of the stockholders.

The purchase of the Pittsmtont company's property having been ratified at a special meeting of stockholders of the East Butte company held this week, the latter company now intends to issue 60,000 shares of its treasury stock for the purpose of forming a working capital. The stock will be issued to stockholders on the basis of one new share for four of the old. J. H. Reid, of Pittsburg, one of the largest stockholders in the Pittsburg company, will become a director of the East Butte company. Three hundred thousand shares of East Butte stock will be used to acquire the securities of the Pittsmtont company, now held by the banks of Pittsburg. The United States Fidelity and Guaranty Company has instituted action against the Reins Copper Company for the sum of \$1250, and Morely & Thomas, Butte real estate dealers, have instituted suit against the same company for the sum of \$637.37. The company's Ella and Combination quartz claims also have been attached.

The State Board of Railway Commissioners will hold a hearing some time this month at Helena to consider the question of establishing a connection between the Chicago, Milwaukee & Puget Sound and the Billings & Northern railways at some point in Fergus county. The roads parallel and cross each other, but have no connecting point and it is for the purpose of suiting the convenience of shippers by making some connection that the hearing will be held. The application of certain stockholders for the appointment of a receiver for the Kimberly-Montana Gold Mining Company was recently denied, the court holding that, since the Federal court had under consideration a petition that the company be adjudged a bankrupt, the State court was without jurisdiction to appoint a receiver.

Denver

May 15—The Doctor-Jack Pot Mining Company, in the Cripple Creek district, will pay a dividend on June 1 of \$14,000. The company has \$65,000 in the treasury and the property is now being operated by 15 sets of leasers. The total production of this property to date is about \$2,840,000. The shaft, now 700 ft. deep, is to be equipped with a new electric hoist and compressor. The Gaylord cyanide mill at the Jerry Johnson mine, on Ironclad Hill, is now running on the low-grade ores from that mine. It is expected to treat 50 tons daily. The El Paso Consolidated Gold Mining Company, which is credited with a gross production of \$423,000 last year, has now granted 31 leases, and is also operating a portion of its territory on company account. About 150 miners are now employed, and this number will be increased. The El Paso mine will be the first to be reached by the deep drainage tunnel. An important strike, proving the continuity of rich ore with depth, is reported in the American Eagle, of the Stratton Estate, at a depth of 1500 ft. from the surface, this being the deepest shaft in the district.

One of the big mining enterprises in Clear Creek county of which little is said in the press is that of the Waldorf Consolidated Mining Company, which owns 600 acres of mineral ground and has over 40,000 ft. of underground workings. The mines are developed by a crosscut tunnel 6000 ft. in length, intersecting the fissure veins of Mount McClelland, and exposing by drifts and raises ore of an estimated gross value of \$5,000,000. Two concentration plants at the mine have a capacity of 100 tons per diem and additional concentrating machinery has been ordered. Owing to the low price of metals, no production was made last year, and the work was confined to creating reserves of ore, but heavy shipments are to be made this year. The company owns its own railway, the Argentine Central, connecting with the Clear Creek branch of the Colorado & Southern, and by this route the concentrates are shipped to the Denver smelter. The character of the ore in the upper levels is silver-lead, which at depth in some instances has changed to auriferous copper and iron pyrites.

Leadville has been watching with much interest the action of the senate in regard to the tariff on lead. Several of the properties in this district are low grade and the fact that the tariff has been allowed to remain will enable mining men to carry on operations profitably.

Indianapolis

May 17—State mine inspector Epperson has taken steps to bring all mines in the State, no matter what their size, under the mine laws. At present the laws apply only to mines employing ten or more men, and the smaller mines are allowed to op-

erate as their owners please. There are over 400 small or wagon mines in the State, operating anywhere from one to nine men, and some even as high as 15 men, in violation of the law.

Mr. Epperson's plan is to bring all these mines under the State law and he is hopeful of being able to convince the legislature that it is necessary. The regular State inspectors would look after the large mines as at present, and 17 men, appointed in counties where there are wagon mines, would be paid by their own counties. Mr. Epperson says the loss of life in small mines is greater than in large ones and the application of law to them is very necessary.

The Indiana Supreme Court, in the case of Pugh vs. Collins Coal Company has decided that when the information that timbers are needed in a coal mine was actually given by the workmen to the company operating the mine, its failure to supply and deliver to such workmen the needed timbers constitutes a violation of the duty imposed by law on such operator, without regard to the manner or form in which the notice is given.

Salt Lake City

May 13—Last month the big concentrating mill of the Boston Consolidated at Garfield was running at two-thirds capacity, and it is expected that this month it will handle 3000 tons of ore daily, its maximum capacity. The mine workings have been extended to a more or less leached and oxidized surface zone to provide ore that is more amenable to concentration. During April, 10 units of the mill were working and the other two will be put into commission this month.

John D. Ryan, president of the International Smelting and Refining Company, which is building a large smelting plant in Tooele county, visited the smelter site last week. In an interview in Salt Lake City he said: "The smelter will be built as rapidly as possible with an initial capacity of 2000 tons per day. It will be so constructed that the capacity can easily be increased. It will be operated on the usual competitive lines of a customs plant, and when we are able to secure a sufficient volume of ore the character of which is not adapted to the smelter as its original unit is being planned, and which can be treated at a reasonable profit, the works will be added to or altered and adapted to the needs of the case." The latter portion of the remarks quoted is generally understood as indicating the possibility of the International company entering the lead smelting field whenever conditions seem to warrant this step. During his visit Mr. Ryan was for several hours in conference with Jesse Knight, and it was expected that something definite would be released concerning the talked-of deal for the Tintic smelter, the Colorado and Iron Blossom mines. Nothing was announced, how-

ever, and the impression is that the matter will receive further consideration before an understanding of any character is reached.

The Murray plant of the American Smelting and Refining Company has resumed operation after a brief shutdown owing to the walkout of the foreign laborers, who were later followed by the American employees. Last week the American workmen decided to return to work. On May 17, one furnace was started and it is expected that the plant will be in normal operation by the end of the current week. Some of the foreign laborers are being reemployed, but at the same schedule of wages as before the strike.

A plan for the reorganization of Newhouse Mines and Smelters is under consideration, which will result in the holders of the \$1,300,000 bonds agreeing to accept for them income bonds convertible into 260,000 shares of new stock at \$5 per share, while the holders of the present 600,000 shares of outstanding stock will pay an assessment of \$1 per share. Such an arrangement would enable the company to pay off its floating debt and leave upward of \$300,000 in the treasury.

Authority has been asked of the courts to re-open the U. S. copper smelter under the system introduced successfully in the lead smelter for restraining the smoke and neutralizing the sulphuric fumes. However, it is expected to be a matter of eight months or so before smelting can be resumed in any event.

Mexico

May 12—The action of a recent popular convention in declaring for the reelection of President Diaz and Vice-President Corral has cleared the political atmosphere and given reassurance to all business interests, particularly those in which foreign capital is invested. The broad and liberal policy of the president toward foreign investments has been fully evidenced in the past and it is well known that he has experienced no change of policy in this respect. The election will take place in 1910 for a term of six years. Should the president die during that term he will be succeeded, under the constitution, by the vice-president, who presumably now will be Sr. Corral. Business men, generally, feel full confidence in Sr. Corral's ability, progressiveness, and his liberal attitude toward foreign interests. He was formerly governor of Sonora, and has extensive mining interests there. He has been in close touch with the operations of Americans in the republic, and has always shown encouragement to the Americans in their Mexican undertakings. It is known that he joined with the president in the suppression of the anti-foreign, so-called, clauses in the new mining law.

While the low price of silver has held back a good many development enterprises

in Mexico, yet it is probable that the number of tons of silver-bearing ore produced is as great now as ever before, and that the output in ounces for the current year will show an increase over any previous year. Some of the companies find reasonable profit even at the present prices. Others treating low-grade ore, on which operations were installed on the basis of 60c. silver have seen their profits practically wiped out by the fall in the price. They have continued operations and have made desperate attempts to introduce the utmost economy in operation and treatment, and have been successful in reducing costs materially, in many cases much below the engineer's estimates. Most of the companies have been forced to practice unexpected economies in connection with the management and general expense charge. While the percentage of saving with the cyanide plants, which treat a large part of the Mexican silver ore has steadily increased over the first years of operation, it has not generally reached or exceeded the expectations of the engineers or managers. The Mexican silver mines generally carry very little gold, from 5 to 10 gm. of gold to 1 kilo of silver. The little gold with the Mexican silver has proved to be a safety factor during the period of low silver and it is carefully considered now. Formerly, with the patio process, it was largely lost. The production of silver and gold in connection with the copper operations in the Republic is steadily increasing, and promises to become an important factor.

London

May 8—The statutory meeting of the Abbotiakoona Mines, Ltd., a reconstruction of the Abbotiakoona (Wassau) mines and of the Abbotiakoona Block 1, Ltd., West Africa, was held recently. Under the amalgamation scheme the debentures and loans of the Block 1 Company have been paid off. The total number of shares issued to date is 903,876, of a nominal value of 10s. each, and there are 423,654 shares under all. The authorized capital of the company is £700,000 divided into 1,400,000 shares of 10s. each. The ore reserves on April 30 are estimated at 117,000 tons, averaging 13 dwt., over a width of 50 in. With the fresh capital raised by the amalgamation it is proposed to carry on vigorous development work and some alterations are also to be made to the plant. The directors are considering the advisability of shutting down the mill until the ore reserves are increased, anticipating a reduction in costs when working on a larger scale. Having regard to the smallness of the ore reserves and to the large capital that is invested, it is evident that the management has a hard struggle before them to earn fair dividends for the shareholders.

The latest process for the concentration of ores is that known as the Murex mag-

netic process, the advertisement of which had led to hostile criticism from another company interested in the same line of business, the Ore Concentration Company, owning the Elmore patents. An infringement of patents having been suggested, the Murex company wrote to the Ore Concentration company, saying that it was ready to exhibit its process to a committee of independent experts and to accept their decision whether the new process was an infringement of previous patents or not, each side to put up £1000 to cover expenses. This challenge the Ore Concentration company has so far not accepted. As to the merits of the new process the writer is not yet in a position to express an opinion, and the following information is extracted from an official circular. The Murex magnetic process is a wet process. The mineral particles in an ore are separated out by being made magnetic through the addition of a small percentage of magnetite. The process may be divided into two parts. First, the separation of mineral from gangue, and secondly, the separation of mixed minerals from each other. The ore, after being crushed, is treated with a "magnetic solution," mixed with a small quantity of water and then passed over a single magnet. In the second process the concentrates are again treated with a Murex solution and then passed over ordinary concentrating appliances, whereby the different minerals are separated from one another. All this sounds mysterious, and engineers will want more detailed information as to the nature and properties of the solutions used before accepting the process. In the circular referred to, the assay results, certified by a well known assayer, of the products obtained from a test on a low-grade Broken Hill ore are given, but as the weights are not published, the figures have little value. The Murex magnetic company has erected an experimental plant in London and invites engineers to make their own tests, an invitation which will in no doubt lead to fuller information being shortly published as to its value and novelty.

The Carmen Mines, of El Oro, is a new company starting business with an issue of £120,000 in £1 shares. The company owns claims to the north of the Sirio and El Sucedo blocks of the Esperanza, Ltd., at El Oro, Mexico. Development work is to be started from the Carmen shaft, which is to be sunk an additional 300 or 400 ft., "to get through the poor zone and into the level of the sulphide ore, which has been found so rich in the neighboring mines." Perhaps the company may meet with success, but the prospectors fail to make it clear that the Esperanza claims, under which it is going to work, are the poor portion of the property where development work has not so far proved anything of much value. The Esperanza mine proper is a considerable distance away.

Paris

May 12—The Compagnie Française des Gisements Aurifères du Comoré et Affluents sent a 3½-cu-ft. open-connected bucket dredge to Ivory Coast at the end of 1908 to work the deposits it owns on the Comoré river. The pontoon is 82x30 ft. and 6 ft. deep. It is made of timber as well as the gantries. The ladder is designed to dredge at a depth of 24 ft., when inclined at 45 deg. It turns concentrically with the upper tumbler shaft. The revolving screen is about 20 ft. long and 5 ft. in diameter. Gold is to be saved over eight Turner gold-saving tables fitted with coconut matting and expanded metal. Stones are rejected by a Robins belt elevator. The dredge is steam driven and equipped with a Babcock & Wilcox boiler of the portable type, having a heating surface of 750 sq.ft. The company reports that, notwithstanding difficulties, transport is proceeding regularly and that it expects that all the material will soon be on the spot ready for erection.

The Société des Forges et Acieries de Commeny-Fourchambault has just concluded an arrangement with the Campagnac collieries in order to increase its coal reserves. Its iron-ores reserves are insured by its interest in the Joudreville mine (Briey district), by the Muret mine bought from the Acieries de France and by iron ores in the Pyrénées which form a part of its smelting charges.

The Compagnie du Boléo, at the general meeting held in Paris on April 28 declared a dividend of 150 fr. per share of 500 fr. and of 87,714 fr. per one hundredth part, as against 200 fr. and 124,67 fr. last year; 312.50 fr., 1907, and 212.228 fr. 1906. The production of copper was 12,470 tons in 1908 against 11,150 in 1907 and 11,000 in 1906. The average tenor of the ore was 3.68 per cent. copper against 3.46 in 1907. The profit was \$938,640 against \$1,273,429 in 1907. The company has spent some \$400,000 in new installations, a third of which was for the harbor. The new furnace fitted with 24 tuyères is giving complete satisfaction and still better results are expected with the 30-tuyère furnaces.

The Société Nouvelle des Minas de la Lucette, the plant of which was lately described briefly in the JOURNAL, has declared a dividend of 40 fr. per share of 100 fr. against 35 fr. in 1907 and 30 fr. in 1906. Profits were \$323,592. Sales of antimony ore, regulus and oxide were \$273,000 against \$525,800 in 1907; and \$523,000 worth of gold and concentrates, against \$210,000 in 1907 and \$62,600 in 1906. The difference in value of antimony products is due almost entirely to the considerable diminution of the price of antimony since 1907. However, the working costs of this enterprise were covered to the extent of 80 per cent. by the sale of the antimony products.

Mining News from All Parts of the World

New Enterprises, Installations of New Machinery, Development of Mines and Transfers of Property Reported by Special Correspondents

THE CURRENT HISTORY OF MINING

Alaska

CHICAGOFF ISLAND

Golden Gate—A tramway and stamp mill are being installed. The machinery has already been shipped from Seattle. A 300-h.p. hydroelectric plant will also be installed by this and the Chicagoff Gold Mining and Milling Company, to be used in common.

Chicagoff Gold—In the main tunnel, 800 ft. long, a rich body of ore was recently opened. It is said that enough ore has been shipped to more than pay for driving the tunnel.

KASAAN BAY

Mt. Andrew—Regular shipments of ore are being made to the Tacoma smelter.

SEWARD

James Dinsmore and Nels Peterson will soon arrive with a large consignment of placer mining machinery.

Alaska Central Railway—A new board of directors was elected in Seattle last week. A contract for 30 miles of road was let to Snow & Watson.

Arizona

GILA COUNTY

Old Dominion—The April production of copper was 2,845,000 pounds.

Arizona Commercial—The Eureka shaft has been unwatered, and work will begin at once on the 600- and 700-ft. levels. The pumps handle 1,500,000 gal. water daily.

Arizona-Michigan—Copper ore was recently encountered at a depth of 325 feet.

Warrior Copper—During the month of April the company shipped to the Old Dominion smelter at Globe, Arizona, 1000 tons of copper ore. Eighty per cent. of this ore was from development work, and the average copper returns were 11 per cent.

GRAHAM COUNTY

Arizona Copper—The copper production for April was 2,686,000 pounds.

YAVAPAI COUNTY

Arizona Power—The tower line is completed into Jerome, and the work of stringing the copper wire is now going on. The wire camp is now within three miles of this city. Power will be ready to deliver over this line by June 1. The United Verde Copper Company will be a heavy consumer of power.

Grand Island—The work of unwatering the shaft is now completed, and work has been resumed after a short interruption caused by the installation of the new steam hoisting plant.

California

AMADOR COUNTY

Garibaldi Hydraulic—Coarse 'gold is being taken in good quantities from the sluices before the general cleanup is made. Bedrock has not yet been reached.

INYO COUNTY

Greenwater Copper—A 60-ft. ledge of 5 per cent. copper is reported as being recently crosscut on the 1000-ft. level. The sinking of the shaft is still being carried on to the 1500-ft. level, from whence the same ledge will be cut.

KERN COUNTY

Kern River Mining and Power Company—H. C. Shippee, manager and secretary, states that a large mill is to be erected near Havilah. The mine is on the Kern river near the plant of the Kern River Power Company.

Zenda—McCarthy & Johnson are preparing to reopen the Zenda mine at Amalie.

SHASTA COUNTY

Tarantula—This group of mines in the western part of the county has been placed under bond to Chas. Kunz. There is a 10-stamp mill on the property and a force of men will soon start work on a large scale. Mr. Kunz is acting for the Stauffer Chemical Company of San Francisco.

Lucky Spot—This company has been incorporated at Anderson with W. C. Barkuloo as president and James E. Isaacs, of Redding, is secretary. The mine is an old placer, near Ingot, which has been idle for years owing to litigation. The courts decided adversely to the Southern Pacific railroad and favorably to the miners, so the mine will now be worked.

SIERRA COUNTY

Cold Spring—At this mine, Mount Vernon, Asa L. Wilson is taking gold from the channel. It is worth at the mint \$2005 per ounce. The gravel will be washed as soon as the water flows.

SIERRA COUNTY

Gravel—F. S. Clark is opening his gravel claims near the Four Hills power house, 16 miles from Downieville. Mr.

Clark relocated this ground lately after having left it for 41 years.

SISKIYOU COUNTY

Eastlick—It is expected that this hydraulic property, with its ditches, pipe lines, etc., will be purchased by Gardner & Weed, of Oro Fino.

Corson & Cradle—Newcomb & Cradle have uncovered a rich ore-shoot in this quartz mine at Oro Fino.

TRINITY COUNTY

Birdie M.—In this mine at New River, H. S. Nonemaker, the owner, has opened a 3-ft. ledge running \$16 gold and \$3 silver per ton.

Trinity Center Gravel—A large acreage of gravel underlying the entire town of Trinity Center is being prospected by drills to see if it is valuable enough for dredging.

TUOLUMNE COUNTY

Gold Spring Cottage Ranch—This proposition between Sonora and Jamestown is being worked as a mine by McLaughlin, Heeseman and Bedig who are to pay Mr. and Mrs. E. J. Doherty \$10,000 for it. Work on the property has commenced.

Horseshoe Bend—This property has been conveyed to the Empire Gold Mining Company. Considerable money has been spent on the mine.

Black Oak Mining Company—The mill at this property, Soulsbyville, is now at work on ore found on the seventh level. For over a year past S. A. Knapp and associates have been at work reopening the mine.

App—Ore of "candle box" value has been struck in a drift on the 1300-ft. level. The property is owned by W. A. Nevills. Five stamps are running.

Gold Crater—After four years' work at Knight's creek, J. H. Adams and associates have tapped a good vein at 220 ft. depth.

Sell—This old mine at Sonora has been leased for ten years to S. C. Irving, of Berkeley, who will now develop it on a large scale.

Colorado

BOULDER COUNTY

United States Gold Corporation—Arrangements have been made by Secretary John R. Wolf, of Boulder, to build a mill of 150-tons capacity which will handle the ores of the company at Sugar Loaf as well as custom ores.

John Jay—This property at Jamestown,

now controlled by J. A. Reynolds, of Chicago, Ill., will be equipped with a cyanide plant for the handling of the low-grade ores. About 200 tons of high-grade smelting ores were recently shipped.

Vancluse—This company has purchased the Yellow Pine mine at Crisman, near Sugar Loaf and will install machinery. Rufus C. Wood, Boulder, Colo., is manager.

Bailey Mill—John H. Kemp, of Boulder, Colo., who has been in the East to finance this property, has written that arrangements have been completed for the remodeling of the mill and making its initial capacity 50 tons per day. The mill is located in the Eldora district.

CLEAR CREEK COUNTY

Allen Group—Texas men have become interested in this group of 17 claims in the Cascade district and the property will be developed through the Burns-Moore tunnel.

Banner Consolidated—A large amount of development work has been outlined by Manager Fred H. Nye, of Idaho Springs, and it is the intention of the company to take out the product through the Rockford tunnel on Clear creek, where a mill is to be built.

Geneca Extension—Fort Worth, Texas, capital has become interested in the Star group in the Peru district, and liberal development will be carried out.

Empire Tunnel Company—This company will install a new system of ore dressing, and it is said that the company controlling the Michaelson patents have made a proposal to take a 10-year lease on the property and erect a 200-ton plant. The property is at Empire, Colo.

Dorit—Extensive operations are to be carried on through the Peters tunnel, including the installation of an electric-power plant, also the future erection of a 100-ton plant for treating ores. William Broad, Idaho Springs, Colo., is manager.

Silver Horn—Robert McLean, of Idaho Springs, has opened a high-grade vein in the adit of this property.

Alice Gold Mines Corporation—Plans are well under way for the erection of the 300-ton plant for handling the low-grade bodies of the Alice mine in the upper Fall River district. Several buildings are now being erected for the use of the men and with fine weather the construction work will be rushed. A. H. Roller and W. L. Shaffer, Idaho Springs, are in charge.

GILPIN COUNTY

North Gilpin—Denver and Eastern men have become interested in a group of claims in Moon gulch and will install machinery. J. S. Fagrellius, Rollinsville, Colo., is manager.

East Boston—The property of this company situated in the Central City district was sold at trustees' sale and was bid in

by Amos F. Adams, of Boston, Mass., for the sum of \$22,686.

Senator—This company contemplates the installation of an air compressor for driving the tunnel. M. J. Ryan, Central City, Colo., is superintendent.

Idaho

SHOSHONE COUNTY

According to reports filed with the county assessor, the net profits of the principal mines in the Cœur d'Alene district, for 1908, were as follows: Bunker Hill & Sullivan, \$901,721; Hercules, \$383,752; Hecla, \$108,799; Standard, \$693,124; Last Chance, \$221,610; Morning, \$16,855; Snowstorm, \$162,149. The Tiger-Poorman shows a loss of \$41,860.

Indiana

BARTHOLOMEW COUNTY

The coal deposit found on the Ott farm, near Lowell, is creating considerable interest. Investigation is said to have proved the existence of a vein of coal 8 ft. thick. This is the first coal discovered in this territory and development will be pushed.

CLAY COUNTY

Treager Coal Mining Company—This is the name of a new organization incorporated during the week. The company is well financed to carry out its declared purpose of carrying on the business of mining for coal, clay and shale. William F. Treager, John H. McLaughlin and Samuel R. Treager, directors.

GREENE COUNTY

Miners in the Jasonville district are encouraged over the outlook for steady work at the mines this summer. The selling of the Walsh property they regard as a good omen, since the new company has already begun to make arrangements to start the idle mines.

PIKE COUNTY

Pike County Coal Company—This company, with headquarters in Huntingburg, which has been operating the Winslow mines, has ceased operation.

SULLIVAN COUNTY

On May 11, \$100,000 was paid out in wages to the miners in this district. It was the largest amount that has been paid at any one pay day in this county for the past 10 months.

Keystone Mine—A fire was started from a windy shot May 11, and continued to burn for five days. The fire was in the part where there was a large area of old workings, and the draft was such that men could not approach within 100 ft. of the blaze. Sixteen men fought the fire at a time, shifts being changed frequently. These attempts proved futile and the Pittsburg and the Urbana rescue stations were appealed to for assistance. The rescue men brought with them oxygen helmets

and were able to get quite close to the fire and began playing on it with two streams from hose.

VANDERBURG COUNTY

Ohio Valley Coal Company—The mine, near Evansville, started May 12 and several hundred miners were given work. The mine had been closed for several weeks because of slack demand for coal.

VERMILION COUNTY

The total payroll for the miners of the Clinton field for the past two weeks amounted to \$70,000. The recent change in the control of the Dering mines, which have been leased by the Brazil Block Company, has been followed by better work at the mines of that company.

VIGO COUNTY

Vandalia Mining Company—A controversy has started with the officials of the United Mine Workers over the demand of the men that they be permitted to remove the top coal at mine No. 65 east of Terre Haute. When the company ordered that coal be left at the top, the mine committee ordered the men to quit work, and the superintendent in turn discharged the committee. The company contends that the coal must be left as a support to the roof of the mine; that the State mine inspectors has served notice that it must not be removed. The miners say they have a right to mine all the coal of the vein, and if any is left they are, entitled to extra pay.

Maryland

Consolidation Coal Company—It is announced that arrangements have been completed for merging in this company the Fairmont Coal Company, the Somerset Coal Company, the Clarksburg Fuel Company, the Pittsburg & Fairmont Fuel Company and their subsidiaries, including railroads, floating equipment, docks and other property owned. The companies own about 200,000 acres of coal lands in Maryland, Pennsylvania, West Virginia and Kentucky. Their combined capital stock is \$37,600,000, but it is not stated what amount of new stock will be issued to complete the merger. No important change in management is involved; the Consolidation Coal Company—which is the oldest and largest company in the Cumberland, or George's Creek basin, and which owns the Cumberland & Pennsylvania railroad—has held controlling interests in the other companies named for some time. The merger will place the entire property under one head and simplify the management and accounts.

Michigan

COPPER

Michigan—This company has opened up the crosscut that was extended from "C" shaft several years ago to cut the lode recently opened in the old adit working on

the Bee tract. The lode at this point was practically void of copper and nothing further was done at the time, but owing to the exceptional good showing on the Bee tract it was decided to drift on the formation from this point.

Oreca—Diamond drill work is in progress in view of opening the same formation that was revealed on the lands of the New Baltic Exploration Company. This lode traverses the entire tract of the Oreca.

Mass—This company is operating two drills in drifting on the new lode recently opened by the crosscut from the 17th level.

Winona—All activities are centered at No. 4 shaft, blocking out stoping ground. Operations at No. 3 shaft have been temporarily suspended as sufficient ground has been blocked out to supply a stamp head for several years. This company contemplates the erection of a stamp mill in conjunction with the King Phillips property. Plans and a site have been selected. As soon as this is completed, production can go forward from these two shafts without interruption.

Quincy—Sinking is going forward at the No. 9 shaft and a depth of about 400 ft. has been obtained. Copper indications are appearing from time to time, but it is not expected commercial values will be encountered before the 2000-ft. level has been reached. The company is operating four producing shafts, Nos. 2, 6, 7 and 8, and shipping about 4000 tons of rock daily to the mill.

New Baltic—This company is operating a core drill on its lands and has a hole down about 150 ft. A core has been taken out showing some copper.

Wyandot—This company continues driving the crosscut from the bottom of its exploratory shaft, a distance of 700 ft. from surface. Several copper bearing formations have been cut.

Ojibway—The No. 2 shaft has reached the lode by means of the crosscut from the 800-ft. level, about 60 ft. from the shaft and found it well charged with copper. This is what is known as the foot-wall bed and when opened in the level above carried practically no copper. No. 1 shaft has also cut this bed in the station at the same level. Sinking has been temporarily suspended in both shafts while crosscutting is underway.

IRON—MARQUETTE RANGE

Empire—At this mine, in the Cascade district, the working force has been increased, and shipments will be pushed.

Richmond—Work has been resumed and 100 men are now employed.

Volunteer—Diamond drilling is in progress. The property was recently bought by Thomas F. Cole and others from the Alger estate.

Minnesota

A test case is to be made in a suit to be brought by the attorney-general of the State, under the law recently passed, which declares that the State is the owner of all ore beneath meandered lake beds. Lake beds, whether farm land, ore land or something else, belong to the owners of the land around them, known as the riparian owners, unless the State declares its ownership, and even then there is some question of the validity of such a law. This suit will be brought against the operators of the Long Year Lake mine on the Mesabi. They have not only stripped the land between the meander line and the water line, but test pits have been made in the water and in some places ore has been found under the lake. The right to mine this ore will be tested.

IRON—CUYUNA RANGE

The new Cuyuna Range Railroad Company is making contracts to carry iron ore, in which it is agreed that the railroad shall be finished by June 1, 1910. The road will connect with the Minneapolis, St. Paul & Sault Ste. Marie railroad.

Rogers-Brown Ore Company—A four-compartment shaft is being sunk near Dearfield, in the Rabbit Lake district. Some ore has already been taken out.

IRON—MESABI RANGE

Good progress is being made with the extension of the Great Northern railroad from Nashauk, and it is expected that trains will be running in August.

Crosby—Shipments are being made from this mine, near Nashauk, owned by the Cleveland Cliffs Iron Company.

Leetonia—The Jones & Laughlin Company has begun shipments from this mine near Hibbing.

Pearson—This mine, near Nashauk, is shipping this season for the first time. Development is still going on. The mine is owned by Joseph Sellwood.

Higgins—This mine, at Virginia, has been started up. It is a Steel Corporation property, and was not worked last year.

Mahoning—This mine, near Hibbing, was one of the first shippers on the range this year. It is expected to send out about 1,000,000 tons for the season.

Morton—The sinking of the concrete shaft at Tod, Stambaugh & Co.'s new Morton mine, at Carson lake, two miles southwest of Hibbing, is making satisfactory progress. A depth of 150 ft. has been attained. The ledge which caps the orebody will be encountered at a depth of, approximately, 100 ft., after which the shaft will be firmly anchored in the rock and the work of development will be undertaken.

Silver—M. A. Hanna & Co. are putting down a new spur to the railroad at Vir-

ginia, with a view to shipping largely this season.

Missouri

JOPLIN ZINC-LEAD DISTRICT

Alladin—Fire destroyed the mill on the St. Paul ground at Spring City. A new mill will be built. Don McKuer is manager.

Continental Zinc Company—This company is making a splendid run for the first month after production has been resumed. Mules have been put in the mine to haul the cars and the steam shovel has been discontinued.

J. Wooley—A new 100-ton mill has been completed on the American land east of Joplin, near the old Dividend, and is ready for production.

Montana

BUTTE DISTRICT

Davis-Daly—The company is expending about \$30,000 monthly on development work. Negotiations are pending for contracts with the Amalgamated interests whereby ore may be shipped to the Washoe or Great Falls smelters for treatment. It is possible that the smelter of the Basin Reduction Company may be used in the event that satisfactory contracts with the Amalgamated cannot be made.

Butte & Superior—A strike of copper ore has recently been made on the west drift on the 1400-ft. level. The grade and extent of the lead cannot be determined until further development work is done.

Butte & Milwaukee—It is reported that operations will be resumed shortly. The property lies immediately north of the Butte & Superior ground.

FERGUS COUNTY

Cumberland Mine—The mine is producing steadily under the direction of A. S. Wright, who has a lease on the property. A short time ago a shipment of 28 tons of gold ore was made which netted \$250 per ton.

GRANITE COUNTY

Binetallic—Work has been begun on the company's new cyanide plant at Phillipsburg. Five 100-ton concrete tanks will be built. President Fusz, of the company, has arrived from St. Louis and will attend the annual meeting of stockholders to be held in June.

MISSOULA COUNTY

Black Traveller Mining Company—The property is a copper prospect and is situated near Saltese. A tunnel is now in a distance of 1050 feet.

Nevada

ESMERALDA COUNTY—RAWHIDE

Mint Lease—The shaft is in good ore at the 320-ft. level, and three shifts are employed.

Marigold Lease—High-grade ore ship-

ments are made every week. The rich streak still continues on the 160-ft. level.

Grutt Ballon—This lease, which is considered the best in the camp, is shipping regularly to the sampler at Hazen, Nev. The ore will average \$300 to the ton.

Prosky No. 1—This lease has rich gold ore on the 100-ft. level, and is shipping high-grade ore to the mill.

Kaufman Lease—A 4-in. vein of high-grade gold ore was recently struck on the 100-ft. level and is now being sacked for shipment. This is reported to be one of the richest stringers ever struck in the camp.

Black Eagle—A new 6-h.p. hoist has been erected on this property in the western part of the district. The mine is being investigated by an Eastern firm with the view of purchasing.

King-Heisner—It is expected that the cyanide mill will be ready for operation by June 25. The mill will have a complete sampler.

ESMERALDA COUNTY—HAWTHORN

Lucky Boy—It is reported that the United States Smelting, Refining and Mining Company has an option on this silver-lead property. One hundred and thirty men are employed.

ESMERALDA COUNTY—LUNNING

Toft—This group of copper claims is now being examined by Boston people, with a view of purchasing.

New York

ESSEX COUNTY

The usual yearly report of the discovery of gold in the Adirondack region has come; this time from the neighborhood of Lake Placid, where it is said a prospector has found a vein, specimens of which assay very high in gold. It is not likely that this will amount to more than previous "discoveries" of the same sort.

North Carolina

RANDOLPH COUNTY

Ashboro Gold—A charter was recently granted the Ashboro Gold Mining Company, of Asheville. The capital stock is \$50,000. Incorporators, W. W. Taylor, of Chicago; W. P. Johnson, of Philadelphia, and J. T. Winslow, of Ashboro.

ROWAN COUNTY

Union—Under the management of Walter George Newman, this mine is producing gold bullion steadily from the 20-stamp mill.

Gronite Quarry—Secretary of State has granted a charter for the amalgamation of the Balfour Pink Granite Company, the Rowan Granite Company and the American Stone Company. Capital of the new company is \$1,250,000 paid in. Over 2000 men will be employed. The quarries are three miles from Salisbury. Branch

offices will be established in New York, Philadelphia, Toronto and other important centers.

Oklahoma

OTTAWA COUNTY

Miami Zinc District—The Wauhullian mill has been completed and is ready for production. The Little Maxine is erecting a mill. The Last Chance and Blue Bell have contracted for mills.

Pennsylvania

ANTHRACITE COAL

Philadelphia & Reading Coal and Iron Company—This company's statement for March and nine months of its fiscal year from July 1 to March 31 is as follows:

	March.	Nine Mos.
Earnings	\$2,855,841	\$25,688,967
Expenses	2,591,997	24,284,153
Net earnings	\$ 263,844	\$1,424,814

For the nine months there were decreases of \$2,748,896 in earnings, of \$2,116,150 in expenses, and of \$632,746 in net earnings, as compared with last year.

BITUMINOUS COAL

Pittsburg Coal Company—This company's fiscal statement for the three months ended March 31 is as follows:

	1908.	1909.	Changes.
Net earnings ..	\$ 618,993	\$ 429,199 D.	\$ 189,794
Charges	641,381	694,652 D.	46,729
Surplus	\$ 126,388	\$ 166,453 I.	\$ 40,065

The charges this year were \$106,998 for depreciation of coal lands; \$231,967 for depreciation of plant and equipment; \$255,687 for interest on.

South Carolina

YORK COUNTY

Darwin—At this property the Cripple River Hydraulic Company, of New York is sinking a 100-ft. shaft in order to exploit a vein at that depth which has produced good ore from the surface.

South Dakota

LAWRENCE COUNTY

Imperial Mining Company—The miners are engaged in sinking through the porphyry which blocked drifting in the quartzite level of the Dakota shaft. It was first supposed to be a dike, but turned out to be faulted porphyry capping. The shaft has gone down 80 ft., passed through the porphyry, and is now in shale, probably close to quartzite.

Nebraska—A strike of good milling ore is reported on the Connie-May-Morris ground, near Roubaux, which is being worked under lease by the Nebraska Mining Company.

PENNINGTON COUNTY

Forest City—This company, operating the Clara Belle mine, near Hill City, has begun the erection of a cyanide plant to

treat the tailings from the amalgamation mill. The recovery by amalgamation is about 50 per cent.

Mariposa Mining Company—This company is about to begin the erection of a hoist on the property at the head of Burnt Fork creek. The shaft, which is down 200 ft., will be sunk another 100 ft. Later a 100-ton mill is projected on Slate creek southeast of Mystic.

Texas

MARION COUNTY

Jefferson Iron Company—This company has bought the property of the Lone Star Iron Company at Jefferson, and is negotiating for the purchase of several large tracts of land containing iron-ore deposits. The headquarters of the company are in St. Louis; the officers are A. P. DeCamp, president; N. P. Withington, secretary and treasurer.

TARRANT COUNTY

American Fullers' Earth Company—Preparations are being made to increase the plant from 20 tons to 50 tons daily capacity. The company has a lease covering 2500 acres of land near Fort Worth.

Utah

BEAVER COUNTY

Utah Gold and Copper—A force of men is now finishing the laying of a 2000-ft. line of 6-in. pipe for carrying water to the mouth of the tunnel. This will be used to develop power for blowers for ventilating the mines, and also for operating an electric-light plant. Lumber for bunk houses, office and blacksmith shop is being hauled from Modena. The buildings will be completed in about three weeks. Ore shipments will be increased in the near future.

Orphan Boy—W. J. Merritt and associates have taken control of the Orphan Boy property in the Star district consisting of 11 claims. At present there are about 1200 ft. of tunnel and 500 ft. of shaft. It is the intention of the new company to commence work on a double compartment shaft to be sunk to the 1000-ft. level.

Golden Reef—This company with properties at Beaver Lake recently listed its shares on the Salt Lake exchange. The company is capitalized for \$100,000, represented by 500,000 shares of stock of par value of 20c. The property consists of 27 claims surveyed for patent, and the development consists of 500 ft. of shafts, 1900 ft. of tunnels and 60 ft. of winzes. The shaft is equipped with a 15-h.p. gasoline hoist and 10 men are employed at the present time.

JUAB COUNTY

Swansea Extension—In the north drift on the 200-ft. level below the tunnel disclosures have been made of fine lead ore. The ore body is about 300 ft. below the surface.

Tintic Mines Company—The officers have ordered the 135-ft. shaft on the Town View claim to be retimbered and deepened. The movements of this company have been watched with considerable interest since the purchase of several claims north of the Victoria and east of the Eagle & Blue Bell.

SALT LAKE COUNTY

Butler-Liberal—A new compressor is being installed and as soon as it is in working order the shaft will be deepened to get under the orebody opened up some months ago on the 227-ft. level. The company has at this level a breast of 14 ft. of good ore.

Columbus Consolidated—Two new 2½-ton electric motors have been placed in commission in the main operating tunnel. These motors run from power derived from storage batteries which are charged from the company's hydro-electric plant. Each motor is capable of handling 12 cars of ore. The foundations are ready to receive the new electric station pump, which is now en route. A new strike has been made on 300 level in the Garfield fissure.

SEVIER COUNTY

Sevier Consolidated—It was reported that the right vein that the former owners of the Sevier Consolidated had lost through faulting has been recovered. The vein was faulted to the west with its dip reversed. A crosscut to the west on the 85-ft. level has caught the vein.

TOOELE COUNTY

Consolidated Mercur—Owing to failure of the ground under part of the leaching department of the cyanide mill, eight large leaching tanks, collapsed precipitating their contents on the floor of the mill. There was no loss of life the unloading crew being in another part of the mill at the time of the accident. Reserve tanks were put into use and the capacity of the mill will not be seriously curtailed.

Virginia

FLOYD COUNTY

Work has been resumed at the arsenic mines in this county, after a shutdown of several years.

Washington

JEFFERSON COUNTY

James A. Moore, of Seattle and associates are installing a steel plant at Irondale to be completed within six months. Mr. Moore has control of large deposits of hematite ore in Washington.

WHATCOMB COUNTY

International Lime Company—The company has purchased 160 acres of land containing raw material for the manufacture of cement. It is reported that a plant will be built soon.

Wisconsin

IRON—GOGEBIC RANGE

A syndicate having its headquarters at Ironwood, Mich., has bought a 40-acre tract north of the Ottawa and Windsor mines, and has begun to test it by drilling.

Canada

ONTARIO—COBALT DISTRICT

Ore Shipments—Shipments of ore from Cobalt camp for the week ending May 8 were: Coniagas, 65,400 lb.; Crown Reserve, 102,816; Kerr Lake, 122,201; La Rose, 327,300; Nipissing, 337,090; Temiskaming, 150,060; Temiskaming & Hudson Bay, 60,000; total, 1,164,807 pounds.

Little Nipissing—A new hoist and boiler are being installed on the company's location J. B. 2, the shaft on which will soon be down to the 125-ft. level, where drifting will be carried on. A new vein 16 in. wide of vein matter carrying 2 in. of cobalt is reported to have been struck about 4 ft. from the main vein on the company's Peterson Lake lease.

Muggley Concentrators, Ltd.—From April 19 the name of this company has been changed to Northern Customs Concentrators, Ltd.

Ophir—A plant consisting of a 100-h.p. boiler and six-drill Sullivan compressor is being installed. No. 1 vein has been traced by stripping for 1300 ft. and on the surface shows native silver and nicolite. There are five other promising veins on the property.

Pan Silver—On this property, adjacent to the Temiskaming, six shafts have been sunk. The deepest is the main or No. 4 shaft, down 180 ft., from which 380 ft. of drifting has been done at the 100-ft. level, and a vein carrying native silver encountered. The shaft is being put down to 200 ft. Shaft No. 5 is down 60 ft., and drifting was recently started at that level on a 7-in. cobalt-calcite vein showing native silver contents. Development work is at present confined to these shafts, and diamond drilling is being carried on at the south end of the property to pick up some of the Gifford Extension veins.

ONTARIO—MONTREAL RIVER DISTRICT

Elk Lake—This company, controlled by the Hawthorne syndicate, is installing a plant, comprising a five-drill compressor, two 60-h.p. boilers and a hoisting engine.

Otisse—Work is steadily progressing and a large quantity of ore has been sacked ready for shipment on the opening of navigation.

YUKON

An important strike of paying gravel was made recently on Miller creek, in the Glacier creek district. The strike is on ground that is open to entry, and a number of miners and prospectors have gone to the district.

Another strike, which has caused much excitement is on Hubbard creek in the

Fortymile district. This is reported to be rich.

Mexico

SONORA

Black Mountain—Oil is to be used for fuel in place of coal. About 250 men are employed. Chief Engineer S. E. Powers was killed recently by falling into a concrete oil pit.

El Globo—Work is being pushed by means of a small air drill on the 1600-ft. prospect tunnel which is calculated to cut the vein at a depth of 1000 ft. C. A. Romadka, of Douglas, Ariz., is general manager.

El Van Mining Company—One thousand feet of development work have been done on the property near Nacoziari. A large body of concentrating copper ore was encountered; also a body of 10 per cent. ore. Fritz Kohlmeyer is manager.

Pavo Rico—This mine, owned by N. S. Finch, is under option to O. L. Neer and Geo. B. Hosier, who have a small force of men at work, and have a shipment of ore ready for the smelter.

Promontorio—C. B. Dunster recently made an examination for Michigan parties. The mine is a short distance below Moctezuma.

Pura Plata—The mine about 15 miles west of Moctezuma, has been secured on a \$30,000 bond and lease from Geo. F. Woodward and associates. W. P. Belding, of Los Angeles, the new owner, will start work on the property at once.

Silver Seal Exploration Company—Three cars of high-grade gold-silver-copper ore are being shipped to Douglas. The ore is maintaining its silver and copper value, with an increase in the gold contents. Dr. A. Sandberg, of Nacoziari, is superintendent.

Lucky Tiger—The directors' report, March 17, 1909, states that for the year ending Dec. 31, 1908, the total prospecting and development work in drifts, raises and crosscuts was 10,230 ft. The mine produced 2014 tons of first-class ore, yielding \$471,425, and 1426 tons of concentrates, worth \$330,063. Net returns from smelters \$713,297. Dividends paid during the year, \$71,500.

Australia

NEW SOUTH WALES

Gold production in April is reported at 21,360 oz., an increase of 626 oz. over April, 1908. For the four months ended April 30 a total of 77,112 oz. is reported this year.

WESTERN AUSTRALIA

Gold production in April was 137,764 oz., being 10,770 oz. more than in March, but 7951 oz. less than April, 1907. For the four months ended April 30 the total production was 556,356 oz. in 1908, and 520,141 oz.—or \$10,751,314—in 1909; a decrease of 36,215 oz. this year.

Metal, Mineral, Coal and Stock Markets

Current Prices, Market Conditions and Commercial Statistics of the Metals, Minerals and Mining Stocks

QUOTATIONS FROM IMPORTANT CENTERS

Coal Trade Review

New York, May 19—The coal trade in the West, while still subject to fluctuations, seems to be approaching more solid ground. The steady, if slow, increase in the demand for steam coal is making itself felt and the trade is more active than at any time during the past 18 months. It has not yet approached anything like a boom stage, but has advanced considerably beyond its period of greatest depression. The Lake trade opens rather slowly.

In the East the bituminous trade remains more quiet than in the West, but the time is approaching when Seaboard consumers must lay in stocks, and sellers are rather encouraged; though trade is not yet active a better feeling is manifested.

The anthracite trade is quiet and will probably remain so until accumulated stocks are worked off. This will take some time and the larger companies are running many of their collieries on short time. It is probable that May will show a lighter production of anthracite than any month this year—certainly less than in March and April.

The report that the controlling interest in the Chesapeake & Ohio road had been sold to the Pennsylvania Railroad Company seems to have been premature, since it has been contradicted. The present owners of the road announce that they are negotiating for new connections and extensions, but it is quite possible that this is only intended to promote the sale which is evidently desired. Meantime it is to be noticed that the pushing of West Virginia coal in the Seaboard markets is less aggressive than it has been.

Tidewater Coal Demurrages—Charges have been filed with the Interstate Commerce commission by Peale, Peacock & Kerr, shippers of bituminous coal from central Pennsylvania, against several of the carrying roads. The complainants claim that demurrage and other charges are levied at tidewater points which, in effect, discriminate against the smaller independent shippers.

COAL TRAFFIC NOTES

Tonnage originating on Pennsylvania railroad lines east of Pittsburgh and Erie, year to May 8, short tons:

	1908.	1909.	Changes.
Anthracite.....	1,927,189	1,868,727	D. 58,462
Bituminous.....	11,415,858	12,361,866	I. 945,998
Coke.....	2,447,880	3,497,090	I. 1,049,210
Total.....	15,790,927	17,738,173	I. 1,947,246

Increase for the week, 157,788 tons. The total increase this year to date was 12.3 per cent.

Bituminous coal and coke shipments, Pennsylvania and West Virginia, three months ended March 31, short tons:

	Coal.	Coke.	Total.
Balt. & Ohio.....	4,730,391	990,562	5,720,953
Buff. Roch. & Pitts.	1,402,009	109,839	1,511,848
Buff. & Susquehanna	397,719	81,738	479,457
Penn. Lines, N. Y. C.	1,971,569	22,092	1,993,661
Pitts. & L. Erie.....	1,618,669	1,006,246	2,624,915
Norfolk & Western.	2,830,534	644,899	3,475,433
Ches. & Ohio.....	2,860,329	116,285	2,976,617
Total.....	15,801,210	2,971,964	18,822,874
Total, 1908.....	15,602,068	1,961,291	17,453,359

Total increase, 1,397,215 tons, or 8 per cent. In addition the Baltimore & Ohio carried 212,109 tons anthracite in 1908 and 242,249 in 1909; increase, 30,140 tons.

Tonnage of Chesapeake & Ohio, nine months July 1-March 31, short tons:

	Coal.	Coke.	Total.
New River.....	4,841,867	192,349	5,034,206
Kanawha.....	3,914,186	21,866	3,822,072

Norfolk.....		416,889	416,889	4.2
Total.....	4,412,913	5,436,540	9,848,453	100.0
Total, 1908.....	3,909,051	5,386,406	9,295,557	

Total increase this year, 552,896 tons, or 5.9 per cent. New York includes all the harbor shipping ports.

Coal receipts at St. Louis three months ended March 31 were 2,251,497 short tons in 1908, and 1,774,835 in 1909; decrease, 476,662 tons.

Coal passing through Lock No. 3 on the

Monongahela river three months ended March 31 was 2,246,240 short tons in 1908, and 2,371,240 in 1909; increase, 125,000 tons.

Coal passing through Davis Island dam on the Ohio river three months ended March 31 was 841,555 short tons in 1908, and 1,335,445 in 1909; increase, 493,890 tons.

Shipments of coal by water from Seattle and Tacoma, Wash., three months ended March 31 were 163,021 tons in 1908, and 63,662 in 1909; decrease, 99,359 tons. These shipments are chiefly to California and Alaska ports.

Coal passing through the Sault Ste. Marie canals for the season to April 30 short tons:

	1908.	1909.	Changes.
Anthracite.....	2,032	18,816	I. 16,784
Bituminous.....	12,648	108,969	I. 96,321
Total.....	14,680	127,484	I. 112,804

The United States canal at the Sault was opened April 20, and the Canadian canal April 21, about the same dates as last year.

Coal receipts at Boston, four months ended April 30, reported by Chamber of Commerce:

	1908.	1909.	Changes.
Anthracite.....	540,180	556,101	I. 15,921
Bituminous.....	1,038,936	1,067,693	I. 28,757
Total domestic.....	1,579,116	1,623,794	I. 44,678
Foreign.....	176,450	95,986	D. 79,465
Total.....	1,754,566	1,719,779	D. 34,787

The foreign coal is chiefly from the Nova Scotia mines.

New York

ANTHRACITE

May 19—Trade is dull and the general anticipation is that it will remain so for a while until the present stocks are worked off.

Prices on domestic sizes are \$4.35 for lump and \$4.60 for egg, stove and chestnut, f.o.b. New York harbor. For steam sizes current quotations are \$3.10@3.25 for pea, \$2.35@2.50 for buckwheat, \$1.70 @2 for rice, \$1.25@1.50 for barley, f.o.b. New York harbor.

BITUMINOUS

The Seaboard trade is said to be improving, but it is so slow that sharp eyes are required to see the change. If anything, more orders are coming from the far East, while business along the Sound continues regular though of small proportions. New York harbor shows no improvement. Prices are unchanged and there is no surplus coal to speak of, ship-

pers adhering to the plan of forwarding coal to tidewater only on orders. All-rail trade is the best. Transportation and car supply continue good. Some coal is 'still being taken for outside shipment.

The Coastwise trade continues rather dull and vessels are in good supply. Rates are unchanged. For large vessels from Philadelphia they are: To Boston, Salem and Portland, 55c.; Portsmouth, 70c.; Lynn, Newburyport and Bangor, 75c.; Providence, New Bedford and the Sound, 55c. per ton.

Birmingham

May 17—The coal trade in Alabama is still dull and the production is at low-water mark. In the Alabama coalfields the miners' union is now practically inactive, the few companies recognizing the union not giving employment to a sufficient number of men to warrant any boasting by the organization. There is a probability that no convention of the union will be held this year; in fact the officers of the union have no statement to make that is hopeful. There is considerable activity in coke in this State.

Chicago

May 17—Steam coals continue in steady, though not yet large demand, with lump becoming hard to sell and screenings in better demand. The interest of the trade now centers largely in contract making, prices in which are very low. The Illinois and Indiana supply is well regulated; except for occasional cargoes of lump coal there is practically no demurrage trouble. The domestic trade is fast settling into a state of summer dullness.

Lump and egg from Illinois and Indiana bring, \$1.75@2.25; run-of-mine \$1.65@1.75, and screenings, \$1.35@1.65.

Hocking continues in large supply and has some sales at forced low prices to escape demurrage, quotations being \$2.85@3. Smokeless continues in well-regulated supply, but has somewhat light sales, lump bringing \$3.20@3.45 and run-of-mine \$2.95@3.15.

Anthracite sales are somewhat light, but the general volume of business exceeds the record of previous spring seasons so far.

Cleveland

May 18—Lake trade is slow. There has been some chartering, but small vessels are scarce, and are asking a higher figure. Big boats will only go to the ore ports, where quick discharge can be had. The strike makes little trouble so far as the boats are concerned.

Steam trade does not improve as fast as expected. Ohio coal sells at \$1.25 for lump, \$1 for run-of-mine and 75c. for slack, all at mine, Middle District. No. 8 District coal can be had at \$1.10 for lump, 85c. for run-of-mine and 60c. for slack, all at mine.

Indianapolis

May 17—Irrregularity still characterizes the coal-mining industry of this State. The first week in May usually affords an index for the summer's work, and the record offers some encouragement. The operators say that the demand for coal is increasing gradually, but admit that when mine-run coal is down to 85c. a ton they can make little, if any, profit.

The United Fourth Vein Coal Company, in the Linton district, has landed sufficient orders to keep the mines fairly busy all summer. All the mines of the Vandalia Company are working now and the company is well fixed for the summer. The Shirley, the Little Giant and the Summit Mining companies report fairly good prospects of steady operation.

The operators are somewhat exercised over the apparent purpose of the Steel Trust to secure control in the Indiana coalfields. The Clinton field, where the Illinois Steel Company has secured a large interest, lies between the Deering property on the north and the, Walsh mines on the south. It is considered very probable that Steel Corporation interests will secure control of one or both of these properties.

Pittsburg

May 18—Lake shipments are improving a little, but not to any great degree, though mines are getting ready for the trade. The local trade improves slowly. Prices are low, and in this respect the market does not gain. The outside price for mine-run is \$1.10 for ordinary lots, and \$1 has been done on large quantities. About 55@65c. may be quoted for slack.

Connellsville Coke—Negotiations for the proposed merger of independents continue quietly, and appraisals are being made of several of the plants.

Standard furnace coke is held at about \$1.60 for spot, with \$1.75@1.90 on second-half contracts. Foundry is \$1.85 @1.90, with \$2@2.75 asked on contracts. The Courier reports production in both Connellsville regions at 244,279 tons for the week, an increase of 14,572 tons over the previous week.

Foreign Coal Trade

German Coal Production—Coal production of the German Empire, three months ended March 31, metric tons:

	1908.	1909.	Changes.
Coal	37,697,874	36,477,870	D. 1,220,004
Brown coal.....	16,604,727	16,815,920	I. 211,193
Total mined....	54,302,601	53,293,790	D. 1,008,811
Coke made.....	5,471,331	5,243,787	D. 227,544
Briquets made..	4,419,351	4,506,769	I. 87,418

Of the briquets reported this year 3,575,083 tons were made from brown coal, or lignite.

German Coal Trade—Imports and exports of fuel in Germany, three months ended March 31, metric tons:

	1908.	1909.	Changes.
Imports:			
Coal.....	2,351,949	1,982,157	D. 369,792
Brown coal.....	2,201,737	1,801,163	D. 400,574
Coke.....	130,791	181,349	I. 50,558
Briquets.....	48,816	45,982	D. 2,834
Exports:			
Coal.....	4,929,300	5,241,817	I. 312,517
Brown coal.....	6,068	7,326	I. 1,258
Coke.....	926,791	835,076	D. 91,715
Briquets.....	350,401	350,533	D. 19,658

Coke exports this year included 7908 tons to the United States.

Nova Scotia coal shipments, three months ended March 31, long tons:

	1908.	1909.	Changes.
Companies:			
Dominion.....	368,713	598,961	I. 230,248
Nova Scotia Steel..	61,247	117,737	I. 56,490
Cumberland.....	89,920	110,071	I. 20,151
Acadia.....	67,867	79,887	I. 22,020
Intercolonial.....	26,432	48,674	I. 19,262
.....	60,911	68,125	I. 7,214
Total.....	685,070	1,020,455	I. 335,385

All the companies showed gains this year, the total increase being 49 per cent.

Welsh Coal Prices—Messrs. Hull, Blyth & Co., London and Cardiff, report current prices of coal as follows, on May 1: Best Welsh steam, \$4.02; seconds, \$3.84; thirds, \$3.60; dry coals, \$3.78; best Monmouthshire, \$3.60; seconds, \$3.42; best small steam, \$2.76; seconds, \$2.52. All f.o.b. shipping port. This is a further advance on several kinds.

Iron Trade Review

New York, May 19—The iron and steel trades continue active and improvement can be noted in more than one quarter. Buyers seem to have been convinced that they are warranted in anticipating improvement and are, accordingly, more willing to contract for future deliveries.

In pig iron the buying of foundry material is steadily increasing in Eastern territory, and an improvement is also noted in the West. Basic iron is not quite as active, chiefly for the reason that the larger makers of open-hearth steel who buy their iron have provided for their requirements over the third quarter of the year.

In finished material structural steel continues the more active department, but there have been good transactions in bars, plates and sheets. Wire products have been advanced by the principal producer \$2 a ton above the lowest figures made. This action, it is said, is chiefly for the purpose of stopping speculative buying and it has been concurred in by several of the larger independent mills. Rail orders continue rather slow, but a number of contracts for cars have been placed and orders sent to the locomotive works are increasing their activity. Bridge orders from the railroads are coming in quite freely.

That the iron manufacturers are satisfied, is manifested by the fact that a number of companies which reduced wages last April have announced that the former standard will be established again on July 1. These companies include nearly all the more important independent producers.

The Steel Corporation has not so far made any general reduction in wages.

Lake Iron Ore—Iron-ore stocks on Lake Erie docks May 1, as compared with those on Dec. 1 are reported by the *Cleveland Iron Trade Review* as follows, in long tons:

	1907-8.	1908-9.	Changes.
Stocks, Dec. 1.....	7,388,728	8,441,533	1,052,805
Stocks, May 1.....	5,480,360	5,370,268	D. 110,092
Ship'd to furnaces	1,905,428	3,071,265	1,165,837

Adding these winter shipments to 17-,453,258 tons, the amount shipped to furnaces during the navigation season of 1908, gives 20,524,533 tons as the entire shipment of ore from Lake Erie ports during the year ended May 1, 1909, as compared with 31,692,446 tons in the preceding year; a decrease of 11,167,923 tons.

Shipments of iron ore from the upper Lake ports in April were 55,794 tons, which compares with 630,975 tons in April of last year.

Lake Iron Ore Prices—It has been practically decided to quote prices on Lake Superior ore the same as last season—Old Range bessemer, \$4.50; Mesabi bessemer, \$4.25; Old Range non-bessemer, \$3.70; Mesabi non-bessemer, \$3.50, all f.o.b. Lake Erie port. The guarantee is unchanged also, being 55 per cent. iron, base on bessemer, and 51.5 per cent. iron on non-bessemer ores.

Baltimore

May 18—Exports for the week included 3,363,800 lb. steel billets and 87,460 lb. zinc dross to Liverpool; 799,123 lb. tin scrap to Rotterdam. Imports included 518 tons ferromanganese from Liverpool; 5350 tons iron ore from Cuba.

Birmingham

May 17—Southern pig-iron manufacturers continue to sell iron, though not in big lots. The aggregate is satisfactory, equal to, if not more than, the make. The production is showing some improvement; two furnaces were started this month by the Tennessee Coal, Iron and Railroad Company. Williamson furnace, in Birmingham, which has a daily capacity of about 90 tons, will be closed down for repairs. Iron prices in Southern territory remain about the same they have been. No. 2 foundry selling at \$11.50 per ton minimum, with several of the companies holding for \$12 for delivery during the latter part of the year. The home consumption continues steady, with prospects of a better demand. Several of the smaller industries in the Birmingham district are beginning to take on renewed life. The Stockham Pipe and Fitting Company has business in hand or in sight to warrant an operation of its plant double turn. The cast-iron pipe concerns in this territory are still receiving business. The Central Foundry Company is in full op-

eration again on soil pipe after a disastrous fire several weeks ago. Machine shops and foundries throughout this sections are getting in some orders of consequence. Rumors prevail, without positive verification, that the Tennessee will shortly resume operations at the steel plant at Easley.

Chicago

May 17—Conditions in the iron market are little changed. The average buyer is taking supplies in small lots; the larger interests are in general supplied up to the fourth quarter and not anxious to contract farther ahead. It seems to be taken for granted that pig iron will not go lower in price.

Southern iron brings \$11.50@12, Birmingham (\$15.85@16.35, Chicago), for No. 2. Some sales probably continue as low as \$11, Birmingham, with some as high as \$12.25. Iron for delivery in the fourth quarter brings \$12 as a rule, the lower quotations being for delivery sooner. Northern holds at \$16.50@17 to the consumer, the price of \$16 at the furnace being made in some cases. Southern iron furnishes most of the speculative trading, Northern being quiet and comparatively steady. Lots sold are, in general, small now, running up to 300 to 400 tons. The tone of the market is one of growing confidence, as far as opinions of furnace agents are expressed.

In finished products the market sees good buying, sales of railroad materials and structural steel being large and increasing.

Coke is in better demand, but still at \$4.70 for the best Connellsville.

Cleveland

May 18—Last season's ore prices having been reaffirmed, a number of sales have been made, the total being about 2,500,000 tons, probably. The prices are: Old Range bessemer, \$4.50; Mesabi bessemer, \$4.25; Old Range non-bessemer, \$3.70; Mesabi non-bessemer, \$3.50; all f.o.b. Lake Erie ports.

Pig Iron—No large sales, but a number of small ones, making a considerable total. Prices are firmer, and no sales are made below \$15.25 for No. 2 foundry.

Finished Material—Sales of structural steel and bars continue good, with some trade in plates also.

Philadelphia

May 19—Fair sales of pig iron are reported, making up a large total. Foundry, basic and malleable have all sold, but forge iron drags behind still. Cast-iron pipe makers are in the market for some large lots of low-grade pig. Southern iron is not being pressed, though some Virginia furnaces are making offers. For foundry the basis is about \$16.25, de-

livered, for No. 2X, with 25 or 50c. more asked for fourth quarter.

Steel Billets—Current business is for small orders, prompt delivery, sellers being unwilling to take long contracts on present prices.

Bars—Sales have been moderate but prices are firmer, though refined iron is still irregular. Store trade is improving.

Plates—Demand is still irregular, but there are some large inquiries floating around.

Sheets—More business is showing up, and mills are not inclined to shade prices.

Structural Material—Several large contracts and a number of small ones are under negotiation and likely to go through. Makers are inclined to be stiffer as to price.

Scrap—The market is stronger and dealers are quite chipper. Some of them are inclined to hold back, believing they will get better prices than are now offered.

Pittsburg

May 18—The advance of \$1 per ton last week in bars and shapes seems to have been well taken. It has not checked orders, which continue good, so far as consumers are concerned. Speculative buying is not so active, though this is a matter not always easy to determine. However, jobbers are more cautious, apparently, about loading up.

The American Steel and Wire Company has advanced prices of wire and wire products \$2 per ton, and this has been done also by the leading independents. The advance does not seem to have checked orders so far, though some jobbers are holding off.

Pig Iron—Demand seems to be improving a little, but the market is still below the expectations. Prices, however, are a shade firmer. Sellers are holding out for \$14.75 for bessemer; \$14.25 for basic and No. 2 foundry and \$13.50 for gray forge, all at Valley furnaces. On large orders 25c. less might be done for early shipments.

Steel—A little more new business is reported. Deliveries continue good on old contracts. In the local market billets are firm at \$23 and sheet-bars at \$25.50, as formerly.

Sheets—Demand is better. Prices remain on the basis of 2.25c. for black and 3.25c. for galvanized, 28 gage, ordinary carloads. There is less talk of shading than there has been.

Ferromanganese—The market is quoted at \$41, Baltimore, or \$42.95, Pittsburg, for ordinary lots. For future deliveries \$1 more is asked.

Foreign Iron Trade

German Iron Production—The German Iron and Steel Union reports production

of pig iron in Germany in March at 1,073,116 tons, or 123,449 tons more than in February. The daily average increased from 33,917 tons in February to 34,617 in March. For the three months ended March 31 the total was, in metric tons:

	1908.	1909.	Changes
Foundry iron.....	583,421	560,882	D. 22,539
Forge iron.....	180,557	170,396	D. 10,161
Steel pig.....	271,250	277,416	I. 6,166
Bessemer pig.....	112,180	110,405	D. 1,775
Thomas(basic)pig	1,955,106	1,925,465	D. 29,640
Total.....	8,102,513	8,044,504	D. 58,009

Total decrease this year, 1.9 per cent. Steel pig includes spiegeleisen, ferromanganese and all similar alloys.

Metal Markets

New York, May 19—The metal markets show signs of increasing demand for manufacture and consumption, and some higher prices are recorded in consequence.

Gold, Silver and Platinum

UNITED STATES GOLD AND SILVER MOVEMENT

Metal.	Exports.	Imports.	Excess.
Gold:			
April 1909....	\$ 3,349,107	\$ 6,337,994	Exp. \$ 2,988,887
" 1908....	2,501,197	14,476,341	Exp. 11,975,144
Year 1909....	41,316,626	15,507,392	Exp. 26,809,234
" 1908....	18,335,344	19,857,221	Imp. 1,521,877
Silver:			
April 1909....	4,952,251	4,073,504	Exp. 878,747
" 1908....	4,462,564	3,407,926	" 954,638
Year 1909....	19,435,181	14,526,722	" 4,908,459
" 1908....	17,048,851	14,298,582	" 2,750,269

Exports from the port of New York, week ended May 15: Gold, \$1,798,000, to Argentina and Paris; silver, \$884,806, to London and Paris. Imports: Gold, \$149,002, from Australia and South America; silver, \$53,705, from the West Indies and Mexico.

Gold and silver movement in Great Britain, three months ended March 31:

	Imports.	Exports.	Excess.
Gold.....	£16,131,463	£10,184,832	Imp. £5,946,631
Gold, 1908....	11,167,241	8,024,886	Imp. 3,142,355
Silver.....	3,333,828	3,155,161	Imp. 188,667
Silver, 1908....	2,222,857	3,616,922	Exp. 1,393,965

Of the silver imported this year a total of £2,805,838 is credited to the United States.

Gold—There has been a demand for gold and the price on the open market in London has been 77s. 9½d. per oz. for bars. Most of the gold offered was taken for Austria. In New York exports reached \$7,000,000, about \$6,000,000 going to France, the rest to Brazil and Argentina.

Platinum—Business is dull and prices a little lower. Dealers ask \$23@23.50 for refined platinum, and \$25.50@26 for hard metal. Scrap is quoted at \$19@20.50. The market is depressed by the existence of some stocks in the hands of small holders, who are anxious to turn their metal into cash.

Silver—Silver has settled to a more steady level. China has not been so active a buyer lately, and prices have been sustained by buying from India less moderate than the China operations had been previously.

London quotations are per long ton (2240 lb.) standard copper. The New York quotations for electrolytic copper are for cakes, ingots and wirebars, and represent the bulk of the transactions made with consumers, basis New York, cash. The price of cathodes is about 0.125c. below that of electrolytic. The quotations for lead represent wholesale transactions in the open market. The quotations on spelter are for ordinary Western brands; special brands command a premium.

Copper—While the activity in this market has subsided somewhat, transactions continued during the week May 13-19 on a fair scale, and the tone remains very firm. Producers have greatly relieved themselves by the large sales effected within the last fortnight, and there is now a general appreciation that the deliveries have caught up with the production and may even surpass it. Consequently there is a great deal of confidence in the future of the market. This is manifested by the general disinclination to contract for delivery beyond July, and prices are stiffer for all future shipments than for prompt and near-by. The ideas of sellers in this respect are measured to a large extent by interest charges. None of the agencies is now aggressive in forcing sales, but for early delivery all offer electrolytic copper at 13½c., cash, delivered 30 days, or a little less than 13c., cash, New York. Some transactions were made during the week at less than 12½c. and some at a little more than 13c., but these were determined by special conditions. The case is similar with respect to certain transactions in Lake copper that were made at 13¼c.

However, the latter is understood to be the price that is now asked by the Calumet & Hecla. The closing quotations are unchanged at 13½@13¾c. for Lake copper; 12½@13c. for electrolytic in ingots, cakes and wirebars; 12¼@12½ for casting copper. The average for casting copper was 12¾@12½ cents.

Copper sheets are 16½c. base for large lots. Full extras are charged, and higher prices—up to 18c.—for smaller quantities. Copper wire is 14½c. base, carload lots at mill. Business has been steady.

The standard market in London has held its own throughout the week, and the fluctuations would indicate that there has been an evening-up process among the various factions. The close is steady at £59 3s. 9d. for spot and £60 for three months.

Refined and manufactured sorts we quote: English tough, £63 10s.; best selected, £62 10s.@£63 10s.; strong sheets, £74 10s.@£76 10s.

It is reported that the selling of the product of the Utah Copper Company will soon pass from the United Metals Selling Company to the American Smelting and Refining Company.

Tin—The increased shipments from the East, which were reported for the first half of this month, created a depressing influence in the market. Transactions, however, were of small volume and changes in the quotations of small moment. The close is cabled at £131 2s. 6d. for spot, £132 5s. for three months.

The domestic market followed closely, as far as prices are concerned, that of London. Business is reported as satisfactory and consumption seems to keep up on a fairly good level. The market closes at about 28¾ cents.

Lead—There is a good business doing, and quotations have again advanced somewhat, particularly in the West, the close in St. Louis being 4.22½@4.25c., while the metal is quoted at 4.30@4.32½c. New York.

The tone of the London market has also improved, and sales have been of a larger volume. The close is stronger at £13 6s. 3d. for Spanish and £13 8s. 9d. for English.

Spelter—Under the influence of a very heavy inquiry from the galvanizers, the market advanced from day to day and closes strong at 5.12½@5.17½c. New York, 4.97½@5.02½c. St. Louis.

Quotations for spelter in New York, May 13, were 5.05@5.07½c.; May 14 and 15, 5.07½@5.10c.; May 17, 5.10@5.12½c.; May 18, 5.12½@5.15c.; May 19, 5.12½@5.17½c.

The market in London is also higher, the closing quotations being cabled at £22 for good ordinaries, £22 5s. for specials.

Base price of sheet zinc is now 6½c. per lb., f.o.b. La Salle-Peru, Ill., less 8 per cent. discount.

Other Metals

Antimony—Business during the week has been quiet, with few sales. Prices are nominally unchanged at 8¼@8½c. for Cookson's; 7¾@8c. for U. S., and 7¼@7½c. for outside brands.

Aluminum—Quotations are 22@24c. per lb. base for No. 1 ingots in large lots; 31@32c. base for wire, and 33@34c. base for shorts. Business is steady, but not especially active.

Quicksilver—Business has been rather dull, but prices are steady. New York, \$44.50 per flask of 75 lb. San Francisco, \$44 for domestic and \$42 for export orders. London quotation is £8 7s. 6d. per flask, with 3s. 9d. less quoted by jobbers.

Nickel—Large lots, contract business, 40@50c. per lb. Retail, spot, from 50c. for 2000-lb. lots up to 55c. for 500-lb. lots. The price for electrolytic is 5c. higher.

Cadmium—Current quotation 75c. per lb., in 100-lb. lots, at Cleveland, Ohio.

Magnesium—Quotations for this metal are \$1.25 per lb., New York, in 100-lb. lots; for 5-lb. lots, \$1.40 per pound.

Spanish Metal Exports

Exports of metals and minerals from Spain in January, reported by *Revista Minera*, in metric tons:

Metals.	1908.	1909.	Changes.

Zinc and Lead Ore Markets

Joplin, Mo., May 15—The highest price reported paid for zinc was \$42 on a base price of \$39 per ton of 60-per cent. zinc, the highest grade ores bringing only a \$30 base against a \$39.50 to \$40 base price for 59 to 60 per cent. grades. The week was one of scattering prices; 300 tons of 60-per cent. ore sold on a \$37 base, 200 tons of 59 to 60 per cent. on a \$40 base, 150 tons sold on a \$39.50 base. The bulk of ore sold, however, on a \$38 to \$39 base. Silicate ores sold from \$17@20 per ton of 40-per cent. zinc. The average price, all grades, was \$35.90. Lead prices were again stronger, as high as \$57.50 being paid for this week's delivery, with \$60 bid for delivery early next week. The average price on this week's settlements, all grades, was \$55.84 per ton.

This spring has been one of exceptional outputting conditions, and the mines are

generally being operated to the full capacity, except those mines that cannot be operated on the present level of prices.

SHIPMENTS, WEEK ENDED MAY 15.

Year	\$36.63		\$34.51		\$53.95	

NOTE—Under zinc ore the first two columns give base prices for 60 per cent. zinc ore; the second two the average for all ores sold. Lead ore prices are the average for all ores sold.

Platteville, Wis., May 15—The highest price paid this week for zinc ore was \$40.50 per ton; the base price of 60 per cent. zinc declined from \$40 to \$39 per ton. For 80 per cent. lead ore \$54 per ton was paid; one car, 82 per cent., brought \$56 per ton. The week's shipment is the heaviest of the year; a large accumulated stock is beginning to move. Conditions are now ideal for outputting, after a backward spring, and a general resumption of activity is in evidence.

SHIPMENTS, WEEK ENDED MAY 15.

Camps.	Zinc ore, lb.	Lead ore, lb.	Sulphur ore, lb.
Platteville	961,930		158,900

Year to May 15	39,683,794	1,397,060	3,123,700

In addition to the above there was shipped to the American Zinc Ore Separating Company 600,490 lb., and to the Joplin Separator Works 258,000 lb. zinc concentrates.

Petroleum

May 19—Exports of mineral oils from the United States, four months ended April 30, in gallons:

	1908.	1909.
Crude petroleum	23,967,851	44,959,602
Naphthas	19,175,163	33,407,046
Illuminating oils	344,121,231	335,556,561
Lubricating oils	53,515,097	48,862,589
Residuum	14,784,172	32,601,010
Total	452,583,504	485,386,808

Paraffin is included in lubricating oils. The total increase this year was 32,803,304 gal., or 7.2 per cent.

Chemicals

New York, May 19—The market shows no considerable change. Deliveries on contracts are somewhat more active but current business is only moderate.

Copper Sulphate—Sales continue steady but not especially active. Current quotations are unchanged at \$4.22½ per 100 lb. for carload lots, and \$4.47½ per 100 lb. for smaller parcels.

Arsenic—Current quotations are unchanged at 27½@3c. per lb. for white arsenic. The sales for the week approximate 50 tons.

Nitrate of Soda—The market continues quite active, a good business being done at unchanged quotations, 2.15c. for spot and 2.12½c. for futures.

Mining Stocks

New York, May 19—The general mining-stock market has been much less active than during the preceding week. There was more or less recession of prices from the high levels then attained. This was not altogether due to profit taking, but seems to indicate that the bull movement had advanced farther than was really warranted by conditions. Trading, diminished in volume and the course of prices was rather irregular, a few stocks gaining while others lost. The close is quite uncertain, and it cannot be said that there is any decided tendency apparent.

Henry H. Rogers died this morning. The effect of his death on the market can hardly be gaged yet; but it must be remembered that he had not been specially active for two years past.

On the Curb trading was rather dull with some losses in quotations, especially in the copper stocks. These, however, were variable and for no apparent reason. Cobalt mining stocks continue in favor, and generally held their own pretty well. The Nevada gold stocks, however, were rather neglected.

Boston, May 18—The North Butte mining episode resulted in killing off an increasing interest in the market for min-

The Curb features have been in the higher grade of stocks. Helvetia made high at \$6.12½, assessment paid. Ohio Copper had good advance. Southwestern Development has been the most active feature, largely through newspaper advertising.

Industrials

John W. Freeman has been appointed manager of the Sprague Electric Company's Pittsburgh office to succeed F. W. Barry, who recently resigned.

Traylor Engineering Company, Allentown, Penn., advises having closed a contract with the Leeburg Mining Company, of Columbus, Neb., for a 30-stamp mill.

Smooth-On Manufacturing Company, Jersey City, N. J., has issued the third edition of its Smooth-On Instruction book No. 7 and will send a copy to any engineer on application.

The Wood Drill Works, of Paterson, N. J., has put in a stock of drills at Toronto, Ontario, Canada, at the showrooms of the A. T. Williams Machinery Company, which has branch offices in Winnipeg, Vancouver and Montreal.

The Carnegie Steel Company has added to the 1550-h.p. in Crocker-Wheeler form W motors in its Duquesne plant by the purchase of three more motors of the same type, especially designed for rolling-mill work, aggregating 225 h.p.

Tate, Jones & Co., Inc., Pittsburgh, Penn., has just received an order through the Erie City Iron Works from the Union Pacific Railway, at Omaha, Neb., for a complete all-burning equipment for use in connection with the Erie City "Economic" boilers.

The San Francisco branch office and warehouses of the Sullivan Machinery Company are now located at 461 Market street, in the Sheldon building, instead of at 26 Fremont street, as heretofore. Sullivan air compressors, diamond drills, rock drills and other mining machinery are carried in stock.

S. Morgan Smith Company, York, Penn., has opened an office at 644 American Trust building, Chicago. J. C. Temple, a well-known hydraulic engineer, who has been engaged in the water-wheel business for many years, has charge of this office and will be pleased to hear from people west of Pittsburgh who are contemplating installing turbine wheels.

S. B. Stine, Osceola Mills, Penn., has recently purchased the Osceola Foundry and Machine Company, formerly known as the J. J. McEstate, which has been in operation for some thirty or forty years. Interested parties will be pleased to learn that this plant is again in operation and that they can secure duplicate parts of the various machines which have been installed during this long period.

The Wood Drill Works, of Paterson, N. J., is distributing through the home office and United States representatives, Booklet H-29, entitled, "A Word With Thee," explaining the drilling methods used in constructing the South Scranton tunnel, the great dam of the Hollingsworth & Whitney Company, at Madison, Maine, and cuts of some of the undertakings in which the "Wood" rock drill figured prominently.

Alhorer Condenser Company 95 Liberty street, New York City, has issued catalog No. 13 pertaining in particular to Walworth water heaters. This covers the hot-water service heater as ordinarily used for domestic supply and swimming pools, also covers heaters for hot water heating system. The catalog will be found to be very interesting and contain information of value, and copies will be furnished upon application.

Frank Wells Hall has been appointed manager of the Philadelphia office of the Sprague Electric Company. Mr. Hall was formerly connected with the Sprague Electric Company, both in the New York and Chicago offices in engineering and sales capacities. His knowledge of the Sprague Electric products com-

bined with his wide circle of acquaintances and his extensive business and engineering experience will undoubtedly win for him a large clientele in his new territory. Mr. Hall assumed his new duties April 15, 1909.

The Shannon Engineering and Contracting Company are consulting engineers, devoted to modern appliances for handling all kinds of material. The company has been recently organized to engage in the manufacturing of complete industrial railways, cars of every description, cable and automatic railways, hoisting engines and other contractor's equipments. The organizers of this company are H. E. Mills and O. W. Scholz, having had over twenty years' experience in this particular class of work.

Fred M. Prescott Steam Pump Company, in order to facilitate the increasing demand for its product, has opened up another district sales office, at Atlanta, Ga. All business accruing in the southern and southeastern States will be handled directly from there. All inquirers will find the new office equipped with full engineering data, prices and information affecting any pumping machinery problem. The office is in charge of R. L. Radcliffe, who has been connected with the company's sales department for some time.

What might be called a pocket edition general catalog has just been gotten out by the Joseph Dixon Crucible Company, of Jersey City, N. J. This lists its principal products, such as crucibles, facings, lubricating graphite, greases, pencils, protective paint, etc., giving brief descriptions and prices. It is of value to the purchasing agent, engineer, contractor, superintendent, and anyone, in fact, who uses or speculates graphite in any form. The booklet is of commercial envelop size, and will conveniently go in the pocket or desk pigeonhole. It is substantially bound in tough cover stock, and attractively printed. A copy can be secured by writing direct to the company.

Elatelite roofing is not paper roofing, it is solid, reinforced, weather-resisting cement. It has been made for over ten years with a reinforced body of cement (the same principle is now being employed by modern builders, using reinforced concrete) this makes a strong and durable roofing. Elatelite roofing consists of a solid body of tough, pliable, noncrystallizing elatelite cement, which retains its properties throughout the long life of the roofing. The body of cement is reinforced with a heavy fabric center and saturated wool-felt back. The regular grades are finished with a top layer of mica and are as follows: 5X grade is reinforced with one layer of imported India burlap and weighs about 65 lb. per square, 4X grade is reinforced with one layer of imported India burlap and weighs about 55 lb. per square, 3X grade is reinforced with heavy muslin and weighs about 40 lb. per square. The whole Elatelite Roofing Company, Denver, Colo., will send full particulars on application.

Elmer & Amend have issued a new catalog entitled, "Calorimeters and Pyrometers." Under "Gas Calorimetry," full data of the Junker calorimeters for gas and liquid-fuel testing is given, these being the standard instruments of their kind in general use. Under "Solid Fuel Calorimetry," which has become such an important subject, due to the general movement toward buying coal strictly on its true heating value is given a short treatise on the sampling of coal (which is a most important element in the process of the determination of the heating value of fuel), also a working description of the Emerson fuel calorimeter. This instrument, which embraces all the latest features in calorimetry, is meeting with much favor, on account of its ease of operation, extreme accuracy and low cost. A brief description of the standard

Mahler and Atwater bombs is also given. Under "Pyrometry," special attention is directed to the Wanner optical pyrometers, which are the most accurately reading instruments for temperatures up to 7000 degrees. Also Fery radiation pyrometer and the new telephone resistance pyrometer, the latter instrument being low in price, simple of operation and very accurate.

The D'Oller Engineering Company has secured contract from the United States Government for a complete hydroelectric plant at Fort Yellowstone, Yellowstone National Park, including penstock and concrete power house. This installation will be used for furnishing light and power throughout Yellowstone Park and will consist of three 150-kw. alternating-current, 3-phase, 60-cycle generators, each direct connected to one 280-h.p. D'Oller Francis turbine water wheel operating under a head of, approximately, 275 ft. The water will be carried to the power house by a 26-in. steel penstock, which will be installed by the company and which will be provided with automatic-relief valves and large air chamber to aid in the regulation of the turbines, as the matter of regulation presents some difficulties, owing to the length of the penstock, this is, approximately, 2200 ft. A complete switchboard of the most modern type and transmission wiring are included in the contract. The turbines will be of the single-discharge type, with 22-in. runners mounted in cast-iron spiral flume on a horizontal shaft and discharging into the cast-iron quarter-turn fittings resting on cast-iron base plate. The wheels will be of government bronze and the swirl gates will be of manganese bronze of the D'Oller Engineering Company's latest swinging type. A flywheel is provided on each wheel with an effective flywheel effect of 6000 lb. The entire installation is of the most modern type, and it is expected that high efficiency and low maintenance expense will be secured.

You Can Save 80 Per Cent Breaking Rock Does This Interest You?

If you have a certain number of feet of rock to break, why should you pay \$50 for breaking it when you can break it in just as short a time for \$10 and with a plant that costs you two-thirds less money?

That's what the Deitz Airoelectric Rock Drill will do for you, and is doing every working day for many concerns now using it.

Perhaps you would like us to figure it out for you—give you more data so to speak.

Write us today and ask for Catalog A. It contains valuable Drill information for those interested.

Calumet and Hecla Drill-Sharpening Device

A Machine That Sharpens 3640 Drills Daily, Capacity of Which May Be Doubled. Electrical Counter Records Number of Drills Handled

B Y C. L. C. F I C H T E L *

The Calumet & Hecla Mining Company operates about 300 drilling machines, which necessitates the sharpening of approximately 4000 drills per day. The economical and efficient handling of these drills was the problem that confronted M. M. Morrison, who has direct charge of

equal if not superior in every respect to the old method of hand sharpening.

METHOD OF HANDLING

Owing to the location of the plant it was found impossible to afford railway facilities into the building; consequently it is necessary to haul the drills by team from

Each party of miners is held accountable for a certain number of drills, or an equivalent weight of steel; therefore it is necessary that each drill be returned to its original place. To accomplish this, each shaft is taken separately and a record made of the number and sizes of the drills

THE DRILL SHARPENING PLANT

all forgings and castings for the company, and it was through his efforts that the present system was worked out in detail. This installation is the most extensive and complete of any in the country and its operation is entirely satisfactory; sharpened drills are turned out in a manner

the various shafts. As the drills come from underground they are assorted according to lengths and placed in an iron box, or case, built especially for this purpose. Upon their arrival at the shop an electric crane lifts the case off the conveyance and places it in its allotted space beside the belt conveyer, shown in the accompanying plan.

as they are taken from the carrying case; when this number has passed through the machine and been restored to its place the next shaft is taken up.

METHOD OF SHARPENING AND FINISHING

As the drills are taken from their various cases they are placed upon a belt conveyer, which runs the full length of the

*Calumet, Mich.

building and travels at the rate of from 6 to 12 ft. per min., according to the rate of sharpening, the bit end of the drill facing the direction of motion. When the drill reaches the heating forge it is taken by hand from the belt and placed upon a chain conveyor, which carries it with a rotating motion through the heating forge, requiring about 3 min. to pass the heating portion. This forge is fed by crude oil under pressure and is heated to about 2000 deg. F. The drill leaving this conveyor falls onto a movable apron which, when lifted, allows the drill to slide into position in the sharpener.

SHARPENER

The sharpening machine reduces the end of the bit to a cutting edge and shifts the surplus metal from the center to the edges. It is operated by compressed air

UPSETTER

The functions of the upsetter are to restore the diameter of the drill and to back the cutting edges into a plane at right angles to the horizontal axis of the drill. This is accomplished by a few blows from an air cylinder, the piston of which carries the die. This cylinder strikes approximately 100 blows per min. on a 5-in. stroke, acting directly on the face of the drill. During this process the opposite end of the drill butts up against a rest and is securely held in position by a hand lever which grips it against stationary arms.

There are three of these rests, which necessarily must be adjustable to accommodate the various lengths of drill. They are staggered 120 deg. apart along an extended piston of a hydraulic cylinder; in this manner three different positions are obtained with an adjustment in each case

the length the smaller the cross-section of the sharpened end. The drill entering this machine is forced into position by a movable rest, acting upon the machine end. The rest travels on a slide and is controlled by means of a screw; this is actuated by friction cones belted to the driving shaft. The action of this screw through a worm gear also controls the opening between the dies, a travel of 1 ft. on the screw changing the opening $\frac{1}{8}$ in. When the drill has been placed in position, the clutch connecting the ram with the main shaft is thrown in and one complete revolution is made, forcing the dies together and reducing the ends of the drill accordingly. The drill is then turned half way and the two adjacent faces are treated in like manner.

The drill is now carried transversely on endless chains through the tempering

PLAN OF DRILL SHARPENING PLANT

at 65 lb. pressure, and consists primarily of a 5-lb. hammer in the form of a double die, striking 1600 blows per min. on a 4-in. stroke. When the drill falls into position from the heating forge it is clamped and held by the action of an air cylinder; this cylinder is operated by a foot lever, which also controls the throttle valve of the hammer.

The hammer mechanism is mounted on a sliding carriage controlled by a hand lever; this allows the device to work the metal from the heel of the bit to the edges and treats the opposite faces practically simultaneously. Upon the arrival of another drill from the forge the preceding one is released, and the lifting of the apron to allow the heated drill to come into the machine also causes the sharpened drill to fall upon a chain conveyor, which runs underneath this apron, and upon which it is carried to the next machine, the upsetter.

of nearly 24 in., the length of the cylinder. This cylinder is operated by oil under about 65 lb pressure, the pressure in the oil tanks being maintained by a retaining pump.

FLUTER

The drill next passes on to a fluter, which is an 800-lb. steam drop hammer, with a stationary die attached, acting upon a movable die. This straightens the vanes of the drill and reduces them to standard thicknesses. Two blows of the hammer are sufficient to accomplish this. The drill is then carried, in a manner similar to the connection between the sharpener and the upsetting machine, to the sizing machine.

SIZER

The sizing machine measures and reduces the drill to proper proportions, the diameter of a finished drill being commensurate to its length; that is, the greater

forge. In passing from the sizer to the forge the heated end of the drill passes through a hood about 4 ft. long, through which an air jet from a Sturtevant fan blows, cooling the drill below 600 deg. F. before it enters the tempering forge. This reduction in temperature is made so that when the drill passes through the forge it will not be heated beyond the required depth from the sharpened edge. This forge is a duplicate of the heating forge, with the exception that it is narrower, the drill taking about 2 min. in passing through it. As the drills leave the forge they drop into a tank containing cold water; here they are hardened and then are elevated by a chain conveyor to the under side of the conveyor belt on which they are returned to their respective places.

The number of drills passing through the machine are recorded by an electrically actuated counter, which operates as follows: When the drill passes a certain

point on its way to the heating forge it closes a contact, which operates a relay. The closing of this relay operates the alternating-current magnet coils, the armature of which is connected by a shaft to the arm of a reciprocating engine counter, and its pull lifts the arm against the tension of a spring. The alternating-current side of the apparatus consists of the reactive coil, a pair of magnet coils complete with armature and dashpot of a multiple-arc lamp, and is connected to the lighting circuit. The relay connection is made to

drills per day for a sharpener and helper as a good average by the hand method, it will be seen that a great saving is being effected.

Magnesite in India

In a paper on the Indian magnesite industry, read before the Society of Chemical Industry, H. H. Dains describes the work carried on at the principal deposits lying in the Chalk hills, near Salem, in the

calcining plant for the production of caustic and "dead-burned" magnesite has been erected near the quarries. The material ultimately finds employment in the manufacture of refractory bricks for basic furnaces, artificial stone, flooring, fireproof partitions, and many other stoneware productions.

The town of Vallecás, Spain, according to *Stone*, May, 1909, is built almost entirely of meerschaum. Vallecás has on its

HEATING FORGE, SHARPENER, UPSETTER AND WESTINGHOUSE AIR PUMP

DRILL CASES AND ARRANGEMENT FOR HANDLING

UPSETTER, SHARPENER AND HEATING FORGE

TEMPERING FORGE, SIZER AND FLUTER

avoid the grounding of the circuit on each stroke.

The compressed air used in the plant is furnished from the large central compressing plant. The shafting, conveyers, etc., are run by a 50-h.p. 2300-volt induction motor belted to the main drive. The installation includes two complete outfits as described and is treating at present 3640 drills daily, an average of three per minute per outfit. This can be increased to six per minute per machine if occasion demands. Considering 150

Madras presidency. The magnesite covers a superficial area of about 2000 acres and occurs in numerous irregular veins which ramify an ultrabasic intrusion of eruptive rock called dunite, a mineral consisting essentially of magnesium orthosilicate. Generally the magnesite is nearly white; it has a specific gravity of 3, and a hardness of about 5. Shipments of the mineral recently made show from 96 to 97 per cent. magnesium carbonate, with an exceptionally low content of lime, silica, alumina and oxide of iron. A modern

outsider's great quarries of meerschaum too coarse for pipe making, and a meerschaum-built town is the result. In Morocco meerschaum is so plentiful that they use it, when soft and fresh, for soap. It gives a plentiful and cleansing lather. Ekdischehr, in Asia Minor, supplies the world's meerschaum. There are 2000 mines, large and small, and 8000 Kurd and Persian meerschaum miners work day and night in them. This meerschaum comes from the earth yellow and turns white after 10 days' bleaching in the sun.

Suction Gas and Its Application to Mining

Prejudice against This Type of Power Generator Is Being Overcome.
Test of Plant Installed at Threlkeld Mines, Cumberland, England

BY GEORGE D. STEPHEN*

In no branch of applied science has the introduction of suction gas met with greater success than in modern mining practice. Mining men generally are somewhat prejudiced against power gas on account of its unreliability. In spite of this its popularity increases day by day, chiefly owing to its cheapness and efficiency. As regards reliability, there is no doubt that for small sizes, suction-gas engines and producers compare favorably with steam engines; for large sizes the balance of favor in this respect lies with the steam engine. This will be more apparent when the starting of large suction engines is discussed. For mining and quarrying purposes, suction-gas plants made by both English and Continental makers are to be found in almost every country in the world, performing different classes of work.

INSTALLATION IN CUMBERLAND, ENGLAND

The gas plant at Threlkeld mines, Cumberland, England, was built by Crossley Brothers. It consists of two generators and engines. Gas pipes are 10-in. diameter, fitted with stop valves so that one or both engines may work off either generator and convey the gas a distance of 20 to 30 ft. to the engines.

The engines, 100 h.p., are each directly coupled by a flexible coupling to 60-kw. direct-current generating sets, running at 200 r.p.m. in parallel, and supplying the same mains. The starting arrangement consists of a small pump by which petrol vapor is pumped into the engine cylinder and subsequently ignited. Scotch anthracite in the form of peas $\frac{1}{2}$ to 1 in., is used in the producer. The coal is fed into the producer by means of a storage hopper and feeder, from which it reaches the working level of the fire by gravitation; this arrangement causes the incandescent part of the fire to be constantly fed with warm dry fuel. The feeder and hopper are so designed that the fuel can be introduced into the furnace without at the same time introducing air.

THE PRODUCER

The producer, similar to the one shown in the accompanying illustration, consists of a cylindrical metal shell, with angle-iron stays and is lined on the inside with firebrick separated from the outside metal skin by a coating of sand. The fire-

brick lining rests on a metal ring supported on two cast-iron boxes, termed superheaters, placed at the hottest part of the fire and mounted on a flat plate carried right across the producer. The fire bars rest in a hole in the center of this plate. In this way a pit is formed immediately below the grate, and in this pit the steam and air used in gas making mix before passing together through the fire. The life of the firebrick lining depends upon the quality of the brick, but may be taken at about six or nine months. Around the cylindrical bell, defining the depth of the fuel in the producer, is the saturator or boiler *B*. In the bottom of the saturator, warm water is kept at a definite level by means of an overflow pipe *P*. The saturator takes the form of a flat dish extending to the outer shell of the generator, and has a series of baffle plates on its under surface which form passages, through which the hot gases pass, giving up heat to the water on their way to the scrubbers. This is the application of the principle of regeneration and accounts for the great economy effected, for it is clear that the requisite steam is raised in the saturator by extracting the heat from the gas as it passes from the fire to the coke scrubbers.

COURSE OF THE AIR

The air is admitted through what are known as the primary and secondary supplies. The primary air, which consists of air only, is admitted direct to the closed space under the fire grate by way of the starting fan. The secondary air, drawn through the air regulator, passes over the surface of the water in the saturator, absorbs water vapor, passes by way of vertical pipes (marked steam pipe in figure) embedded in the packing of the furnace, thence passing through superheaters to the closed chamber under the fire grate, where it is mixed with the primary air from the fan inlet before entering the fire. The gas is led off by a pipe *E* to the scrubbers, where it is cooled and washed before being used in the engine. A dust collector is sometimes interposed between the producer and the scrubbers, a pipe from the bottom of the collector carrying dust from the gas pipe into the water of the seal box *F*. A blowoff cock is fitted through which the inferior gas passes when starting up the generator.

The seal box also acts as a safety de-

vice, for, if an explosion were to take place, the water seal would blow out.

SCRUBBERS

The scrubbers consist of cylindrical vessels of wrought iron filled with coke, each provided on the top with a water spray; the water trickles through the coke, cools the gas, and increases its density and capacity for doing work. Two scrubbers are attached to each generator, for if the gas is not sufficiently cooled, water vapor is carried over into the gas mains, which usually gives a damp sparking plug. A sawdust scrubber is sometimes provided to remove any trace of tar from the gas, tar being objectionable for the continuous running of gas engines, as it clogs the valves and causes undue stoppage for cleaning.

WORKING ON LIGHT LOADS

One difficulty experienced when working on a light load is that the reduced number of strokes made with the gas valve open may not draw enough air to keep the fire in active condition so that full load may be thrown on at any time. To overcome this difficulty a bypass is fitted between the gas pipe and the mixing chamber so that during each suction stroke of the engine a small quantity of gas passes into the mixing chamber and a small quantity of air is drawn through the producer fire. This quantity of gas is not sufficient to form an explosive mixture and so the exhaust from the engine contains a small percentage of gas. This bypass is a very convenient arrangement, but for ordinary conditions prevailing at a mine, experience has shown that the coal consumption is considerably greater and in a few cases the device has been discarded. At the Threlkeld mine the suction-gas plant runs on a light load during the night, pumping water from a shaft and no difficulty is found in maintaining the quality of the gas when no bypass is fitted.

On a light load another difficulty must be overcome. When the governor cuts out a number of charges, steam continues to be generated which fills the steam space and causes the charge to be exceedingly inflammable. The fire is cooled by the production of this charge, and when the temporary richness has passed off, the gas produced at a lower temperature is of a poorer quality. In the Threlkeld plant this difficulty is surmounted by allowing

*Post Office box 2, Maralsburg, Transvaal.

the steam to escape at light loads through one or more cocks opening from the air-space in the saturator into the open air.

STARTING THE PLANT

After the fire is lighted, air is forced underneath the grate by means of a fan, worked by hand or a small motor; this air escapes through the blowoff valve. Blowing is continued for 15 or 20 minutes when the blowoff valve is closed and the gas tested at the engine test cocks; if it maintains itself alight, giving a long blue flame, it is of good quality for use in the cylinders. With a small engine a turn or two at the flywheel is usually sufficient to start it, but with larger sizes some other means must be adopted, such as the use of compressed air, petrol, etc.

At the Threlkeld mine some difficulty

As far as can be seen, it appears that the engine to be started must attain a certain piston speed before it can draw gas from the generator and this speed cannot be obtained by petrol, but by compressed air only, which is costly to obtain unless already in use at the mine. The management has, however, adopted a rather novel method of starting, by converting one of the d.c. dynamos into a motor until the required speed is obtained, when it is again converted into a generator. As the two compound-wound machines have to run in parallel and supply the same mains, a number of switches are required, which method introduces complications difficult to understand by unskilled labor and in this respect is disadvantageous. One point in favor of this method is that any defect in the spark-

winding will be a stepping stone to the extensive application of electricity and the general disuse of steam power. And it is by the introduction of suction gas or some form of power gas for the production of electricity that collieries and metal mines will benefit. Suction-gas plants seem to be well adapted for the development of metal mines in inaccessible districts, where water power is unavailable, and where the transport of a large supply of coal, such as is required by steam engines, is the determining factor between success and failure.

TEST PLANT AT THRELKELD MINE

The object of the test was to determine the coal consumption under the varying working loads, due to winding and pumping by electricity. The installation had been in commission almost a year at the time of the test.

After the klinkers were removed, the producer was filled up to the level of the hopper and at the end of the trial the klinkers were again removed and coal filled in to the predetermined level, so that complete accuracy was insured in measuring the fuel. The coal was weighed by a spring balance which was previously checked by standard weights. The gas engine was directly coupled by a flexible coupling to a d.c. 6-pole compound-wound dynamo of 60 kw. capacity at 200 revolutions per minute.

Following is a summary of the test:

Duration of test, 4 hours; total quantity of coal consumed, 250 lb.; average consumption of coal per hour, 62.5 lb.; average dynamo load in kw.-hours, 40.1; average h.p. of engine, 63.26; fuel per kw.-hour, 1.56 lb.; fuel per B.h.p.-hour, 0.986 lb.; cost of Scotch anthracite, 22s. per ton; cost of fuel per kw.-hour, 0.184d.; cost of fuel per B.h.p.-hour, 0.116d.; total klinker and ash, 25.5 lb.; efficiency of dynamo at two-thirds load, 85 per cent.

Thermal efficiencies:

$$\frac{\text{Electrical energy at terminals}}{\text{B.t.u. in fuel}} = 16.25 \text{ per cent.}$$

$$\frac{\text{B.h.p. energy}}{\text{B.t.u. in fuel}} = 19.2 \text{ per cent.}$$

Following is an analysis of a sample of Scotch anthracite used: Ash, 4.23 per cent.; moisture, 2.11 per cent.; volatile matter, 9.59 per cent.; fixed carbon, 84.07 per cent. The calorific value of this coal was 13,556 B.t.u. per pound, and 7531 calories per kilogram.

Crushed steel is used as an abrasive. It is produced by one concern only in the United States.

PRODUCER PLANT SIMILAR TO THE ONE INSTALLED AT THRELKELD MINES, CUMBERLAND

has been found in starting the engines. As no compressed air is available, petrol vapor is pumped into the engine cylinder and ignited. This gives the engine a "kick off," the gas is turned on at the engine and if the sparking arrangement is in good order, the engine invariably starts. Moisture in the gas pipes is a source of annoyance, as it destroys the regularity of the sparking, and it has been found advisable to adopt a high-tension pump spark for starting and, when well started, to use the magneto.

When working two engines off one generator the difficulty of starting the engine farther away from the producer is increased. The gas has to be shut off from one of the engines before the other can be started, and if the former is heavily loaded it soon slows down.

ing or in the working of the engine can be easily detected, while the engine is running without any gas.

FUEL CONSUMPTION

The guarantee made by most makers is, that under ordinary working conditions the full consumption, using anthracite coal, shall be under 1 lb. per b.h.p.-hour. Compared with a steam plant the cost of attending to a suction plant is small, as the generator is charged only every four hours; the time required to clear the fire and recharge occupies only five minutes. The "stand-by" loss for a suction plant is very much less than for a steam plant and for generation of electricity full load can be put on in a few minutes from a "stand-by" generator.

Perhaps the perfection of electrical

Freighting Ore with Big String Teams

By GEORGE C. MCFARLANE*

In no other section of the country is the art of driving horses and mules in long teams as well developed as in the outlying camps of southern California. The California practice could be imitated to advantage in many mining sections, where a long wagon haul is necessary to get in supplies and haul out ore and concentrates to the railroad.

At first the practice of freighting with big teams was confined to the comparatively level valley and desert sections, where it was not difficult to herd a long string of stock along the straight level roads. Gradually, however, the little details of handling the stock and fitting out the ore wagons and rigging have been perfected, until now 12- and up to 20-horse teams are worked by one driver on mountain roads, where an inexperienced driver might have difficulty in handling a team of fours.

HAULING BORAX IN VENTURA COUNTY

The borax haul from the mines in Ventura county to the railroad station at Bakersfield is a good example of cheap wagon transportation over difficult roads and under rather unfavorable conditions. From the mines on the south slope of Mt. Pinos to the railroad station is 65 miles by road. Leaving the mines the road follows through the foot-hills for 10 miles, then climbs the divide and skirts along the range to the head of the Tejon cañon, follows down the cañon to the San Joaquin valley, thence across 35 miles of sand and adobe plain to Bakersfield.

The freight rates over this road vary from \$10 to \$12 per ton for outgoing borate, and from \$6 to \$10 for incoming machinery and supplies. The freight rates vary with the price of hay and barley. In favorable years a good deal of feed is raised in the little mountain valleys along the road; in dry years the ranchers have no surplus to sell and all the feed must be hauled from the railroad station and distributed at way stations on the inbound trip. In laying out a road for this class of traffic considerable attention should be paid to curves, particularly where they are on steep grades; on straight stretches or on moderate curves, grades are not so important, as on heavy grades the driver can drop the trail wagons and pull them separately.

On fairly level stretches curves of 30 ft. radius are permissible. On these sharp curves the grade should be widened

to about 18 ft. so that the pointers of the team may have a chance to work. It is good policy to have most of the curves of over 200 ft. radius; then the driver can keep things moving without continually putting the pointers over the chain.

On the Ventura borax road few of the grades exceed 8 per cent., although there are two or three short stretches of 12 per cent. grade. The teams will handle the full load on grades up to 8 per cent.; when the grades are steeper than this the trails are dropped and the load pulled in two sections.

After heavy rains parts of the road get heavy; at times the big lead wagons will go down in an adobe mudhole and stick so hard that it takes 30 head of stock to pull it out. During three months of the rainy season proper no attempt is made to send out regular teams and most of the stock is turned out to pasture in the valley. Before the present depression in the borax trade about 500 head of stock were kept on the road hauling ore by the two mines in Ventura county. The teams ranged in size from 10 to 18 head; occasionally 20- and 22-horse teams were put over the road. Fourteen-animal teams seemed to have the best success on this road, larger teams requiring exceptionally skillful drivers to handle them on the sharp curves and heavy grades of the mountain section of the road. The stock used on this road is about equally divided between mules and horses; some of the teams are straight mule teams, others are all horses, while the greater number are mixed mule and horse teams. As a rule the mules are lighter than horses and will not pull as many pounds of ore as an equal number of horses; they require just as much feed in proportion to their size as a horse, but require less care and attention. Horses, on account of their size, make the best wheelers and generally make good line leaders; mules, however, work better as pointers, being very quick and nimble in skipping over the chain on curves.

A FREIGHT OUTFIT

A 14-animal freight outfit will consist of three wagons and a two-wheel feed cart, and will haul from 12 to 14 tons of ore; about 6 tons in the lead wagon, 4 tons in the first trailer, and 3 tons in the second. The lead wagon will have 2½-in. square steel axles, 7-in. tires and will be fitted with strong double brakes; the ore-bed being 2-in. plank strongly ironed. The sides are usually flashed with sheet iron and the bottom covered with dump boards laid crosswise. Through bolts run under the dump boards the full length of the box, and before any ore is loaded these bolts are tightened up to hold the dump boards close together to prevent the fines from sifting through. The running gear of a wagon of this size

will cost about \$300 and the ore bed \$75 to \$100. The trailers are smaller editions of the lead wagon and are fitted with single brakes, the lead wagon brakes being set with a long lever. A strap runs from this lever and is snapped to the saddle of the wheel horse, the brake being controlled entirely by the pull of the driver on the strap. The first trail-brake handle sets in a quadrant with a patent dog, and a small line runs from the handle of this brake to the driver. By pulling up on this line and quickly slacking off, the brake is set and dogged, by pulling up and slacking off slowly the brake is released. The hind trail-wagon brake is used only on heavy grades and in these cases the driver goes back and sets it just before the grade is reached. For convenience in coupling together the trail wagons are fitted with a short sliding draw-head; a horn or tail piece projects out about 2 ft. from the hind axle of the lead wagon to receive the draw-head. In going around a sharp curve this tail piece swings out laterally with the short tongue of the trailer and causes it to track the lead wagon instead of cutting across on a chord of the curve.

The draw chain consists of a number of eye-bars connected by short links, with slip shackles at every third stretcher. It is fastened to the hind axle of the lead wagon, passes through a stirrup under the front axle and a loop under the tongue. All the animals except the wheelers are hitched to stretchers attached to the draw chain. With a 14-animal team it would be necessary to have two or possibly three sets of pointers; the pointers are hitched on in front of the wheelers and are free to swing from side to side or jump across the chain. All the other pairs up to the leaders are hitched to the stretcher immediately in front of them; with them it is simply a game of follow the leader, and the only way they can get tangled up is by the leader's slacking up.

HANDLING THE TEAM

In handling the team the driver rides the left-hand wheeler, holding the brake strap over his left shoulder with the left hand and guiding the team with a jerk line held in the right hand. The two leaders are fastened together with a jockey stick and the line passes back from the bridle of the near leader through loops in the bridles of the swing animals to the driver, not being fastened to the pointers in any way. The line leader is guided more often by words than by the line; on gentle curves the outer pointers are called by name and they swing around sideways to the chain and single point. On sharp curves the pointers on the inside of the turn are put over the chain by flipping the jerk line over them, striking them on the side of the head

*Consulting engineer, 312 Bearinger building, Saginaw, Mich.

opposite to the way they are wanted to jump; as soon as they are over the chain the pointers pull off at an angle—on very sharp turns almost at right angles.

With three pairs of pointers working in this way, I saw a 16-horse team with three ore wagons and a feed cart turn around in a road 60 ft. wide. In making up a big team it is necessary to have a trained line leader and at least one set of well-broken pointers; the rest of the stock need not be accustomed to working in big teams. For the first couple of trips a green team will have to be loaded light and one or two swampers must be in attendance. The swampers club the pointers over the chain on the turns and handle the brakes on the bad turns and heavy grades. In two or three weeks a good driver will have the team trained so he can handle it alone.

Unlike the freighters in Montana and Idaho, who can turn the stock out at night to rustle most of their feed on the range, the borax haulers have to buy all feed, and instead of timothy and oats, they have to be satisfied with wheat, hay and barley, and pay big prices for it besides. Even with this handicap, they are wagon freighting cheaper than in any place in the country and the teamsters are paid the highest wages, i.e., \$100 a month and expenses and more. Even the big oil-burning traction engines have not been able as yet to freight as cheap as the long-line skimmers.

To get the best results, it is necessary to get the best wagons and equipment and keep them right up in shape all the time. As soon as the wagons and stock begin to run down, they must be replaced by new ones. In figuring out freighting costs, the companies consider that a freight outfit lasts four years, so that after an outfit was run two years it can be sold to ranchers for about half of its original cost. In general, all freighters figure on selling and trading their horses and wagons and getting new ones as often as possible, for it does not pay to keep a poor outfit on the road. For the same reason only the most careful and skilful teamsters are employed and once a man has established a reputation he can generally command his own price. The monthly expense of keeping a 14-horse team on the road averaged in 1907 about as follows: Wages of driver, \$100; board and road expenses of driver, \$35; shoeing the stock, \$32; wagon repairs, tire-setting, etc., \$25; feed (5 tons wheat hay at \$12), \$60; 4 tons of rolled barley at \$32, \$128; total, \$380.

A complete 14-animal freight outfit costs in California from \$3500 to \$4000, and since it lasts only four years, the monthly depreciation would be about \$80. This, added to the running expense, makes the total monthly cost \$460. On

an average the 14-animal teams hauled out 41.2 tons of borate ore and 6 tons of inbound freight, a total of 47.2 tons. This makes the actual cost of hauling a ton 65 miles, \$9.75.

A Balloon Survey

BY WALTER S. WEEKS*

The difficulty and inconvenience of measuring the height of the back in high stopes by means of swaying rods led me to try the use of balloons for that purpose. During the summer of 1908 the method was given a trial at the Harvard summer school of mining at South Stratford, Vt. The scheme was successful. The idea was to let the balloon, to which a thread was fastened, rise to the back of the stope and then to measure the length of the thread between the bottom of the balloon and the floor. This length plus the diameter of the balloon gave the height of the stope. The thread was measured by

SKETCH OF REEL, $2 \times A + \text{CIRCUMFERENCE OF WIRE} = 2 \text{ FEET}$

winding it upon a reel of known size, and counting the number of turns.

The following is a description of the outfit necessary for the work: The balloons are the ordinary toy variety costing 5c. each. They are purchased uninflated and are filled with hydrogen gas when they are to be used. The hydrogen gas can be obtained from dealers in chemicals. It costs 5c. per cu.ft. It can be purchased in cylinders holding 50 cu.ft. The gas in the cylinder is at such a pressure that it will easily inflate the balloons. The choice of the thread which holds the balloon is very important. One balloon will lift but a small amount of ordinary cotton string. The proper thread to use is No. 100 glacé thread. This is light and very strong. A well inflated balloon will lift 70 ft. of this thread.

The measuring reel is made of heavy wire. A convenient size for the reel is such that one complete turn is equal to 2 ft. A sketch of the reel is seen in the accompanying illustration. A reel with a spindle was tried but was found to be inferior to the simple reel shown. It is necessary to follow the course of the bal-

loon with a light of some sort. For this purpose a good acetylene bicycle lamp will answer. The round, shiny surface of the balloon catches and reflects the rays of the light so that the balloon can be seen when it is many feet in the air.

PREPARING AND HANDLING THE BALLOON

Stretch the neck of the balloon over the nozzle of the hydrogen cylinder. Hold the balloon securely while the gas is gently turned on. Inflate the balloon until it is about 10 in. in diameter. Tie a piece of soft cotton string about the neck of the balloon and remove it from the nozzle. Stretch the neck, double it back and tie again. Cut off all loose ends of the string to avoid weight. Fine thread cannot be used for securing the neck, as it cuts the rubber.

Attach the balloon to thread that is wound on the reel. Take the balloon beneath the back to be measured and allow it to ascend. When it has reached the back, unwind the thread until the reel can touch the floor directly beneath the balloon. Now hold the reel firmly in the left hand, and with the right pull down the balloon and wind up the thread, carefully counting the number of turns. The length of the thread plus the diameter of the balloon equals the height of the stope.

If the stope is windy, let the balloon up to the back and it will soon catch in some irregularity. Then walk under the balloon and measure. If the stope is inclined it will be found that the balloon will work up along the hanging wall. The dip of the thread can be taken with a clinometer and the slope distance converted into the vertical distance. By stretching a tape between survey station, and taking balloon measurements every few feet, an accurate contour of the back can be obtained.

Powder smoke should be blown out of the stope before any high measurements are attempted as the balloon can be seen only a short distance through the smoke. Lighted candles should be kept away from the balloon as the hydrogen explodes with some violence when ignited. Keep balloons as dry as possible as drops of water add weight.

Balloons will remain inflated about two hours. It is not worth while trying to reinflate them. If one balloon will not carry the thread to the required height, put on another one.

A new development in the alloying of aluminum with other metals (*The Metal Industry*, May, 1909) has just been accomplished by the production of "silverite." This metal is something entirely new and is composed of a mixture of aluminum, copper, zinc and steel in varying proportions according to the requirements. The resulting metal has a specific gravity of 3.1, a tensile strength of from 40,000 to 45,000 lb. per sq.in., and a compression resistance of 100,000 pounds.

*Assistant in mining and metallurgy, Harvard University, Cambridge, Mass.

Pyrite Smelting by Knudsen Method in Norway

When Sulphide Ore Is Roasted, Using Heavy Air Current, It Partially Melts, and Pure Metallic Sulphide Gathers on the Hearth

B Y E . K N U D S E N *

Much time and much money have been spent on the problem of pyrite smelting, and but slow progress has been made. This may partly have depended on the diversity of ore, necessitating different treatments; what is suitable for one ore may not be applicable for another. In the development of the Knudsen process at Sulitjelma, Norway, this was well observed, for experiments with very different ores were made during the course of the year and furnished a good guide.

OUTLINE OF METHOD

The Knudsen process depends on the fact that when sulphide ores are roasted under the influence of a powerful air current the ore melts partially, and the pure metallic sulphide flows out and gathers on the hearth of the furnace. The construction of the furnace is shown in Fig. 1. The idea is to accumulate a small bath of melted ore as soon as possible by means of the air blast; by the production of a strong oxidation in this bath a very high temperature is produced which then acts on the remainder of the charge.

The temperature attained in this process is so high that sulphide ore, even rich in silica, becomes entirely fluid. The tremendous heat, particularly in the last period of the concentration, renders it necessary to employ very thick linings of refractory material. The heat remaining in the furnace after the matte and the slag are removed is sufficient to kindle the new charge. The amount of coke or coal employed is very small, ranging from 0.5 to 1.5 per cent. of the weight of the ore, according to the nature of the latter. This quantity of coke is not particularly necessary for carrying out the process, but it serves to hinder the stiffening of the first, small, metal bath by the blast. The introduction of the air plays an important part in the process.

To charge the furnace, the estimated quantity of coke or coal is first introduced; this is then subjected to a strong air blast, whereby the fuel becomes red hot. The upper half of the furnace is connected with the hopper, which is then opened, and the charge falls into the furnace. The air blast is then maintained at a pressure of about 5 lb., the tuyere being well cleaned so that it does not form a nose. When the bath of melted

iron sulphide reaches the tuyere, the air pressure is increased to 10, 15 and even 22 lb. in some cases. In from 1½ to 2 hours, the whole charge is ordinarily melted and concentration begins; in from 3½ to 4 hours a matte is ready, containing from 40 to 50 per cent. of copper. The furnace is then tipped horizontally and the contents poured out into the forehearth.

EXPERIENCE AT SULITJELMA

It is now six years since the first experiments on a large scale were made at Sulitjelma and progress is slowly but surely being attained. At first a furnace of about 7 tons capacity was erected;

DURABILITY OF FURNACE.			
Run.	Magnesite Brick Used in Repairing Furnace.	Number of Charges.	Tonnage Smelted.
1	2,184	81	734.4
2	1,456	139	1,399.8
3	1,880	96	942.1
4	1,220	86	859.7
5	1,975	70	628.4
6	1,522	109	1,013.8
7	1,960	218	1,733.7
8	2,150	189	1,407.4
9	2,076	124	1,000.8

smaller furnace required for repairs approximately 1½ magnesite brick per ton of ore, the maintenance of the large furnace needed only one brick per ton. It is

FIG. 1. KUNDSEN FURNACE OF 8 TO 10 TONS CAPACITY

This represents the furnace as first constructed by the author. At present larger furnaces are used of a modified form which have been found more satisfactory.

then one to treat 10 to 12 tons, and finally one that had a capacity of from 15 to 20 tons. When I say 10 to 12 and 15 to 20 tons, the reason for this is that the ores are not of the same bulk, on which account it would be more correct to state the furnace size in terms of its interior volume, e.g., 6 cu.m. and 10 cu. meters.

The durability of the furnace can be seen in the following statement: The small furnace, in the period from Feb. 18, 1907, to April 9, 1908, made nine runs which, while they treated different tonnages, still showed an increasing duration.

The larger furnace generally gave a longer run, apparently in proportion to its capacity, and it required less repair. The big furnace permitted 170 to 202, and even up to 450 charges per run. While the

to be remarked that after removal the old brick were crushed and used for lining the hearth in the slag receptacle.

NATURE OF ORES SMELTED

The ores of Sulitjelma may be divided in two classes: Pure silicious ore and ore that is partially chloritized. The average analyses of each class are given in the accompanying table.

ANALYSES OF SULITJELMA ORES.

	Silicious.		Chloritized.	
Copper.	6.47%	6.45%	5.15%	5.11%
Iron.	32.74	32.90	25.64	27.10
Sulphur	33.87	39.90	22.64	25.30
Silica	16.73	16.20	31.38	26.30
Alumina	10.17	8.50	12.21	12.20

*General manager, Mitterberger Kupfer Aktiengesellschaft, Ausserfeld, Salzburg, Austria.

NOTE.—From advance sheets of "The Mineral Industry, Vol. XVI.

Our experience has shown that when a silicious ore is smelted, an easily fusible slag results, which, on being retained for about 20 min. in the horizontally placed furnace, gives a slag containing only from 0.5 to 0.6 per cent. copper. When, however, a large quantity of the chloritized ore is treated, the slag becomes thick and

Elmore slimes were mixed with 4 per cent. of milk of lime, pressed with a primitive ramming apparatus, and placed for 12 hours in a drying chamber. The briquettes were thereby rendered so firm that they withstood the hardest knocks, and did not fall apart when introduced into the Knudsen furnace. In $2\frac{1}{2}$ hours

We have smelted ores high in silica and low in sulphur and iron, for example, with 20 to 21 per cent. of sulphur, 32 per cent. of iron and 40 per cent. of silica. These ores smelted satisfactorily and gave a clean slag, but they were hard to kindle on account of the small amount of sulphur in them; this fact required the addition of 2 per cent. of coal and coke, but as soon as the bath of iron sulphide came in front of the tuyeres the oxidation of the iron furnished the necessary heat.

EXPERIMENTAL RESULTS

The composition of the matte during these experiments ranged from 45 to 56 per cent. copper, and the slags of a number of charges contained, respectively, amounts of copper and silica shown in the accompanying table. If the matte and slag be allowed to remain for a time on the hearth, and it has been indicated that a duration of 1 to $1\frac{1}{2}$ hours is best, the matte particles can then be successfully separated. It is advantageous to place some pulverized, pure silicious ore on the hearth in order to render the slag cleaner. It also has a good effect on the matte, which is sometimes produced too profusely if it has formed a crust on the walls, and for this reason has had to be tapped more slowly. A matte with 65 to 70 per cent. of copper might be obtained, which, however, is not well adapted for

COPPER-BESSEMERIZING

must be held for a longer time in order to separate completely the particles of matte blown into it by the blast. For this purpose a forehearth is provided into which the charge is poured and allowed to remain for about 90 min., after which the slag is run off and granulated while the matte is tapped into a Manhés converter.

Certain other ores had the disadvantage of decrepitating, which caused the charge to fall into a more or less powdery state, and then fuse together. If a considerable part of the charge should then fall into the molten bath at once, sharp explosions would occur, which, to the uninitiated, would seem dangerous; the only damage, however, was the freezing of the bath, if the falling mass of charge were too large. Whenever this accident occurred, we would tip the furnace to the horizontal and put a few kilograms of coke and 200 to 400 kg. of crude ore in range of the tuyeres; on replacing the furnace vertically and turning on the blast, the charge would again become normal. We have, in fact, smelted charges consisting of one-third lump ore, one-third fine ore and one-third dust, with success, but when so much fine material is introduced into the furnace the charge is bound to sinter somewhat.

We also experimented with slimes from the Elmore vacuum process, briquetted for smelting, with excellent results. The

THE KNUDSEN FURNACE (20 TONS) DURING THE SMELTING OF THE CHARGE

of smelting a matte was obtained with 38.5 per cent. copper. When much fine ore has to be treated, it is best to divide it, taking the smaller portion to make into briquettes, drying but not burning them, before putting them into the furnace. This insures a quiet operation without unpleasant disturbances.

the Manhés converter; by adding this raw ore, the copper contents can be brought down to 55 or 60 per cent., which can then be bessemerized very well.

COMPOSITION OF THE SLAG

As previously stated, the fluidity of the slag is the deciding factor. With a well-

acting furnace and with ores giving an easily fusible slag, no forehearth was found to be necessary. But in metallurgical processes things so often take place unexpectedly, that I do not consider it advisable to work without the forehearth.

fragments of the brick from the lower part of the furnace are used partly for repairing the upper part when necessary (which is not often), and some are broken up for lining the forehearth. Magnesite is especially necessary for the lower

the next 1 to 1½ hours, 80 to 100 h.p., and in the last hour of the blast, 150 to 160 h.p., and in a few rare cases, 200 h.p. A furnace of 12 cu.m. capacity treats 20 to 25 tons of ore, and inasmuch as at least four charges in 24 hours can be reckoned, the power required is not large per ton of ore smelted, particularly as a pause of about 1 hour takes place between every two charges, for cleaning the furnace and burning the coke and coal, when practically no power is consumed. Having steam facilities, the feed water can profitably be warmed by gases given off from the furnace, as I have practically demonstrated.

SLAG ANALYSES.

0.49	37.68	0.38	35.35	0.65	32.56		

The slags at Sulitjelma are commonly monosilicates, with from 28 to 32 per cent. silica, 56 to 59 per cent. iron oxide, 10 to 12 per cent. of alumina, about 1.5 per cent. sulphur, and from 0.3 to 0.6 per cent. of copper.

Experiments were made by allowing the slag to flow into large iron pots, and fine results were obtained for a day at a time, until suddenly the slag would become thicker, and the separation of matte particles would be incomplete. Such surprises do not occur in a forehearth heated by generator gas. I have observed that slags with 32 to 36 per cent. silica carry the least amount of copper. We have had slags that, on being granulated, contained only 0.29 per cent., but ordinarily they varied from 0.4 to 0.6 per cent. in copper.

COMPOSITION OF THE MATTE

The matte ordinarily produced at Sulitjelma has a copper content of 50 to 55 per cent. and contains 20 to 21 per cent. of sulphur. After tapping into the converter, the first hour's treatment produces a copper 99.25 to 99.5 per cent. pure. The copper contains some silver.

The greatest difficulty of the process, when conducted in a small furnace, is to secure a matte which shall not vary too widely from the average. Wall accretions are more likely to occur, involving a longer blowing; and, thereby, a richer matte unsuited for the Manhés converter. With a large furnace, this last difficulty is less pronounced since the charge sinks regularly and permits the formation of a matte with any desired copper content. With charges low in iron, it is important not to blow too long, making a matte high in copper, since there is danger of freezing the charge.

When the charge has been sufficiently blown, the furnace is emptied at once, and after a few minutes the matte runs into the converter. We have often made a finished bessemer copper within 5 hours after charging the furnace, and sometimes within 4½ hours.

LINING OF THE FURNACE

The durability of the lining depends altogether on its construction. The magnesite brick must be closely united, so that the joints are reduced to a minimum, and special mortar must be used. The

part of the furnace, up to 1.25 m. above the tuyere. It is the back of the furnace that suffers most. We have, for example, repaired the large furnace twice, above the tuyere, with 600 to 800 brick, and with these two small repairs have smelted 9000 tons of ore. The magnesite

WASTE GASES

The gases given off in the beginning of the process are not very hot, but they

GRANULATING THE SLAG

mortar is mixed with tar and applied very warm.

AIR BLAST

The blast pressure is variable, ranging from ¼ to 1 atmosphere, and often to 1 1/3 to 1½ atmosphere. A good deal depends on this as to how the charge starts. When care is exercised in the beginning, and not too much air is given during the first hour, a charge will generally settle down in a regular manner, and will then work well with a pressure of one atmosphere. When the charge hangs back and crusts are formed, it is necessary to use a higher pressure, whereby the melted bath is strongly agitated and the crusts go into solution.

The power necessary for blowing a Knudsen furnace, of about 12 cu.m. capacity, is as follows: In the first 1½ hours, not far from 40 h.p. is needed; in

soon increase in temperature; at a distance of 10 m. from the mouth of the furnace, we have measured, with a pyrometer, temperatures of 600 to 780 deg. C., toward the end of the process. The radiation from the lining of the furnace, after it has been emptied and again set upright, is so great that we have measured 180 deg. in the outlet channel distant 10 m. from the mouth of the furnace.

The percentage of sulphurous acid in the gas has often been determined. From the nature of the process, the percentage is somewhat variable, but the gases from a charge show an average between 6 and 7 per cent., by volume, of SO₂ + SO₃. The amount has been determined to be from 2½ to 11½ per cent. by volume, and was, in the last instance, 9 to 9½ per cent. dioxide and about 2 to 2½ per cent. trioxide.

FUEL

The coke and coal consumption depend on the cross-section of the lower part of the furnace, and not on the size of the charge. Thus if a 20-ton furnace be charged with only 12 or 14 tons, the same amount of coke must be used as though it were filled with 20 tons. As previously stated, with ores difficult to kindle the coke consumption rises to 2 per cent., while ordinarily it is less than 1 per cent.

For a charge of from 20 to 25 tons, there are required, per ton: 0.1 ton of coke; 0.1 ton of coal; 15 pieces of magnesite brick, to repair the furnace; and 20 pennings (5c.) worth of tools, tar, etc. The heating of the forehearth also requires, per 24 hours, about $2\frac{1}{4}$ tons coal and $\frac{1}{4}$ ton wood. It is to be noted

for the Knudsen furnaces, and 0.70 mark (17c.) per ton for the management of the forehearth. Air compression is reckoned in, as are the chief repairs that are occasionally necessary to the hearth and the furnaces. In this statement, wages are reckoned at 5 and 4 marks per shift and the coke at 35 marks per 1000 kg., coal at 20 marks per 1000 kg., and magnesite bricks at 1 mark apiece.

It has been thoroughly proved that in the Knudsen process the loss of copper is less than in the former process of roasting and smelting of roasted ores in water jackets. This copper loss has been reduced by about 45 per cent. The smelter report, covering a run at Sulitjelma of over 115 charges, from Sept. 26 to Oct. 31, 1908, furnishes the following data: The ore charges varied from 8.3 to 15.4 tons,

of ore were smelted, and all of this in Knudsen furnaces. The cost was as follows, in Norwegian crowns (\$0.27) per ton: Unloading, transportation and carrying of the ore, coke, etc., into the works, 0.73; lining the Knudsen furnaces, 1.69; smelting (including air compression), 1.48; repairs, etc., 0.48; total, 4.38. For 1908 the cost of smelting appeared to be less.

As previously explained, the small furnace is uneconomical, for it requires the same attendance as the large one, and the amount of combustible material is about the same. It is therefore advantageous to use the larger furnace and to connect two of them to one hearth, thus insuring a cheaper production per ton of smelted ore. Experiments on the smelting of pyrrhotite ores containing nickel are well under way; copper ores, also, containing zinc blende have been smelted to a matte without difficulty, and with good results.

THE MATTE IS TAPPED INTO MANHES CONVERTER

that one forehearth is sufficient for two or even for three Knudsen furnaces.

LABOR EMPLOYED

The running of the Knudsen furnace requires two men per shift. These can attend to the charging, smelting, pouring out and also the cleaning. It is their duty to see that the charge is placed in the hopper over the furnace, ready for use, and that the coke and coal are on the grates. A foreman can easily look after two or three Knudsen furnaces. The generator and the forehearth can also be attended by two men per shift.

COST OF OPERATION

The cost of smelting with a plant of two furnaces of 20 tons each, and one forehearth, with a generator, at normal prices for labor and materials, is about three marks (74c.) per ton of ore smelted,

but were chiefly from 12 to 14 tons. The coke and coal used was 0.2 ton in practically every charge. The time required was from 2 hours, 35 min., to 6 hours, with an average in the neighborhood of 4 hours. In every case the charge stood for $1\frac{1}{2}$ hours in the forehearth. In practically every case 0.5 ton of Elmore slimes was charged in the hearth. The copper in the slag from hearth ranged from 0.4 to 0.66 per cent. Copper in the matte ranged from 34.4 to 73.3 per cent. The majority ran from 40 to 60 per cent. The generators required from 2 to 2.5 tons of coal and from 0.25 to 0.35 tons of wood per charge.

During the last three years, all smelting ores in Sulitjelma have been treated in Knudsen furnaces. The rich slags, however, were smelted in a water jacket, but this practice will be discontinued. During 1907, at Sulitjelma, 10,141 tons

In selling iron and steel, says the *Cleveland Iron Trade Review*, the net ton—of 2000 lb.—is the most generally used, and where such is the case, basing quotations are on one or 100-lb. quantities, as for instance, 1.30c. Pittsburgh per lb., or \$1.30 per 100 lb. on plates, 1.15c. or \$1.15 Pittsburgh, on steel bars, etc. Most of the finished lines including plates, sheets, skelp, merchant bars, hoops, bands, shapes, tubular goods, wire, nails, etc., are sold at net tons. In tinplate the basing prices are on the 100-lb. box and in cotton ties, on the bundle. Fixed ton prices are the rule where products are sold on the 2240-lb. or gross-ton basis, which is the case with semi-finished steel, such as billets, sheet-bars, slabs, wire-rods, etc., muckbar and old material. Scrap, however, is sometimes sold by net tons and skelp is sometimes dealt in at gross tons. Rails are about the only finished product to which the gross ton applies.

The iron-ore deposits of the Briey basin in France were first opened in 1898. The first shipments were made in 1899, amounting to 102,131 metric tons. In 1905 the shipments reached 2,352,848 tons, and in 1908 they were 4,580,223 tons. The Briey ores are similar to the minette ores of Luxemburg. They average about 35 per cent. metallic iron and carry lime enough to make them self-fluxing. The percentage of phosphorus is too high for pig iron made from them to be used in the acid-steel process, but they make excellent basic pig.

Russian platinum exports in 1908 (*Chem. Trade Journ.*, April 17, 1909) amounted to 321 poods, valued at 9,658,000 rubles, as compared with 298 poods, valued at 6,930,000 rubles in 1907.

The Coal Dust Question in Great Britain

Reviewing Efforts of the Early Investigators, and Showing How Present Legislation Has Reduced the Number of Gas and Dust Explosions

B Y H E N R Y H A L L *

Notwithstanding the many practical demonstrations showing the explosive force of coal dust, the mining world has been very slow to acknowledge and accept the position as one that positively demands a radical change of existing methods of mining. For a period extending over 60 years, from about 1845 to the present time, many scientific experimenters have endeavored to convince practical miners that fine coal dust was as much to be dreaded and guarded against as firedamp itself, but it is only during the last 10 or 15 years that this view has become so generally accepted by those responsible for the safety of the workers in coal mines.

The earliest experimenters were content to point out that coal dust (dusty roads) augmented the force and intensity of firedamp explosions. Professor Faraday lecturing at the Royal Institution on the circumstance of an explosion at Haswell colliery in 1844, expressed his opinion of the disaster in the following words: "The ignition and explosion of the firedamp mixture would raise and then kindle the coal dust which is always pervading the passages, and these effects must in a moment have made that part of the mine which was the scene of the calamity, glow like a furnace."

In the same lecture, the following interesting paragraph appears, forecasting nearly the whole of the phenomena since proved to be actual and true: "In considering the extent of the fire from the moment of the explosion, it is not to be supposed that firedamp was its only fuel; the coal dust swept by the rush of wind and flame from the floor, roof and walls of the works would instantly take fire and burn if there were oxygen enough present in the air to support its combustion; we found the dust adhering to the faces of the pillars, props and walls, in the direction of and on the side toward the explosion, increasing gradually to a certain distance as we neared the place of ignition. This deposit was in some parts half an inch thick, in others almost an inch thick; it adhered together in a friable coked state. When examined chemically and compared with the powdered coal, it was found deprived of the greater proportion of the bitumen, and in some instances entirely destitute of it. There is every reason to believe that much coal gas was made from this dust, in the very air itself in the mine, by the flame of the

firedamp which raised and swept it along, and much of the carbon of this dust remained unburned only from want of air."

COAL DUST WAS NOT CONSIDERED IN ITSELF EXPLOSIVE

This description of a coal-mine explosion in 1844 is quite consistent with the later knowledge gained on the subject, except that it takes no account of the fact, now established, that coal dust and air in certain proportions are capable of being exploded, and causing a disaster in the

tively high, then the dust question became a serious one. In mines of this character, fine dry coal dust accumulated from day to day and was strewn by the traffic and ventilating currents throughout the whole of the galleries, adhering to, and remaining as a coating or covering on all projecting parts, and where no steps were taken for its removal, I have frequently seen it lying 6 or 8 in. thick along the sides of the main roads for considerable distances, while the lighter and finer particles were deposited in a substantial

A COAL-DUST EXPLOSION IN THE EXPERIMENTAL SHAFT IN LANCASHIRE

entire absence of firedamp. In 1844 and for several years afterward the part played by coal dust was held to be a simple aggravation of the firedamp explosion, merely adding fuel to the flame, an irresistible and natural conclusion, in the absence of knowledge of its explosive qualities.

During this period the coal mines were generally of no great depth, surface water percolating and keeping the stratifications wet, and any dust raised in the operation of coal-getting quickly became damp and innocuous. When deeper and dry seams had to be opened up, where in consequence of the greater depth the natural temperature of the strata was compara-

layer on both roof and sides. Passing along such roads, the sensation is that of walking on a velvet carpet. In an extended interval of time, there must be thousands of tons of this combustible material lying ready to be licked up by a passing firedamp explosion, or itself exploded in the absence of any firedamp by a blown out gunpowder shot.

This was the normal condition of the majority of British coal mines in 1872 and is still the condition of a large number in districts where the coal seams are soft and friable and the underground temperature high. It is remarkable that in the British act of Parliament for the

*H. M. Inspector of Mines, Rainhill, Lancashire, England.

regulation of mines passed in 1872, no reference whatsoever is made to coal dust; indeed the word does not occur anywhere in the act. I mention this to show that the coal-dust question did not begin to assume any great importance until subsequent to that date, and no attempt had yet been made to alter or mitigate a condition of things which was generally prevalent in all the deeper mines in the Kingdom.

EXPLOSIONS KILLED 4098 PERSONS

Great colliery disasters attributed to the presence of firedamp continued to be of frequent occurrence. From the beginning of 1873 to the end of 1892, 4098 persons lost their lives in British coal mines by explosions, and the evidence given at the formal investigations of the circumstances of several of these accidents made it impossible to assign them to the agency of firedamp alone; their magnitude and extension throughout many miles of underground roadways could not be adequately explained on the firedamp theory alone. For some years it was the fashion to try to account for the immense development of force in colliery explosions, on the assumption that a sudden and unforeseen outburst of firedamp had occurred, inundating with explosive atmosphere more or less the whole area of the mine, or in other words that the occurrence was due to an "act of God." This theory failed to hold the field for long because there was an entire absence of any evidence of such a state of things existing, either immediately before, or after the event.

About the year 1875, William Galloway of Cardiff, who at that time held the position of a government inspector of mines, drew attention to the important part played by coal dust in so-called firedamp explosions. This gentleman pursued his inquiries and carried out many experiments and became an able and strenuous advocate of what has been termed "the coal-dust theory."

In a paper read before the Royal Society in 1876, Mr. Galloway stated: "A mixture of firedamp and air, in the proportion of one volume of the former to 112 of the latter, becomes inflammable at ordinary pressure and temperature, when charged with fine dry coal dust, such as that which is to be found on the roadways in dry coal mines."

This conclusion of Mr. Galloway's was confirmed by an elaborate series of experiments carried out under the direction of Sir Frederick Abel, assisted by Mr. Smethurst at a colliery near Wigan at the instance of a royal commission on mine accidents then sitting, and of which body Sir Frederick was a member. I witnessed many of these experiments and although they proved that an atmosphere contaminated with 2 per cent. of firedamp became explosive when it was mixed or carburetted with fine dry coal dust, the experiments were on so small a scale

that the more important question, as to whether coal dust and air in the absence of firedamp was explosive was left untouched. The conclusion arrived at by Messrs. Abel and Smethurst is set forth in the following extract from their report:

"Some of these dusts when thickly suspended in air traveling at the velocity of 500 to 1000 ft. per min., and exposed to the action of a large flash of flame, as is produced by gun cotton and blasting powder, exhibited a tendency not only to burn explosively in, or close around the flame, but also to propagate flame or cause it to travel along some distance; but the most decisive of the results were not of a nature to warrant the conclusion that flame could be carried along to a very great distance by coal dust in the complete absence of firedamp."

It is not to be wondered at, that a rapidly moving atmosphere made up of air containing 2 per cent. of methane, and intimately mixed with fine dry coal dust should be capable of being inflamed and burned with explosive violence by the intrusion of the flash and shock of a blown-out gunpowder shot, and it is clear that an atmosphere such as this, must frequently exist in parts of dry and dusty mines, where every freshly exposed coal face is constantly exuding firedamp.

SOME OF THE EARLIER EXPERIMENTS

Every great disaster as it occurred gave rise to greater interest in the subject of coal dust and scientists renewed their endeavors to elucidate further the phenomena of colliery explosions. Experimental galleries were installed at considerable cost in Germany, France and England. The German experiments were carried out at Saarbrücken in 1884 by the Prussian Firedamp Commission. At the suggestion, and under the direction of Mr. Hill, one of its members, the gallery used was about 170 ft. long, with a sectional area of 22 ft. In one series of the experiments, dust and firedamp were used; in the second series, dust alone. Mr. Hill submitted certain conclusions as the result of these tests; among others of a less definite character, we find:

"1. The presence of coal dust in more or less abundance in the immediate vicinity of the working face, gives rise to more or less considerable elongation of the flame projected by a blown-out shot, whether small quantities of firedamp be present in the air or not.

"2a. In the complete absence of firedamp the elongation or propagation of flame is generally of a limited extent, however far the deposits of dust may extend in the mine ways.

"b. There are, however, certain descriptions of coal dust, which if ignited by a blown-out shot, will not only continue to carry on the flame, even to distances extending considerably beyond the confines of the dust deposits, but will also give rise to explosive phenomena, in the com-

plete absence of any trace of firedamp, which, in character and effects are similar to those produced with some other dusts in air containing 7 per cent. of firedamp."

In France in 1882, M. M. Mallard and Le Chatelier published the results of their inquiries into the part played by coal dust in mine accidents. Their researches seem to have led them to conclusions opposed in important respects to those of previous experimenters. They confidently maintained that no coal-mine accident of any importance could be attributed, even with some claim to probability, to the action of coal dust. They also maintained that all explosions of magnitude which have been solely attributed to coal dust have occurred in mines in which firedamp occurs; that the possibility of coal dust *per se* giving rise to an important explosion, could only be established by the occurrence of an explosion in a mine in which the total absence of firedamp could be absolutely demonstrated, and that the impossibility of dust alone giving rise to extensive explosions is demonstrated by the fact that lignite mines, which are generally very dusty, the dust being extremely inflammable, but which are at the same time almost free from firedamp, have never yet been visited by accidents of this class.

In England, a royal commission on accidents in mines (the late Sir Warrington Smythe was chairman) sat from 1876 to 1886, and in a report of the latter date, the commissioners stated: "The following facts relating to the part played by dust in coal-mine explosions may now be regarded as conclusively established.

"1. The occurrence of a blown-out shot in working places where highly inflammable coal dust exists in great abundance, may, even in the total absence of firedamp, possibly give rise to violent explosions, or may at any rate be followed by the propagation of flame through considerable areas, and even by the communication of flame to distant parts of the workings where explosive gas mixtures, or dust deposits in association with non-explosive gas mixtures, exist.

"2. The occurrence of a blown-out shot in localities where only small proportions of firedamp exist in the air, in the presence of even comparatively slightly inflammable, or actually non-inflammable but very fine, dry, and porous dusts, may give rise to explosions, the flame from which may reach to distant localities where either gas accumulations or deposits of inflammable coal dust may be inflamed, and may extend the disastrous results to other regions."

The commissioners made the following suggestions for guarding against the danger of blasting in dusty mines:

"1. The removal of dust as completely as possible from the working places.

"2. The provision and thoroughly efficient adoption of simple and effectual

measures for rendering dust innocuous in the presence of a blown-out shot.

"3. The discovery of means for preventing the possible occurrence of blown-out shots.

"4. The adoption of particular agents or of particular methods of using such agents, which deprive a blown-out shot of its danger by insuring the total absence of flame, or of highly heated solid matter when the shot is fired.

"5. The substitution for explosive agents, of similarly efficient methods of bringing down coal and stone which are quite free from the special dangers attending the use of those agents."

These extracts from the various reports, both British and foreign, exhibit only a half-hearted acceptance of the "coal-dust theory" and did not by any means press home the urgency of immediate action; however, the following British act of Parliament for the regulation of mines (1887) did enact certain precautionary measures to be observed in dusty mines as follows: "If the place where a shot is to be fired is dry and dusty, then the shot shall not be fired unless one of the following conditions is observed, that is to say:

"1. Unless the place of firing and all contiguous accessible places within a radius of 20 yd. are at the time of firing in a wet state from thorough watering or other treatment equivalent to watering, in all parts where dust is lodged whether roof, floor or sides, or

"2. In the case of places in which watering would injure the roof or floor, unless the explosive is so used with water or other contrivance as to prevent it from inflaming gas or dust, or is of such a nature that it cannot inflame gas or dust."

Interest in the subject did not cease with this official recognition of the danger to be apprehended from the presence of dry coal dust and great explosions continued to occur from time to time in spite of these new regulations. Messrs Galloway, W. N. Atkinson, J. B. Atkinson, and myself continued our efforts, in and out of season, to convince mine owners and managers of the great risk there was in using ordinary gunpowder for blasting in dry mines. About this time, explosive agents of an entirely different character from gunpowder notably roborite, bellite, etc., began to be introduced and used in some of the mines in Lancashire and elsewhere. I was impressed with the immense difference in the behavior of these new explosives as compared with that of gunpowder; this can be simply and easily demonstrated by placing a charge under a small heap of coal dust; in the case of gunpowder, there is an immense development of flame rising high in the air and consuming the dust, while flame is entirely absent when the charge is made up of the newer explosives.

It was plainly evident that salvation lay in this direction, not only because we now

possessed an explosive agent, developing on ignition noncombustible gases, but also, what is equally important, of a nature so rapid in action that the occurrence of the dreaded blown-out shot was almost an impossibility. That much greater security against explosions of gas or dust would be secured by the substitution of the newer explosives for ordinary gunpowder was self-evident, but how to bring this home to those operating the mines was not so easy. Experimental galleries and scientific treatises failed to impress those with whom the power rested to change existing methods. At this time, I commenced a series of experiments in a disused colliery shaft 150 ft. deep, with quite simple accessories, believing that an object lesson on a large scale, the scene being an actual mine, would appeal more directly to practical miners than elaborate and more artificial experiments.

A PRACTICAL OBJECT LESSON

The first step to be taken was to make this pit shaft represent as nearly as possible a dry, dusty underground road; with this object in view, ledges of timber were fixed at varying intervals in the shaft, to form resting places for dust, as would be the case in a timbered underground road. When these fittings had been completed and the shaft ready for use, about 2 cwt. of fine coal dust was thrown down the shaft the bulk of which fell to the bottom and went out of action; consequently, only a thin coating of dust was left adhering to the sides of the shaft and to the timbers, ready for action. An iron cannon charged with $\frac{3}{4}$ lb. of ordinary blasting powder was lowered to the bottom of the shaft and when all was ready the cannon was fired vertically upward by means of an electric battery. A series of six tests was made; at the second trial, the dust was exploded and in an official report dated October, 1890, the phenomenon is described as follows:

"Dust was ignited and a violent explosion took place in the shaft; a large body of flame rushed out of the mouth of the pit, setting the woodwork on fire on the surface and ascending into the air about 20 ft." A note is added: "The electric firing cable was burnt and destroyed and the experiments had to be discontinued." The series of tests were resumed a month later, the dust used being in a blend of highly bituminous coal (Arley seam) from two separate collieries. There were four trials, the dust being allowed to settle in the shaft over a period varying from 20 min. to 2 hours; an explosion of dust resulted in each of the three trials, where gunpowder was the explosive, but at the fourth test, the cannon being charged with 4 oz. of roborite, there was no explosion of the dust. After No. 1 test, the charge of gunpowder was increased to 1 lb., a weight of charge below those frequently used for blasting

coal. The last experiment of the series caused the most violent explosion of all, probably due to the shaft which was naturally damp being warmed and dried by the previous explosion.

The scene of operations was now changed to a pit shaft in course of sinking, described as follows: "Depth of pit, 390 ft., diameter, 18 ft." This pit was in course of sinking and was connected with another sinking pit close by, by means of a cut-through in a coal seam at a depth of 300 ft. The cannon was fixed on a scaffold at this latter depth. The shaft sides were wet and dripping and the lower part of the pit, below the scaffold, was full of water. A coke fire was placed on the scaffold causing the experimental pit to act as an upcast, the current of air passing being only at the rate of 30 ft. per min. Weather fine, temperature at surface 68 deg. F. A series of six tests was completed, and although as they proceeded, heavier charges of explosive and more dust were used, in no case was there an ignition of the dust. The cause of this is by no means clear; probably the chief factors were the wet condition of the shaft and its large dimensions (18 ft. diameter).

It has been found that a contracted experimental tube, charged with an explosive atmosphere, is exploded more readily than one of larger dimensions (see official tests for flameless explosives in Germany and elsewhere). I believe that at least three conditions are necessary for the initiation of a coal-dust explosion, viz., a large hot flame in close contact with the dust; rapid vibration of the atmosphere from shock, and a brisk supply of ventilation to continue and develop the primary ignition.

A third series of tests was instituted in a still deeper shaft (630 ft. deep and 8 ft. diam.) and these proved to be the most important and conclusive of all. A scaffold was fixed at a depth of 540 ft. and two cannons, side by side, attached to it. The experimental shaft was upcast from a pumping shaft a little distance away, the ventilation traveled from one to the other through a gallery lined with brickwork, the air moving at the rate of 100 ft. per minute.

An analysis of the air proved firedamp to be entirely absent. Charges of 1½ lb. of gunpowder were used, and from 3 to 4 cwt. of dust were used in each experiment, the bulk of which, lodged on the scaffold or fell to the bottom of the shaft, the active portion adhering to the timbers above the position of the cannons. Two cannons were used with the intention of raising the dust with the first shot and thus getting it into suspension in the air, ready for the second shot, but as events proved, the most successful and violent explosion took place when only one cannon was fired. A preliminary trial shot without dust was fired so that a proper comparison of results might be made.

RESULTS OF EXPERIMENTS

There were in all 16 trials in this deeper shaft; in 9 cases, so far as could be judged, the dust was not ignited, whereas explosions varying in violence instantly followed the firing of the shots in the other 7 instances; the last trial of all produced the most violent explosion, which, in the official report, is described in the following words: "Dust was ignited, followed by a continuous roar and a rush of flame completely filling the shaft mouth and ascending 60 ft. into the air. This was the most violent explosion since the commencement of the experiments. It is difficult for anyone who did not witness this experiment to realize the extent of the explosion. The flame continued to issue from the pit for 5 or 6 sec., followed by dense smoke. The violence carried away some of the wood-work 37 ft. above the pit mouth (only one cannon was fired)."

Professor Galloway was present and witnessed this experiment, and at once expressed the opinion that all previous experiments were dwarfed to absolute nothingness; he was highly pleased to have himself seen his views, so long and perseveringly affirmed, verified in such a striking manner. On four different occasions during the experiments, the flame traveled 600 ft. and ceased only when it reached the mouth of the pit; there was an undoubted increase of violence as it traveled on its course.

The details of these tests, which are "historic," were in due course submitted to the authorities, and Henry Matthews, (now Lord Llandaff), at that time His Majesty's principal secretary of state, in a brief dated December, 1890, the year in which the Llanerch and Morfa explosions happened, refers to these experiments as follows: "As I felt the great importance of arriving at further information and more certain conclusions on this subject, I sanctioned the proposal of Mr. Hall, Her Majesty's inspector of mines, to conduct experiments for the purpose of ascertaining whether an explosion can be caused by blasting operations when coal dust is present, and in the entire absence of gas or firedamp."

"Mr. Hall has the merit of having been one of the first to draw attention to this subject. He, as well as Mr. Galloway, whose opinions are well known and have been often published, brought the matter prominently before the royal commission appointed, in 1876 to report on accidents in mines, before whom, however, these opinions met only with partial acceptance. The subject has also been specially investigated in the Durham district by J. B. Atkinson and W. N. Atkinson, Her Majesty's inspectors of mines."

"The result of Mr. Hall's experiments is reported by him in a paper which accompanies this circular, and to which I desire to call most serious attention. The conclusion deduced by Mr. Hall from his

experiments is, that a blown-out shot may, in the presence of coal dust, and in the entire absence of firedamp, cause explosions of great violence, often accompanied by volumes of rushing flame, traveling considerable distances, and possibly as far as the supply of coal dust continues."

In 1891, a royal commission on explosions from coal dust in mines was appointed. The members of that commission were the Right Hon. Joseph Chamberlain, M.P. (chairman), Lord Rayleigh, Sir William T. Lewis, Harold B. Dixon, Emerson Bainbridge and Charles Fenwick. At the instance and by the directions of this commission, I undertook to carry out a long series of experiments to test representative dusts from the various mining districts in Great Britain. With this object, samples were procured from 45 separate collieries and from 36 distinct seams; these samples were subjected to similar tests to those already described. This work occupied 12 days, the weather throughout being fine and warm and on several days there was an unusual difference between the wet and dry thermometers showing the atmosphere to be very dry.

The experiments were commenced on each day by firing a 2-lb. charge of gunpowder without dust, so that the onlookers might be better able to judge of the part played by the dust in the subsequent experiments. The conditions of the test were kept as nearly alike as possible for each sample, and on the completion of each test, blank shots were fired to clear the shaft of dust, before another sample was proceeded with. One hundred and three shots of gunpowder were fired, the charge in each case being $1\frac{1}{2}$ lb.; 10 shots of roborite and 3 shots of ammonite were also fired, the weight of charge being 8 oz. More than 50 per cent. of the gunpowder shots resulted in violent explosions of dust, and where there was not an actual explosion, there was always considerable charring of the electric cable except in one or two instances, showing that the dust had ignited but was of such a nature or so impure that it could not develop into a veritable explosion. Of the 10 shots fired with roborite, and those with ammonite, there was neither any sign of an explosion of dust nor any charring. The fact that the "high explosives" behaved so differently to ordinary gunpowder is most important, and at once suggests a means of mitigating the danger of blasting in coal mines.

In reporting these experiments to the royal commission, the conclusions were summarized as follows:

"1. That coal dust from several seams in different districts, notably those from Glamorgan, Monmouth, Durham, Lancashire, Yorkshire and Scotland, are almost as sensitive to explosion as gunpowder itself.

"2. That coal dust is, as a rule more

sensitive to explosion in proportion to its high quality and freedom from impurities.

"3. That a ready supply of oxygen, such as is supplied by a brisk ventilation, has the effect of making coal-dust explosions more probable and more severe.

"4. Of the whole of the dust tested, that from the Albion colliery, Glamorgan, excelled all others in violence and sensitiveness to explosion."

Note. Within a year from the date of this report, there occurred at the Albion colliery one of the most sweeping and disastrous explosions which has ever been recorded; 290 people were killed.

"5. With regard to precautionary measures to be taken in the face of these facts, I have again to urge the total abolition of gunpowder from coal mines and the substitution of certain high explosives."

The commissioners examined every one whom it was thought could throw any light on this subject. Among the witnesses were the late Sir Godfrey Lushington, the late Sir Frederick Abel and the leading mining engineers of the Kingdom.

The evidence was conflicting, but anyone who studies it carefully and impartially can hardly fail to be convinced that where dry coal dust is allowed to accumulate and be carried forward by the ventilation and traffic throughout the main arteries of a mine, a disaster of great magnitude may be developed either by a gunpowder shot blowing out, or by the accidental ignition of a small and otherwise harmless quantity of firedamp.

THE COMMISSIONERS' CONCLUSIONS

The commissioners give a summary of their conclusions as follows:

"1. The danger of explosion in a mine in which gas exists even in very small quantities, is greatly increased by the presence of coal dust.

"2. A gas explosion in a fiery mine may be intensified and carried on indefinitely, by coal dust raised by the explosion itself.

"3. Coal dust alone, without the presence of any gas at all, may cause a dangerous explosion if ignited by a blown-out shot or other violent inflammation. To produce such a result, however, the conditions must be exceptional, and are likely to be produced only on rare occasions."

The last sentence in paragraph 3, rather weakens their conclusions and is calculated to throw great difficulty in the way of remedial measures; however, the following precautions which the commissioners suggest, especially No. 1, are definite and much to the purpose:

"1. That the firing of shots should be carried out between the shifts and when the majority of the men are out of the mine.

"2. Where general watering is not prescribed by the inspector, that the roads on either side of the place where a shot

is fired should be thoroughly wetted for a space of at least 30 yards.

"3. That large accumulations of dust, whether on the roof or floor, should not be allowed to remain."

These are the final words of the commissioners and it is curious that they make no mention of the desirability of substituting "high explosives" for gunpowder, although several witnesses spoke highly of these newer explosives. The commissioners do not appear to have given proper weight to the fact that these flameless explosives were already being used with success in several well conducted mines, a fact which nullified the adverse criticism of those who had no previous personal experience of their use.

After having made a study of all the great explosives, and being firmly impressed that blasting with gunpowder was the initial cause of nearly all these disasters, I became a strong advocate for the abolition of gunpowder. In a paper read before the Institution of Mining Engineers, I submitted figures showing the number of fatalities from so-called fire-damp explosions, which were directly due to blasting with gunpowder. These figures were alarming, and were a serious indictment against the continued use of this explosive. The paper also gave statistics from actual practice showing the effect on cost of working and quality of production in collieries where "high explosives" had already taken the place of gunpowder.

By the opponents of the change, it was constantly argued that the use of the more rapid high explosives would entail a large increase in the amount of small coal or slack in consequence of its shattering effect. It was asserted that there would be as much as 10 per cent. more small coal produced, that the cost of each charge would be double that of gunpowder; there was also a constant repetition of the stock phrase, that legislation in the direction indicated, "would lead to many mines being closed." It would, of course, have been a serious matter if the new explosive were likely to damage the coal to the extent suggested, but from actual results obtained at different collieries, I was able to show that an increase of 2 per cent. of slack was nearer the actual figure than 10 per cent.

The paper here referred to was severely criticized, especially by north of England engineers and I was attacked by a section of the press in an unfriendly spirit; indeed there seemed to be an honest conviction that the abolition of gunpowder spelled almost ruin to the coal trade.

In 1896 the Coal Mine Regulation Act of 1887, was amended, and Section 1 of the amended act reads: "(1) the power to propose, and modify special rules for a mine under the Coal Mines Regulation Act of 1887 (in this act referred to as the principal act) shall include powers

with respect to any of the following matters:

"(a) The nature and description of the lights or lamps to be used in the mine and their custody and the mode of using and trimming them, and

"(b) The description of explosives to be used in the mine, the mode of using and of storing such explosives, and of making and stemming holes, and the times at which and the manner in which shots are to be fired in the mine, and,

"(c) The number or class of persons, if any, to be permitted to remain in the mine or any part thereof while shots are being fired, and,

"(d) The watering or efficient damping of the mine or any ways or places therein, and,

"(e) Generally the precautions to be adopted for the prevention of accidents from inflammable gas and coal dust."

This extension of the power of the secretary of state was proposed by Sir William Harcourt—himself an ex-home secretary—and in due course the power thus conferred was taken advantage of to make an order to be called the "Explosives in Coal Mines Order." The following is the text of that order:

"Whereas by Section 6 of the Coal Mines Regulation Act, 1896, it is enacted that a secretary of state, on being satisfied that any explosive is, or is likely to become, dangerous, may by order, prohibit the use thereof in any mine or in any class of mines either absolutely or subject to conditions: I hereby, in pursuance of the power conferred on me by the aforesaid section, make the following order:

"1.—(a) In all coal mines in which inflammable gas has been found within the previous three months in such quantity as to be indicative of danger, no explosive, other than a permitted explosive as hereinafter defined, shall be used in or taken for the purpose of use into the seam or seams in which the gas has been found, or any shaft or drift communicating therewith which is in process of being deepened or sunk or being driven, as the case may be.

"(b) In all coal mines which are not naturally wet throughout, no explosive, other than a permitted explosive as hereinafter defined, shall be used in or taken for the purpose of use into any road or any dry and dusty part of the mine, or any shaft or drift communicating therewith which is in process of being deepened or sunk or being driven, as the case may be.

"2. In all such coal mines or parts thereof as aforesaid, the use of permitted explosives is prohibited unless the following conditions are observed:

"(a) Every charge shall be fired by a competent person (hereinafter called the shot-firer) appointed in writing for this duty by the owner, agent, or manager of the mine, and not being a person whose

wages depend on the amount of mineral to be gotten.

"(b) Every charge of the explosive shall be placed in a properly drilled shot hole and shall have sufficient stemming, and each such charge shall consist of a cartridge or cartridges of not more than one description of explosive.

"(c) No cartridge shall be used unless it is marked in the manner set forth in the third schedule hereto, in addition to any marking required by the first schedule hereto.

"(d) No charge shall be fired except by means of an efficient electrical apparatus so inclosed as to afford reasonable security against the ignition of inflammable gas, or by a permitted igniter-fuze, as hereinafter defined.

"(e) Where the charge is fired by an electrical apparatus, the shot-firer shall not use a cable for the purpose, which is less than 20 yd. in length. He shall himself couple up the cable to the charge and shall do so before coupling the cable to the firing apparatus. He shall also himself couple the cable to the firing apparatus. Before doing so, he shall see that all persons in the vicinity have taken proper shelter. Should the charge miss fire, he shall immediately disconnect the cable from the firing apparatus.

"(f) Every electrical firing apparatus shall be provided with a removable handle or safety plug, or push button, which shall not be placed in position or operated until the shot is required to be fired and which shall be removed or released as soon as a shot has been fired. The removable handle or safety plug shall at all times remain in the personal custody of the shot-firer while on duty.

"(g) Each explosive shall be used in the manner and subject to the conditions prescribed in the schedules hereto.

"(h) Where two or more shots are being fired in the same place and such shots are not fired simultaneously, the shot-firer shall make an examination for gas immediately before the firing of each shot, and shall not fire the shot unless he finds the place where the shot is to be fired and all contiguous accessible places within 20 yd. free from gas and safe for firing.

"Provided that nothing in this order shall prohibit the use of a safety fuse in any mine in which inflammable gas has not been found within the previous three months in such quantity as to be indicative of danger.

"3. In every coal mine the use of any explosive is prohibited in the main haulage roads and in the intakes unless all workmen have been removed from the seam in which the shot is to be fired, and from all seams communicating with the shaft on the same level, except the men engaged in firing the shot, and in addition such other persons not exceeding to in number as are necessarily employed in attending to the ventilating furnaces, steam

boilers, engines, machinery, winding apparatus, signals, or horses, or in inspecting the mine; or unless a permitted explosive is used under the conditions prescribed in Section 2 of this order, and every part of the roof, floor, and sides of the main haulage road or intake, within a distance of 20 yd. from the place where it is used, is, at the time of firing, thoroughly wet, either naturally or from the application of water thereto.

"This section shall not apply to such portions of the main haulage roads and intakes as are within 100 yd. of the coal face.

"This section shall not authorize the use of any explosive in any case where the use of such explosive is prohibited by Sections 1 or 2 of this order.

"4. Detonators shall not be used in or taken for the purpose of use into any mine unless the following conditions are observed:

"(a) Detonators shall be under the control of the owner, agent, or manager of the mine, or some person or persons specially appointed in writing by the owner, agent, or manager for the purpose, and shall be issued only to shot-firers or other persons specially authorized by the owner, agent, or manager, in writing.

"(b) Shot-firers and other authorized persons shall keep all detonators issued to them until about to be used, in a securely locked case or box, separate from any other explosive.

"In the case of a shaft being sunk from the surface, it shall not be deemed a contravention of this section if the primers for charges are fitted with detonators on the surface before being taken into the shaft, provided the primers are so fitted in a workshop established under Section 47 of the Explosives Act, 1875, and are only taken into the shaft immediately before use by the shot-firer or other authorized person, and in a thick felt bag or other receptacle sufficient to protect them from shock.

"5. Sections 1, 2 and 3 of this order shall not apply to mines of clay, or stratified or nodular ironstone, nor shall they apply to shafts in course of being sunk from the surface, or deepened, or to drifts and other outlets being driven from the surface, except as provided by Section 1 of the order.

"Where a mine contains several separate seams, this order shall apply to each seam as if it were a separate mine.

"6. In this order, the term "permitted explosives" means such explosives as are named and defined in the first schedule hereto, and the term "permitted igniter-fuse" means such igniter-fuses as are named and defined in the second schedule hereto; provided that where the composition, quality or character of any explosive or any igniter-fuse is defined in such schedule, any article alleged to be such explosive or such igniter-fuse which differs therefrom in composition, quality

or character, whether by reason of deterioration or otherwise, shall not be deemed to be the explosive or igniter-fuse so defined; provided further that an owner, agent or manager shall not be responsible for the composition, quality or character of an explosive or igniter-fuse, if he shows that he has in good faith obtained a written certificate from the maker of the explosive or igniter-fuse that it complies with the terms of the schedule, and that he has taken all reasonable means to prevent deterioration of the explosive or igniter-fuse while stored."

This is the position as it is today. The order makes it illegal to use any explosive other than a "permitted explosive" in mines coming within the category of fiery, or dry and dusty. A permitted explosive is one which has passed the official test at Woolwich arsenal. The conditions of these official tests are similar to those laid down in a proposal which has recently been submitted to the American authorities. Gunpowder has entirely failed to pass the tests and hence it is no longer used in mines to which the Explosives in Mines order applies.

LEGISLATION HAS PROVED BENEFICIAL

This legislation has proved beneficial beyond all expectation. The order first came into force in 1897 and we find the average annual loss of life from explosions since that date to be 50 per cent. fewer than was the case in a similar period immediately preceding its operation. I believe that this great diminution in fatalities from explosions has been chiefly due to the fact that the use of gunpowder which always entailed a constant risk of blown-out shots, has been largely dispensed with.

The interference with the economic position has been trifling and the present users of the "high explosives" have now no cause to regret the change; in fact, for much of the work underground, experience has shown the newer explosives are more economical than the old.

In conclusion, it is perhaps well to remind the workers in mines that all the labors of scientific experts will prove of no avail to avoid disaster unless they themselves are willing to submit to strict discipline and cheerfully comply with the regulations made for their safety, and also to remind the higher authorities in whose hands the administration of the law rests, that without their sympathy and support, it is impossible for mine officials to adequately control large bodies of men.

Prospecting for antimony ores, among which stibnite, the sulphide of antimony, is most prominent, has been carried on (*Chem Trade Journ.*, April 24, 1909) in South Burma, and in Lahaul, where a large deposit occurs near the Shigri glacier. Stibnite seems to be widely distributed in the Tenasserin division of South Burma.

The Bottineau Gas Field

By JOHN G. BARRY*

During the last year and a half several discoveries of natural gas in Bottineau county and eastern Ward county have caused considerable excitement. The first discovery was made at the Parker farm about 9½ miles south of Westhope on July 3, 1907, when gas was struck at 178 ft., while drilling a well for water. Since that time many wells have been drilled for gas in the same region and a number of them have been successful. Accordingly a preliminary investigation of the region was made early in September, 1908. The time possible for this work was very limited, and only the main facts in regard to the field were obtained.

The wells drilled in the vicinity of the Parker farm pass through the glacial covering and cut a gas-bearing sand at depths ranging from 154 to 176 ft. Four wells at this place have shown good flows of gas, while three others drilled to the north toward Westhope have been unsuccessful. A pressure exceeding 100 lb. per sq. in. and a flow of 2,000,000 cu. ft. per day is reported for each of the successful wells. The Great Northern Oil, Gas and Pipe Line Company, which has been carrying on prospecting at the Parker farm, has drilled a deep well in hope of striking a deep-seated body of gas. At the time of the visit to this region this well had reached a depth of 1180 ft. On Sept. 11, 1908, this well showed the following section:

Soil, 2 ft.; yellow clay and gravel, 30'; Blue clay, 122'; gravel with sand below (no flow of gas), 16'; white slate, 35'; black sand (seam), 3'; soft blue shale (caving), 242'; black slate, 50'; blue shale (caving), 205'; yellow hard rock (limestone), 5' in; blue shale, 145 ft.; sandy shale, 10'; blue shale to bottom, 320'; total, 1180 feet. Oil seepage is reported in the common wells of this vicinity, but this is probably due to decomposing organic matter in the drift.

At Mohall there are two wells which have yielded gas. They are about 7 miles west and north of the town, and about 26 miles west of the wells at Westhope. A generalized section of these wells was as follows: Yellow clay, 20 to 25 ft.; blue clay, 200'; blue shale, 70 to 80 feet.

Since the visit to this region gas has been reported as having been struck at the following places: Maxbass, 16 miles southwest of Westhope; Lansford, 10 miles southeast of Mohall; and at the McCaslin farm, 14 miles southwest of Mohall, and five miles west of the Parker farm, at a depth of 200 ft. The sand in which the gas is found varies in thickness in most cases from 16 to 20 ft. It is med-

*Assistant State Geologist, North Dakota Geological Survey.

ium fine grained, rounded, and of a greenish-black color due to an admixture of decomposing carbonaceous matter.

An analysis of the gas made by Prof. E. J. Babcock, of the School of the Mines of the University of North Dakota, shows the following results: Hydrogen, 0.5 per cent.; methane, 82.7; ethylene and other illuminants, 0.2; carbon monoxide, 1.2; oxygen, 3; nitrogen, 12.4 per cent. B.T.U. (calculated), 886 per cubic foot. The oxygen and nitrogen were probably from air present.

It is impossible at present to definitely outline the possibilities of the area. The gas is now being used locally in farm houses and it is proposed to pipe it to

of the ice sheet.¹ Considering Upham, McHenry county, the Coteau du Missouri lies about 50 miles to the southwest and runs in a northwest-southeasterly direction. The Turtle mountains lie about 25 miles to the northeast of Upham. Both the Coteau du Missouri and the Turtle mountains have a considerably greater altitude than the region under consideration. Undoubtedly the coteau and the mountains were at one time continuous, and their present relationship is due to erosion.

It is universally thought that the erosive action of the ice sheet was limited to wearing down the smaller elevations and partly filling the pre-existing valleys with

was deposited throughout the region a considerable amount of detrital material with an admixture of organic matter, probably of vegetable origin. Upon the decomposition of the organic matter the debris would act as an excellent gas reservoir. This theory as to the origin of the gas occurrence of this region is put forward with only a slight knowledge of the existing facts, and is only a preliminary one, conditioned by the gathering of additional data.

Rand Stope Drill Competition

The photographs reproduced herewith show several of the drills entered in the

Westhope for use there, and later to some of the other surrounding towns.

Most of the wells of this area which have been productive are situated within the area of Glacial Lake Souris, the gas occurring in a layer of sand immediately underlying the glacial drift. Upon the recession of the ice-sheet from the Coteau du Missouri a glacial lake known as Glacial Lake Souris was formed, lying between the coteau and the southern border

its debris. Considering the course of the Coteau du Missouri, and the Souris and Sheyenne rivers, it is reasonable to suppose that previous to glacial time there lay to the north and east of the coteau a principal drainage area which had a northwest-southeast course, and which probably drained to the south and east. It is certainly reasonable to suppose that there

Rand stope drill competition. These are of interest in connection with the article "Surface Trials in Rand Stope Drill Competition," by Fustace M. Weston, in the JOURNAL of May 15, 1909, p. 998.

According to the statistics collected for THE MINERAL INDUSTRY, the production of arsenious acid increased from 2,020,000 lb., valued at \$101,000, in 1907, to 2,603,505 lb., valued at \$93,193, in 1908.

Salt in Austria

The salt deposits of Austria are extensive, says Consul-General W. A. Rublee, of Vienna. There are very large mines in Galicia near Cracow, at Wieliczka, and these furnish 36 per cent. of the salt Austria produces. Until a year ago the salt in Galicia was mined, but now the easier method of artificially producing brine by introducing water into the mines has been largely adopted. This brine is then evaporated in open pans, in vats and by the vacuum process.

consumption of salt is estimated at $6\frac{1}{2}$ kg. per capita (14.3 lb.). The salt from Galicia and Moravia is sent to Russia under contract.

Amendment to Norwegian Mining Law

The text of the bill to be laid before the Norwegian Storting for amending the law relating to mining and water-power concessions prescribes that all companies acquiring such concessions shall

certain time, and preference is to be given to Norwegian labor and materials in carrying out the work.

The concessionaires may not, without special permission of the authorities, enter into any agreement or combination for raising the price of mining products or electrical energy to Norwegian consumers. A communal tax, equivalent to 5 per cent. of the water power, and a production tax of 1 to 3 per cent. of the value of ore at the mine, will be charged. Mines must be worked in a proper manner, and not to the detriment of the community.

VLOTMANN DRILL

The value of the salt at the source of production, whether mined or manufactured, ranges per 100 kg. (220 lb.) from 1.04 to 2.25 crowns (21 to 45c.), at which price it is sold by the government, salt being a government monopoly, to industrial concerns. This is exclusive of the cost of freight and packing. Other purchasers have to pay the tax levied on salt by the government, which varies in the different crown lands and ranges per 100 kg. from 14 to 20 crowns (\$2.40 to \$4). The average price, therefore, per 100 kg. is about 22.5 crowns (\$4.50). The annual

consumption of salt is estimated at $6\frac{1}{2}$ kg. per capita (14.3 lb.). The salt from Galicia and Moravia is sent to Russia under contract. The text of the bill to be laid before the Norwegian Storting for amending the law relating to mining and water-power concessions prescribes that all companies acquiring such concessions shall

In the event of the fines for infractions of the terms of the concessions increasing to a certain extent, the concession shall be forfeited to the state.

To prevent the formation of rust in boilers (*Petroleum Review*, April 24, 1909) experiments have been made at the Berlin Technical Institute, to use water deprived of the air it contains by means of charcoal. The decrease of rust in the boilers fed with water treated by the process has been about 25 per cent.

Tin Mining and Milling in North Queensland

The Tin-bearing Country Embraces 12,000 Square Miles; the Adoption of Modern Methods Will Render Available Much Low-grade Material

B Y G. W. W I L L I A M S *

The tinfields of North Queensland are found in the mountainous country that lies back of the coastal ranges from the port of Geraldton to Port Douglas. The hills composing the range vary in height from 2000 to 4000 ft. and form the watershed from which the Tate, Walsh and Herbert rivers flow to the Gulf of Carpentaria. The tin-bearing country embraces an area of 12,000 square miles. The district is tapped by two railways, the Stannary Hill-Irvinebank line from Boommo (82 miles from Cairns on the Chillagoe line) and by the Mount Garnet tramway which branches off the Chillagoe line at Lappa and runs back to the Smiths Creek mines. The Koorboora field lies on the Chillagoe line and forms the most westerly portion of the fields.

Wolfram, molybdenite and scheelite occur throughout the district, often in intimate association with the tin. The underlying rock of the whole area is granite which has been exposed by denudation in many places and which occasionally sends dikes into the overlying sedimentary rocks. Generally speaking, the tin lodes are composed of holocrystalline chlorite occurring in lenses or irregular bunches in the metamorphosed sedimentary rocks. Topaz, tourmaline and fluor spar are normal accessory constituents of the lodes, together with iron pyrites, wolfram and occasionally copper and bismuth. In some cases there is distinct evidence of the secondary enrichment of the lodes at the surface, but in most cases the mines do not show any marked fall in grade with depth. In one mine, I obtained some interesting tin crystals where the cassiterite was obviously a pseudomorph on tourmaline. Hundreds of small lodes have been worked throughout the whole area but in nearly every case ore of less than 2 per cent. has not been taken. With the exception of the mines owned by the Stannary Hill Company, North Queensland tin mining is controlled by John Moffat of Irvinebank, who has erected tin-dressing plants throughout the district and who owns in part or in entirety almost every mine. It was due solely to Mr. Moffat's enterprise that the Chillagoe, Mount Garnet and Mount Molloy mines were opened up.

The most important mine on the field is the Vulcan at Irvinebank. This mine is developed down to 1050 ft., at which

depth the lode is 100 ft. in length and 24 ft. wide, the ore averaging 7 per cent. tin. As depth has been gained the ore has shown little change, but the orebody is distinctly smaller in depth. It is worked by large underhand stopes and not a stick of timber or a ton of filling is used. The great vaulted stopes are open from the top of the mine to the bottom.

About four miles distant is the Governor Norman, a large low-grade mine. Up to date the low-grade (1 per cent.) mines have not been seriously attacked, except by the Stannary Hill company, but wherever I went I saw evidences of the existence of large areas of 2-per cent. ore. Under the present system of mining the lodes are worked only in the richer portion. Mining methods are archaic and in the matter of transport of ore both in the mine and on the surface the methods in vogue are barbaric in their simplicity. Costs must be appallingly high, for mines I visited that had been producing good ore for 10 years were still handling their ore by horse-whims up narrow underlay shafts of irregular grade.

The tin-dressing plants erected by the Irvinebank Mining Company (Mr. Moffat's firm), are up to date and do good work. At Irvinebank the plant comprises a 60-head battery with jigs, vanners and buddles. A tin smelter is attached and smelts concentrate and stream tin from the various dressing plants and river workings.

As will be seen when the work done by the Stannary Hills company is considered, the treatment of low-grade ore has met with some success. It is quite certain that with modern methods, modern plants and improved facilities for transport the 1.5 per cent. lodes will prove highly payable.

THE STANNARY HILL COMPANY

The leases owned by this company extend along the crest of a range of country the backbone of which appears to be composed of low-grade tin-bearing chlorite. There are several mines of which the most important are the Ivandoe, Kitchener and Extended. In the former mine the ore occurs in stringers and bunches in chlorite. These bunches make and cut out with little warning and are often of large extent. At 250 ft. depth the ore made into a bunch that measured 220 by 50 by 20 ft., and after cutting out entirely another bunch of ore, was again

picked up at 350 ft., measuring 120 by 10 by 50 ft. These bunches are worked out without timber. In some cases, where the deposit is long and comparatively narrow, the stopes have been carried up to 150 ft. in height without timber or filling. Throughout the whole district the country rock hangs perfectly and falls are almost unknown.

An adit level 2500 ft. in length has been driven under the line of leases. From this level it is proposed to prospect for ore with a diamond drill. The country is admirably suited for this kind of development work. The bunches follow a well marked shoot in the surrounding country. The ore shoot has been followed down to 700 ft. below datum and at present the shaft is being sunk with a view to opening up below that point. The ore averages 2 per cent. On the Kitchener mine a similar deposit has been worked, and the ore appears to be pitching into the ore shoot of the Ivandoe mine. On the Extended the crest of the hill is composed of low-grade ore (1 per cent. tin stone). It is the intention of the management to build a battery close to the hill and to open up a large open cut. There is little doubt that the venture will be entirely successful. At the Arbouin mine, about four miles distant from the Stannary Hill station, ore containing 1 per cent. tin stone was successfully treated by open cutting. Breaking cost 48c and haulage and development 50c. (Transport involved crossing a valley by aerial tram and three miles of railway.) Crushing cost \$1.00 per ton, making the total \$2.58 per ton (2240 lb.)

THE ARBOUIN MILL

The tin-dressing mill is situated on the side of the river about seven miles away from the mine, with which it is connected by the tramway. The trucks of ore are run down a steep incline and dumped into the bins from which the ore passes over a 2-in. Pike-Marsden ore breaker. A 1-in. grizzly receives the product and the oversize is returned by an elevator to a smaller breaker of the same type which reduces it to 1-in. cubes.

The product from the second breakers and the undersize from the grizzlies pass to the battery bins from which it is fed by means of Challenge feeders to 30 head of stamps. The latter weigh 1350 lb. and run at 104 drops per minute, with a 6-in. drop. The screen is woven, 121 mesh. The mill pulp passes to hydraulic

*Consulting engineer, Stock Exchange Club, Melbourne, Australia.

classifiers which separate the slimes and feed the sands to two 5-hutch jigs. The first heads, which contain about 25 per cent. of tin, go to the calciners. The product from the four other hutchies in each jig passes to a conical classifier which delivers the overflow to two, and the underflow to three Wilfley tables. The middlings from all five tables pass over another table and the middlings from this table are returned to the same table. The concentrates from all the tables go to the calciners; the tailings are discharged to the river and the slimes pass to the settlers.

The concentrates from all sources are collected in settling pits and are removed from these to a drier heated by the waste furnace gases. The calciner is a three-

recovery is approximately 90 per cent. on 2-per cent. ore.

It is most probable that the battery will be rebuilt on the side of the big mill at the Extended mine. A saving of 55c. per ton in transport will be effected when the alteration is complete and a better arrangement of the concentration plant will also effect a slight reduction in costs.

THE KOORBOORA TINFIELD

Koorboora, 108 miles from Cairns on the Chillagoe railway, is the center of a small but valuable group of tin mines. The Irvinebank Mining Company has a 10-head tin-dressing plant here for the purpose of treating ore from its mines and from the mines worked by tributaries and prospectors in the district. The bat-

terry is approximately 90 per cent. on 2-per cent. ore.

Throughout the district, I visited many small mines where small lodes or bunches of rich ore in low-grade orebodies were being worked with horse-whims. The Neville mine is of interest in that it is, I think, the largest wolfram mine in the world. The leases are situated about 1½ miles from the battery. The lode is a large chlorite body the limits of which have not been clearly defined. At 200 ft. the pay ore measures 150 ft. in length and averages 20 ft. in width. To date 800 tons have been crushed for a return of 6.6 per cent. wolfram (70 per cent.). The mine was under water at the time of my visit, but owing to an increase in the price of tungsten it was being unwatershed with a view to the restarting of stoping. This mine has a good vertical shaft and has been well developed.

Near the Neville is the Telegraph lease where a lode 50 ft. in length and 8 ft. wide is worked. The ore carries 4 per cent. each of tin and wolfram. In almost all mines in the tin country the ore is hand-picked in the stopes, the richer portions only being sent to the surface. Miners receive from \$2.16 to \$2.40 per 8-hour shift. In development work the "leading hand," who receives an extra 25c. per day, crushes and pans off his own samples.

THE TATE RIVER ALLUVIAL WORKINGS

The Tate river rises in the coastal ranges and flows westward to the Gulf of Carpentaria. The river gravels have been worked since 1876. The present company, an offshoot of the Irvinebank company, acquired its property in 1890, and since then has sluiced 175,000 tons of dirt for a return of 430 tons stream tin. The tin from these workings is exceptionally pure and the average value of the dressed tin stone is 74 per cent. metallic tin.

During the winter months the gravel is piled up at the head of large sluiceways and when the summer rains commence water is brought in by a race 7½ miles in length and the accumulated dirt washed down to the races where the tin is collected. The gravels are about 600 yd. wide and vary in depth from 1 to 15 ft. The company owns 103 acres of alluvial ground. The gravels average 5½ lb. of dressed tin per ton.

WOLFRAM CAMP

This camp is situated about 14 miles from Dimbulah, 73 miles from Cairns on the Chillagoe railway. The ground is held in miners' claims, leases not being allowed. The geology of the district is similar to that of the rest of the tin country, altered sedimentary rocks overlying the granites. The wolfram occurs

SIZING ANALYSES, MAY, 1906.

	BATTERY PULP.			FINAL TAILS.		
	Per Cent. Weight.	Per Cent. SnO ₂ .	Per Cent. of Total SnO ₂ .	Per Cent. Weight.	Per Cent. SnO ₂ .	Per Cent. of Total SnO ₂ .

hearth Merton furnace with extended forehearth. The roaster treats 120 long tons per week. The roasted concentrates are mixed with water and pumped up to three 4½-ft. gruding pans. The pulp from the pans is distributed over four double-belt Lühig vanners. The clean concentrate contains 70 per cent. tin oxide. The rest of the product is pumped up to two grinding pans and from these is distributed by classifiers to two double-belt Krupp-Lühig vanners. The concentrates are sent to the keiving tubs, the middlings are returned and the slimes and tails pass over three revolving buddles. These buddles also receive the slimes from the settlers. The concentrates from these buddles are returned to the calciners. The tails go out to the race. Gradings showing the nature of the battery pulp and the final tails, with the battery crushing through 225-mesh screen and no regrinding, as shown in an accompanying table. The ore consisted of 100 tons from the Kitchener mine (3 per cent. SnO₂), 984 tons from Ivanhoe (2.90), and 1941 tons from Abouin (1.4), a total of 3085 tons of 2.001 per cent. ore. Samples were screened dr.; 15-mesh screens were used on the battery boxes. Stamp duty was 5.4 tons per 4 hours. Slimes in the product through no mesh carried a trace of SnO₂.

Since the installation of grinding pans, sizing tests have not been made, but the

tery was erected nine years ago, and since then it has treated 40,000 tons of ore, obtaining 2200 tons of concentrates. The mines are situated within a radius of 4½ miles of the mill. The most promising is the Shakespeare mine, situated about ¼ mile from the mill. The lode has been opened up in an open-cut to 50 ft. in depth and is exposed for 80 ft. in length and 25 ft. in width. The main shaft is down 200 ft. and a large tonnage of 1- to 1.5 per cent. ore has been opened up. Under present conditions it does not pay to treat ore containing less than 1.75 per cent. tin stone. This mine is a good example of a mine which, if systematically opened up and connected by aerial tram with the battery, could make 1.5 per cent. ore pay with tin at \$650 per ton. The lode is massive chlorite somewhat irregular in outline but maintaining uniform metal content. The country rocks are greywackes and other altered sedimentary rocks.

The Southwick mine produces 10-per cent. ore from a narrow lode. The lode has been followed down to 200 ft. in depth by an underlay shaft which, like most North Queensland shafts, reproduces with faithful accuracy every variation in the dip of the lode. The ore is raised by horse. At the Tennyson group there is a large tin-bearing chlorite formation, but only the rich bunches in the lode are worked. At 120 ft. the ore averages 5

in small chlorite lodes which average 10 ft. in length and 2 ft. in width. Some larger shoots extend to 30 ft. in length and 5 ft. in width. The ore is mostly won by miners working their own ground, but in some cases claims have been amalgamated and are worked from one shaft. The deepest shaft is down 300 ft. and in depth the mineral contents appear to be practically unchanged. Generally speaking the lodes average 5 per cent. of wolfram and molybdenite. A dressing plant has been installed by the Irvinebank company. The plant comprises rolls, jigs, vanners and an oil flotation process for the recovery of molybdenite. The latter yields a 90 per cent. to 95 per cent. concentrate. The wolfram concentrate from the jigs and vanners contains 50 per cent. tungstic acid and 10 per cent. bismuth. With a good market for wolfram the district employs from 400 to 500 men, most of whom can make good money from their claims.

CONCLUSIONS

Reviewing these notes, made as a result of a fortnight spent in riding around the chief centers of the tinfields, I can only repeat the remark made frequently in connection with individual mines: the future of the field lies in the development and working of the low-grade lodes. It is a pity to see the rich portions of a lode stripped out while 1.5 per cent. ore is left in such a position that it can never be profitably recovered. The Stannary Hills company has demonstrated at its Arbouin mine that low-grade ore can be profitably treated even with high milling and transport costs. It remains now for the other tin mines to adopt modern methods and to realize that 1 per cent. tin ore is an extremely valuable asset and should not be thrown aside or buried in old stopes for want of better filling.

Of course there are mines that from their situation, can never hope to mine low-grade ore, but these mines are in the minority; the bulk of mines should be able to work on ore of far lower grade than that which is now considered unpayable.

The value of the mineral production of Queensland during 1908 (*Queensland Gov. Min. Journ.*, April 15, 1909) was £3,814,487, a decrease of £287,677, as compared with 1907. The deficiency was due to the lower value of minerals other than gold.

It is stated in the fourteenth annual report of the Rand Mines, that the ore reserves at the end of 1908 were: Main reef, 2,475,215 tons; Main reef leader, 3,666,556 tons, and South reef, 4,562,061 tons, making a total of 10,703,832 tons.

Mineral Production of French Colonies

SPECIAL CORRESPONDENCE

The Minister of Colonies has just issued the statistics of the mineral production of the French Colonies (Algeria and Tunis excepted) for the year 1907. The colonies referred to in the statistics include French Guiana, West Africa, Madagascar, Indo-China and New Caledonia. The values of the products for each of the principal colonies are as follows:

Guiana (gold).....	\$2,246,419
New Caledonia (nickel, cobalt, chrome ores).....	936,294
Madagascar (gold and iron ore).....	1,538,865
Indo-China (gold, tin, zinc, tungsten, coal).....	897,731
West Africa (gold).....	22,550
Total.....	\$5,061,859

The quantities and values of the different mineral products are given in the following table, the weights being in metric tons with the exception of gold, which is given in kilograms:

Gold.....	7,201 kkg.	\$4,065,878
Nickel ores.....	120,106 tons	600,532
Cobalt ores.....	3,800 tons	112,125
Tin and tungsten.....	128 tons	39,700
Zinc.....	6,020 tons	131,200
Chrome ore.....	29,818 tons	223,637
Coal.....	305,156 tons	637,528
Lignite.....	15,062 tons	29,371
Sundries.....	3,335 tons	22,033
Total.....	483,425 tons	\$5,882,004

Gold is obtained from placer workings and dredgings in Guiana, Madagascar, West Africa and Indo-China. The production of Guiana was 4160 kg. against 3593 kg. in 1906, declared for a value of 11,232,097 fr.; of Madagascar, 2940 kg. against 2200 in 1906; the balance came from Indo-China and West Africa.

The nickel ore (garnierite), a product of New Caledonia, shows a small increase, but the export is lessening with 103,542 tons, as against 130,688 in 1906. It will be noticed that the quantity of garnierite shipped in the last four years for which figures are available is greater than the ore produced, 458,175 tons being exported against 432,666 produced. It seems that the stocks on hand and the general business depression has brought about unfortunate conditions for the mining industry in New Caledonia. Great hopes are, therefore, directed to the metallurgical plants that are contemplated and under construction (Tao works). The export of chrome in 1907 from New Caledonia, was made by Birch & Co., Ltd., of London, in accordance with their agreement with the Société le Chrome. This has terminated, however, and the rich Tiebaghi mine has been closed.

Some new companies are now working for gold in Guiana and Madagascar, phosphate rocks in the Touamotou Islands in the Pacific, and copper in New Caledonia, but they are not yet producing. The mineral output of the French colonies in 1907 was produced from 950 concessions of 587,367 hectares, 9664 men being em-

ployed. It should be noted that the production of the most extensively mineralized and worked region—the French Empire, Algeria and Tunis, is not included in the above statistics.

Henry H. Rogers

Henry H. Rogers, whose death was briefly noted in the *JOURNAL* last week, died suddenly in New York, May 19, aged 69 years. He was born at Fairhaven, Mass., and began life in rather a humble way, like most boys of his time and place. When about 20 years old he was attracted to Pennsylvania by the new discoveries and entered into business there. A few years later he came into contact with John D. Rockefeller and some others of the founders of the Standard Oil Company, and entered into close business relations with them, which ended only with his death. He soon became prominent in the direction of the Standard and was for many years its vice-president, being practically the chief manager after John D. Rockefeller retired from more active management; in which, however, Mr. Rogers always had an active and prominent part.

As he accumulated money he gradually became, outside of the Standard, a prominent figure in the stock markets, and a large owner of railroads and other securities. To him it was generally believed, was due the direction of the speculations of the "Standard Oil Group" which had so great an effect on Wall Street and which gave the group such a wide-spread influence on the railroad systems of the country.

About 10 years ago his attention was turned to copper, and he organized the Amalgamated Copper Company. Probably, as was generally believed at the time, the purpose was to control and centralize the copper production and business of the country, as oil had been controlled—though this purpose was not avowed. The course of the Amalgamated is a matter of history. Under Mr. Rogers' leadership it has, at any rate, become one of the great industrial institutions of the country, with an organization and technical management which is a model for similar corporations.

Mr. Rogers' latest work was in connection with the development of bituminous coal interests. He built the Virginian Railway, intended to develop certain sections of West Virginia and to furnish the coal mines of that State with a new outlet to tidewater. He furnished almost all the money for this enterprise and had plans for its extensive development, and for giving it a leading place in the eastern bituminous trade.

Two years ago Mr. Rogers had an apoplectic stroke, and after that began to withdraw from his large speculative ventures, though he retained his active interest in the Virginian Railway. It was

due to this that his death caused so little sensation on the stock markets. It has been said that he felt keenly the bitter attacks on the Standard Oil monopoly and on other activities in which he was concerned; but he never gave any outward sign of such feeling.

Personally he was much esteemed by his intimates; and he gave generously to the town of Fairhaven, where he was born, and where he retained a residence all his life.

A Memorial to Bennett H. Brough

At the time of the death of Bennett H. Brough, last October, well and widely known as an instructor in the Royal School of Mines and in other technical institutions, and for many years as secretary of the Iron and Steel Institute, it was noted that he had left only a scanty provision for his family. When this was ascertained, the members of the Iron and Steel Institute raised a fund for the assistance of his widow and children. The response was a liberal one, and this fund is now practically closed. Aside and apart from this, many of Brough's friends, and particularly those who had no opportunity of subscribing to the above fund, have expressed a desire to establish a lasting memorial which, it is suggested, should take the form of a scholarship for boys from the City of London School, where he was educated, tenable at the Royal School of Mines, where, both as student and teacher, he did such excellent work.

A committee has been formed having as secretary George T. Holloway, and as treasurer R. E. Commans, Speer Road, Thames Ditton, Surrey, England, to whom contributions may be sent.

Mr. Brough occupied for a long time positions which brought him in contact with many people, who quickly learned to appreciate his many admirable qualities. Many of them, not only his English associates, but also American and foreign engineers, will be ready to contribute to what seems to be a fitting memorial.

A Proposed Powell Memorial

The 60th Congress appropriated \$5000 for the erection of a suitable memorial to Maj. J. W. Powell, to be placed on the brink of the Grand Cañon of the Colorado. For the purpose of complying with the will of Congress the Secretary of the Interior asked W. H. Holmes, C. D. Walcott and H. C. Rizer to act as a committee to assist him in determining the character of the monument and in selecting the site.

At the earnest solicitation of numerous old-time associates of Major Powell, this committee has consented to initiate a movement among his friends for the erection of an appropriate monument over his grave at Arlington National Cemetery.

which remains as yet unmarked. This project will undoubtedly appeal not only to the personal friends of Major Powell, but to large numbers of those who appreciate his achievements in the several branches of science to which he so largely contributed.

The various statues in Washington commemorating the deeds of military heroes were erected by many societies. It would seem equally appropriate that those interested in scientific progress should commemorate the life and services of a man who was a leader along lines making for constructive rather than destructive work.

The character of the monument will not be decided upon until the fund has been raised, but the committee will be glad to receive from contributors suggestions relating thereto. Subscriptions will be received by H. C. Rizer, United States Geological Survey, Washington.

We are informed that the sum of \$600 has been collected in a short time, and with no special effort. We have no doubt that this sum will be largely increased by the many who appreciate the great services rendered by Major Powell to the cause of geology and geological exploration in this country.

Pig Iron Classification

The full report of the American Iron and Steel Association contains a carefully prepared statement of the different kinds of pig iron made, classified according to their quality and the purposes for which the iron was intended. This statement for two years past is given in the following table:

	1907		1908	
	Tons.	Per Ct.	Tons.	Per Ct.
Bessemer.....	13,027,083	50.5	7,086,360	44.5
Low-phosphorus	204,537	0.8	130,616	0.8
Basic.....	5,375,219	20.9	4,010,144	25.1
Forge pig.....	683,167	2.6	457,164	2.9
Foundry.....	5,066,311	19.7	3,575,210	22.4
Ferrosilicium.....	84,808	0.3	64,412	0.4
Malleable bessemer	920,290	3.6	414,957	2.6
Spiegelisen.....	283,430	1.1	111,376	0.7
Ferromanganese	55,918	0.2	40,642	0.3
Miscellaneous.....	86,508	0.3	47,137	0.3
Total.....	25,781,361	100.0	15,336,018	100.0

Low phosphorus pig is iron running below 0.04 per cent. phosphorus. The basic pig does not include a very small quantity of basic iron made with charcoal as fuel. Miscellaneous includes white and mottled iron, castings made direct from the furnace and a few tons of ferrophosphorus. Spiegelisen contains from 9 to 22 per cent. of manganese; ferromanganese, 45 to 82 per cent. The standard for spiegelisen is 20 per cent.; for ferromanganese, 80 per cent. manganese.

The more interesting changes are the smaller proportion of bessemer and the larger of basic iron. It is evident also that the demand for foundry iron did not decrease in spite of so great a proportion of the iron being made in the form of pig iron.

Production of Ores, Metals, Minerals and Chemicals in the United States in 1908

The accompanying tables show the production of some of the principal ores, minerals, metals and chemicals, in the United States during 1908, as collected for the forthcoming volume of THE MINERAL INDUSTRY:

PRODUCTION OF SECONDARY MINERALS AND CHEMICALS IN THE UNITED STATES.

Product.	Measure.	1908.	
		Quantity.	Value.
Alundum.....	lb.	3,160,000	\$189,600
Ammonium sulphate.....	sh.t.	87,600	5,245,240
Arsenic.....	lb.	2,603,505	99,193
Bromine.....	lb.	1,149,000	103,410
Carborundum.....	sh.t.	4,007,170	294,430
Coke.....	sh.t.	23,496,666	55,593,792
Copper sulph. (c).....	lb.	37,654,961	1,833,797
Copperas.....	sh.t.	35,334	388,674
Crushed steel.....	lb.	630,000	44,100
Graphite, artificial.....	lb.	7,385,511	502,667
Lead, white.....	sh.t.	116,628	10,515,315
Lead, refined.....	sh.t.	9,100	973,000
Lead, orange.....	sh.t.	11,358	1,156,282
Lead, mineral.....	sh.t.	393	43,157

Tungsten ore.....	sh.t.	497	126,281
Zinc ore.....	sh.t.	838,377	

(c) By product only. (i) Barrels of 42 gallons. (m) Includes a small quantity made from spelter. (o) Flasks of 75 lb. (p) Includes spiegelisen, although the value is given as ferromanganese.

The work on Feb. 1 in the New York State Barge Canal (*Engineering-Contracting*, April 7, 1909) was as follows: Work under contract, 194.1 miles; additional plans completed, 106.2 miles; plans over 75 per cent. completed, 71.9 miles; other plans in progress, 35 miles.

Colliery Notes

A careful miner will make it an invariable rule to use a copper scraper and clean the dust out of every shot-hole before inserting the charge.

At all coal shafts, where sinking operations are going on, the boiler should be set far enough away to make it impossible for a sudden flow of gas from the shaft to become ignited.

It is generally advisable when installing a power plant, to see that the ground at one end of a line of boilers is clear of buildings, so as to permit the addition of other units as required.

When special shot-firers are employed at a colliery, the miners should state the length of each shot-hole with chalk on a piece of board so that the shot-firer can properly proportion the charge required.

With reference to shaft accidents, the consensus of opinion seems to be that greater safety results from the use of detaching hooks rather than from safety catches. Many engineers fear these latter devices because they are liable to come into operation at a time when they are not wanted.

With the inauguration of the new laws regulating the valuation of Government coal lands, the possibility of purchasing cheap fuel beds, in the West, disappears. New River coal in West Virginia (with transportation convenient), can be purchased for \$75 an acre, while inferior coal lands in Utah are now valued at more than \$300 per acre.

In the mines of Great Britain, the continuous-current system has almost entirely been replaced by the alternating or polyphase-current system of electric supply. This latter is practically safe even in gaseous mines, for with the use of induction motors, the sparking troubles on commutators, which exist in continuous-current motors, are entirely dispensed with.

One authority states that a good feed-water heater will pay for itself in two months' operation. In actual practice, one such heater reduced the fuel consumption 16 per cent. An open heater is better than a closed heater and shows higher efficiency. This type of heater, however, must be used in connection with a good separator for removing the oil from the exhaust.

For use as a secondary-power producer in shaft sinking, the most satisfactory machine yet devised is the simple straight-line air compressor. This type of machine shows greater efficiency than the general run of small engines. A 10x16x18 in. compressor will be found sufficiently large to operate three or four drills and a pump in sinking a shaft of moderate depth. Compressed air has so far been found more satisfactory than

electricity as a secondary power in shaft sinking.

Where main or main-and-tail haulage is used, the haulage gear of the system of haulage is worked at full power for only one-third of the time; it then stands for about one-third, and runs at a much smaller power for the other third. Consequently the amount of power necessary for dealing with a given output with these types of haulage is much greater than with endless-rope haulage.

More attention is now being directed to the proper utilization of our peat bogs. One authority states that Michigan contains about 8416 sq.m. of swamp land, largely covered by peat and muck. Assuming that one-tenth of the peat area is workable, and figuring on a depth of 10 ft. (60 to 70 ft. is not unusual), this represents an available peat supply of 1,153,000,000 tons, having a gross value of \$3,459,000,000. The estimated cost of producing peat varies from \$1 to \$2 per ton.

Where main-rope haulage is used, it is impossible to fix any definite gradient upon which the cars will run back by gravity; the degree of slope upon which a train of cars will self-act, depends largely upon the weight of the cars, the size of the wheels, the condition of the road, and the weight of the rails. With heavy cars having large wheels, the train will run back on a gradient of less than 1 in 36; however, on an average kept road, with the car wheels of reasonable size, it will generally be found that a gradient of 2 in 26 is a fair allowance.

One authority on shot firing states that where there are high currents of air, the shot-holes should be placed with the direction of the air current, having the mouth of the shot-hole pointing away from the downcast shaft or intake air. This arrangement, it is said, will prevent the shot from blowing against the air. This same engineer believes that the air at many mines contains such a quantity of dust and occluded gas, that explosions have been caused by the concussion of shots against the mine air, which latter, in some cases, is more readily explosive than firedamp, and takes fire at a lower temperature.

The investigations recently carried on in mines after explosions have occurred, have shown that the most poisonous mixture of gases has been found along the track of the main explosion. The most insidious constituent present in these after-gases is carbon monoxide. One point brought out by these examinations is that the average miner will generally make for the main roads in his efforts to escape from the mine. The comment is made that where miners have followed this plan, they have usually been overcome by the poisonous gases encountered. On the other hand, as was shown at the West Stanley disaster in Great Britain, those men who take the circuitous routes in-

stead of the main roads, often get out safely.

An interesting point of difference in the coal mines of Europe and of America, is the shape of the shafts. In most European districts, the circular shaft is generally adopted, owing to the comparative ease with which it is sunk. Engineers who advocate the circular shaft advance the arguments that it is stronger, cheaper to sink and much more able to resist pressure than any other form; on the other hand, the chief disadvantage of the circular shaft is, there is a waste of space between the square formed by the cages, and the circumference of the shaft. However, this space at the present time is utilized as a medium for conveying power cables and pump mains to and from the surface; this space is also valuable as an opening for the free passage of air. In the various coalfields of Great Britain and on the Continent, the rectangular shaft, such as is used in America, has never grown largely in favor. Although the rectangular shaft can be better divided into compartments, and does not involve the waste of space that occurs with the circular form, the difficulty of sinking rectangular shafts, owing to the corners, which have to be kept square, combined with other disadvantages, are said to over-balance the favorable points of this form.

The engineer who attempts to master the problems of mine ventilation, should be familiar with the effects upon human respiration of an atmosphere containing more or less than the normal proportion of oxygen. A normal atmosphere may be regarded as consisting of two gases—oxygen and nitrogen—mixed together in the approximate proportion of 21 per cent. of the former to 79 per cent. of the latter. The proportion of oxygen in mine air may be reduced to as low as 15 per cent. before a person is likely to experience any difficulty in breathing, although lamps and candles will not burn in such an atmosphere. Any further reduction, however, is attended with serious consequences. When only 7 per cent. of oxygen is present in air, the face of the individual becomes gray, the lips blue, there occurs palpitation of the heart and a general dulling of the senses. Since a small deficiency of oxygen occasions such little actual discomfort, great care must be exercised in entering places where there may be a lack of this life-sustaining ingredient, as there are no preliminary symptoms, and in an atmosphere entirely deficient in oxygen, a man would become unconscious in 30 or 40 seconds, with little or no preliminary warning. It is also true that in deep mines, where the atmospheric pressure is greater than that ordinarily prevailing at the surface, a man may safely breathe an atmosphere containing a slightly lower percentage of oxygen than might be considered sufficient at ordinary pressure.

THE ENGINEERING AND MINING JOURNAL

Issued Weekly by the

Hill Publishing Company

JOHN A. HILL, Pres. and Treas. ROBERT McKEAN, Sec'y.

505 Pearl St., New York.

London Office: 6 Bonriec Street, London, E. C., Eng.
CABLE ADDRESS: "ENGINEERING, N. Y."

Subscription, payable in advance, \$5.00 a year of 52 numbers, including postage in the United States, Mexico, Cuba, Porto Rico, Hawaii or the Philippines. \$6.50 in Canada.

To foreign Countries, including postage, \$5.00 or its equivalent, 33 shillings; 33 marks; or 40 francs.

Notice to discontinue should be written to the New York office in every instance.

Advertising copy should reach New York office by Thursday, a week before date of issue.

For sale by all newsdealers generally.

Entered at New York Post Office as mail matter of the second class.

CIRCULATION STATEMENT

During 1908 we printed and circulated 507,500 copies of THE ENGINEERING AND MINING JOURNAL.

Our circulation for April, 1909, was 43,000 copies.

May 1.....12,000

May 8.....10,000

May 15.....10,000

May 22.....10,000

May 29.....10,000

None sent free regularly, no back numbers.
Figures are live, net circulation.

The Eight-hour Law in California

The eight-hour law which was passed by the legislature of California at its last session took effect May 9, and is producing much trouble. The law is positive in its terms and forbids, under penalties, the employment of men underground for more than eight hours out of 24. Moreover, it extends to mills and smelting works, as well as to underground mines. A number of mine owners met in San Francisco recently and decided to take prompt legal action to test the constitutionality of the law, subscribing a fund for the purpose of meeting the expenses of a test case. Meantime they decided to obey the terms of the law, but to limit its action practically as far as possible. They they agreed to restrict work to eight hours, but resolved to count actual working time only at the face, excluding all time spent by the men in entering or leaving the mine. This, of course, would vary greatly at different mines, according to depth and other conditions.

The miners are not accepting these terms without active protest, and contend that the eight hours should run from the time they enter the shaft or tunnel until the return to daylight. Several strikes have already occurred. Thus, in the big mines at Jackson and Sutter Creek and thereabouts in Amador county on the Mother Lode, at Campo Seco and at Angels in Calaveras county, in mines at Sierra City, Sierra county, and at some places in Shasta county, the men have struck and refuse to comply with the rule adopted by the operators. The Austrian and Italian miners on the Mother Lode, of whom there are many, insist on working under the new law without any concessions to the operators. At the Shasta county smelting works and in Grass Valley and Nevada City the miners have been working under an eight-hour schedule for some time. The annual meeting of the State Miners' Union No. 2, Western Federation of Miners, occurs this week at Angels, and the question of fighting the operators in the California Miners' Association is to come up. If they decide to do so there will be many individual contests in different mines; but it is doubtful if the mine operators will stand together should this occur. There are many small mines in the State, owned by small, poor, small companies, who have

not the means or disposition to enter into a long and doubtful contest.

It is contended on behalf of the mine owners that many California mines are operated on a narrow margin; and that in a number of these the small profit might be turned into a loss by shortening the day without a reduction in wages, or by the substitution of three shifts for two. This is probably true in a number of cases. The legislature, however, refused to consider protests against the law on this or other grounds. The probability, judging from precedents in other States, is that the law will stand. There will be much friction, however, before matters are finally adjusted to its operation.

Hand Sorting

Hand sorting as a treatment of ore delivered from the mines is a process that is too often neglected. If practiced in the laborious ways of Mexico and Europe, it is undoubtedly too costly to be applied generally with high priced labor, which is the condition in most parts of the United States. If applied, however, in an economically arranged sorting plant, the process is frequently very profitable, delivering immediately a high-grade concentrate, at comparatively low cost per ton, and without incurring any loss from sliming or otherwise. A concentrating mill, meaning a jig or table mill, is the fashionable accessory to a mine. But there are many mines that lie idle for years, awaiting the provision of a plant of machinery for crushing and washing, which could be made to pay their way and eventually obtain the necessary mill by the introduction of a good system of hand sorting.

Even after the concentrating mill has been provided, it is frequently the case that ore is run through it which would better be removed by hand sorting. This is the case, for example, with ore of low grade, considering the general average, which nevertheless contains a good deal of galena that by the first crushing is liberated in pieces of $\frac{3}{4}$ to 1 in. in diameter. To run such ore through the crushers and rolls of the ordinary concentrating mill is but little short of criminal.

The conditions that we have mentioned exist to a large extent in the Cœur d'Alene. The absence of hand sorting in that district was for a long time a fea-

ture that attracted the attention of visitors. However, during the last year or two there has been a general introduction of picking plants, all of the big mines having been thus equipped, except the Morning and the Hunter. In fairness we must say that this is no new thing, inasmuch as the excellently managed Bunker Hill & Sullivan has practiced hand sorting to a more or less extent for upward of five years and is continuing to do so.

In the present practice of the Cœur d'Alene, the ore is roughly sorted into shipping product, concentrating ore and waste, the shipping ore being sent to the smelters and the waste being returned to the mines for filling. Because of this sorting the shipments of crude ore from the Cœur d'Alene increased materially in 1908 as compared with 1907. Opinion is not unanimous, however, as to the result of the practice. According to some authorities the sorting has considerably increased the extraction of ore, by reducing the slime losses which formerly were large, owing to the unnecessary crushing of brittle mineral. An advantage in hand sorting is found also to be the throwing out of sticks and blocks of wood coming from the mine, thereby preventing chokes in the launders of the mill.

The drawbacks to hand sorting in the Cœur d'Alene are: (1) High cost of labor, \$3 per nine-hour shift, and the impracticability of using boys or any form of cheaper labor. (2) The lower grade of the concentrate produced by hand sorting as compared with the mill concentrate. Against these drawbacks is undoubtedly a higher extraction of mineral, but the amount of the latter is difficult to determine. It is next to impossible to sample the product of the mines that goes to the sorting house, and in fact the matter of ore extraction is practically carried back to the stopes.

Some mines in the Cœur d'Alene do indeed practice ore sorting to a decided extent in the stopes. All the ore mined by them is moved by hand from the place where it was broken to the ore chute. During this transfer first class ore is picked out in large chunks, while freshly broken and clean, by the mine laborers (without otherwise interfering with their work) as an incident in the mucking of the ore. In certain mines, however, a limitation of this practice has been found in the insufficiency of chutes, or other

facilities, by which the accumulated first-class ore in the stopes can be segregated and brought to the surface. It is safe to say that when sorting of this kind can be successfully practiced underground, it may be continued even more advantageously on the surface where suitable provisions may be made. The most reliable gage of the value of the practice is, of course, the ledger of the bookkeeper.

Pig Iron Production of the World

The total pig-iron production of the world in 1908 showed a decrease of 12,470,000 tons, or a little over one-fifth from that of 1907. The greater part of this loss—over five-sixths—was in the production of the United States. The depression extended to all European countries which report decreases of greater or less amount; but none of them compare at all with the sharp and extreme reduction in our own output. This was to be expected, since European fluctuations in manufacture are never so violent in either direction as those of the United States. The small production of last year offsets the great make of 1906 and 1907. Following the United States, the larger losses in 1908 are found in those countries where the iron trade is most active usually, as in Germany, Great Britain and Belgium; but the reductions were only 15.5 per cent. in Belgium, 9.4 in Germany and 6.4 in Great Britain, compared with 38.6 per cent. in the United States.

The accompany table, prepared for THE MINERAL INDUSTRY, gives the pig-iron production of the world in 1907 and 1908, reduced to metric tons; the third column showing the percentage of change last year:

PIG IRON PRODUCTION OF THE WORLD.

	IN METRIC TONS		
	1907.	1908.	Change, Per Cent.
United States	26,193,863	16,190,994	D. 38.6
Germany	13,015,760	11,813,511	D. 9.4
Great Britain	10,082,638	9,438,477	D. 6.4
Three leading producers	49,322,261	37,442,982	D. 24.1
Austria-Hungary	1,405,000	1,390,000	D. 1.1
Belgium	1,422,940	1,206,400	D. 15.5
Canada	590,444	572,830	D. 3.1
France	3,588,949	3,391,150	D. 5.5
Italy	32,000	32,500	D. 1.6
Russia	2,748,220	2,718,000	D. 0.6
Spain	484,000	375,000	D. 2.6
Sweden	603,100	563,000	D. 6.0
All other countries	625,000	550,000	D. 12.0
Total	60,747,914	48,271,555	D. 20.5

The extent of the change is illustrated by the fact that in 1907 the United States made 43.1 per cent. of the pig iron of the world; in 1908 only 33.6 per cent. The proportion made by the three chief pro-

ducers was 81.2 per cent in 1907 and 77.8 in 1908. Further, the make of the United States in 1907 was 3,065,405 tons more than the combined output of Germany and Great Britain; while in 1908 it was 5,060,994 tons below their united production. Both of Chihuahua.

Gold Production in Australasia

The gold production of Australasia for the first quarter of 1909, as officially reported, shows a loss of 7.9 per cent., or very nearly \$1,400,000, as compared with the first quarter of 1908. In the six States of the Commonwealth of Australia the loss was 7.2 per cent.; while in New Zealand there was a decrease—hardly anticipated—of 11.7 per cent. In every case there was a decline from last year, though some of the changes were small.

The total Australasian production for the three months was as follows, in ounces of fine gold, South Australia and Tasmania being estimated:

	1908.	1909.	Changes.
New South Wales	62,592	47,403 D.	15,159
Queensland	93,145	92,722 D.	423
South Australia	2,400	2,350 D.	50
Tasmania	15,925	14,900 D.	1,125
Victoria	149,933	141,806 D.	8,128
West Australia	410,631	382,395 D.	28,236
Commonwealth	734,296	681,175 D.	53,121
New Zealand	124,318	109,761 D.	14,557
Total	858,614	790,936 D.	67,678
Total value	\$17,747,551	\$16,348,647	D. \$1,398,904

The greatest actual decline was in Western Australia, and was due to a decrease in the values of ores in the principal mines, rather than to diminished activity. The largest proportional loss was in New South Wales, and resulted for the most part from the diversion of men from mining to other industries. In Victoria there were fair increases in January and February, but for some unexplained reasons a heavy decrease in March brought the total for the quarter down to a lower point than last year. The New Zealand loss was chiefly from the dredging industry, which has been falling off for some time.

If the first quarter is to be taken as an index, the prospect for Australasia is that the gold production for 1909 will show a continuation of the decline which has been going on for several years. It is quite possible, however, that increases may be shown in the latter part of the year, as is frequently the case there. The attention given to the mining of other metals, especially copper, has not been without its effect on the gold mining industry.

Debatable Points Suggested by Articles in the Journal

CORRESPONDENCE AND DISCUSSION

The Cost of Mining Coal

The contribution to the literature of this subject in the JOURNAL of May 8, 1909, is both unique and instructive, and may be regarded as a classic which may be profitably studied by engineers and managers who desire to master the subject in its broadest conceptions. Mr. Finlay has rendered an invaluable service in showing how conclusions, both useful and specific, may be deduced from entirely general and non-specific data. Many business men who are not engineers, as well as engineers who have the business instinct, have the faculty of "sizing up" matters of cost and profit, from data such as Mr. Finlay uses, by a process possibly identical with the methods elaborated by Mr. Finlay. That article and the similar contribution on the "Cost of Pig Iron Made from Lake Superior Ore," furnish the material for a treatise defining the methods of which costs may be computed with a close approach to accuracy. When the engineer is confronted by difficulties which may seem insurmountable because of the impossibility of obtaining actual figures of cost, or of securing access to cost sheets, he has merely to adopt Mr. Finlay's methods to reach conclusions which will furnish close approximations to the truth.

Expressing this method mathematically we may write:

$$C = \frac{4W}{3O} + d + i + a;$$

in which

C = Cost per ton,

W = Average rate of wages per day of all employees,

O = Daily output in tons per employee,

d = Depreciation of plant per ton of output,

i = Interest on capital per ton of output,

a = Amortization charge per ton of output.

While there may be material differences in judgment as to what constitute proper depreciation, interest and amortization charges, if these be fixed by adopting current rates of interest and valuations determined by property appraisals in harmony with prices at which similar property is salable, these differences will not be large enough to make a material difference in the final result. In some cases a nearer approximation to actual

costs will be obtained by changing the numerical factor $\frac{4}{3}$ to $\frac{5}{3}$, making the formula read:

$$C = \frac{5W}{2O} + d + i + a.$$

In the absence of actual cost sheets or other data, the investigator has therefore to learn the average rate of wages of all employees, the average output in tons per employee, the approximate investment in plant and improvements, and in lands, etc., to enable him to make a close estimate of the cost per ton. The numerical factors $\frac{4}{3}$ and $\frac{5}{3}$ introduce an empirical method of approximating the cost of materials, supplies and incidental expenses, which in practice is generally from one-fourth to one-third of the gross cost. In other words, if the gross cost of mining be \$1 per ton, the labor cost is usually from $\frac{3}{4}$ to $\frac{3}{4}$ (66 to 75c.) of this amount, and the balance, $\frac{1}{3}$ to $\frac{1}{4}$ (33 to 25c.), represents these other items.

It may be thought that the experienced mine manager or engineer should be able to make such estimates from his special knowledge of the conditions in any district, and this is true if the engineer be personally familiar with the district or if he has had experience under practically like conditions, but even those of the widest experience will find the method useful in examining propositions located in districts with which they are not familiar, especially in checking up general conclusions based upon data furnished by parties in interest and which may be more or less unreliable.

Mr. Finlay makes a remarkable statement concerning the rate of wages when he says, "I do not believe that this is a factor at all." In its broadest sense this statement is possibly true, and the arguments which Mr. Finlay advances to support it are plausible and convincing, but the statement is one likely to be misunderstood and perhaps misapplied. I do not imagine that Mr. Finlay intends to convey the idea that an increase in the wage scale will not increase the cost of mining coal, but on the contrary as I understand the argument, he means that local differences in the wage scale result from differences in the cost of living in the different social environment, etc., and that such differences are apparent but not real differences, that the wage scale is the measure of the value of work done,

being the compensation received for such work and that the law of supply and demand keeps this practically uniform throughout the country. The same argument can with equal force be applied to all countries. While the question is one of academic interest, it has some practical bearing upon the issue and should be carefully considered, and Mr. Finlay has rendered a distinct service in directing attention to it.

A correct determination of the cost of mining is the most important function of the engineer when acting in an advisory capacity, for upon it must be based the appraisals of money values and advice as to whether the property can profitably be worked. If the cost be too high to permit profitable operation, its present money value must be small, its purchase may be undesirable, or if purchase has already been effected, its immediate sale may be advisable. The practical problem which the advisory engineer must solve is specific. It rarely relates to average cost in a given district (although for purposes of comparison this must be known), but on the contrary, is usually the determination of mining cost at a given property under existing physical and economic conditions, and the value of the service rendered must always depend upon the accuracy with which this is determined. The engineer has rarely to speculate upon questions affecting the wage scale, as this scale is usually known and fixed; farther, as any change in the scale will affect the cost of all competitive properties in nearly the same ratio, such possible changes may be disregarded. The pertinent question as to whether the property can be made to produce coal at a cost not exceeding the average cost in the district; if not, then the venture has a doubtful future; otherwise it may be favorably considered—assuming of course that the quality of the coal is equal to the average quality produced in that district.

THICKNESS OF COAL IS PRINCIPAL FACTOR

In addition to what Mr. Finlay has said, it may be useful to emphasize the fact that the principal factor affecting the cost of mining is the thickness of the coal. To graphically illustrate this, I submit a diagram showing cost curves which have been constructed to show how the thickness affects the cost of mining anthracite coal in Pennsylvania. These curves have been plotted from a large

collection of data, including actual costs under widely varying conditions.

The costs shown by these curves include all items properly chargeable to mining, but do not include the cost of preparing coal for market. These costs are not "run-of-mine" costs because they are computed by dividing the total cost of production by the number of tons of merchantable coal produced, excluding the waste and coal burned under the boilers of the mining plant. The items thus included embrace labor of every description, skilled, unskilled, clerical, etc.,

The costs as computed for these curves do not include any operations where the coal is mined by stripping in open-cut work, or where the coal is above water-level and is opened by drifts or tunnels, and are applicable only to coal opened for mining below water-level by shafts or slopes.

From an examination of the upper curve it will be seen that under favorable mining conditions (small output, poor management, depth and roof, faults, rolls, gas, crushed coal, water, slate and rock partings) the cost ranges from \$1.25

increases rapidly in the case of coals less than 4 ft. in thickness and that at the 3-ft. line the curve becomes very steep.

The average height of man limits the possibility of cheap mining to beds of coal 4 ft. or more in thickness; if man had a stature of 20 ft. he could mine coal 6, 8 or 10 ft. thick only by removing much rock or slate to gain room in which to work; if he stood but 2 ft. high, he could work beds 18 in. thick without removing any of the roof or floor to gain headroom. Hence for this and other reasons, we cannot hope to work thin coals at anything like an approach to the low costs which may be reached in mining thicker beds.

In addition to this limitation fixed by the height and size of the miner, the following conditions tend to increase the cost of mining thin coal seams:

1. The yield per acre is less, therefore the cost per ton for headwork, gangways, airways, shafts, cross-cuts, is correspondingly increased.

2. The yield per acre being less, more acres are required for a given output, the average underground haul is correspondingly longer and the haulage cost per ton is increased.

3. For the same reason the quantity of water to be pumped per ton of coal developed is larger, and the cost for pumping per ton of coal produced is correspondingly increased.

4. For the same reason the cost of ventilation per ton of coal is larger, often many times larger than in working thick coals.

5. The interest charge (account plant and equipment) is larger per ton of coal produced.

6. The cost of superintendence per ton of coal produced is larger.

A merely cursory investigation of these factors is sufficient to show that the thickness of workable coal is of predominating importance in determining the cost of mining.

By reference to the cost curves it is seen that the average difference in the cost of mining due to the presence of favorable or unfavorable mining conditions, in mining the thicker beds is from \$0.50 to \$1 per ton, and in mining the thinner beds is from \$1 to \$1.50 per ton.

It will of course be understood that in many cases where quite exceptional conditions are present, the costs may differ materially from those indicated by these curves, for example, a coal bed may contain 10 or 12 ft. of coal, but may be so crushed and faulted and contain so much waste that the mining cost may exceed \$2 per ton. These curves have not been constructed to include exceptions of this kind, being intended to show how, under fairly normal conditions the average costs vary with the thickness of the coal worked. The two curves shown, one to represent costs under conditions adverse to cheap mining, and the other under

Curves showing Cost of Mining Anthracite Coal, as affected by thickness of the coal worked, by H.M. Chance,

all materials used in repairs, maintenance and construction, all supplies consumed, general office expenses, etc., and new equipment bought in ordinary course of operation and development, as well as the cost of exploratory and other work incidental to consistent maintenance of property and increase of output. The items not included are the cost of preparing coal for market, cost of selling output, taxes, interest on investment, depreciation (cost of plant having been charged to operation) and amortization of value of lands.

to \$1.30 for beds containing from 15 to 20 ft. of coal, up to about \$3.40 for beds 2 ft. 6 in. thick. The curve beyond the 2 ft. line is hypothetically prolonged to the 2 ft. line, there being no actual figures available, for in the presence of unfavorable conditions coal less than 2 ft. 6 in. thick is rarely worked.

From an inspection of the lower curve it will be seen that when the conditions are favorable, the cost ranges from \$0.80 or \$0.85 for thick coals, up to from \$2.30 to \$2.00 for beds containing from 2 1/2 to 2 ft. of coal. It will be noted that the cost

conditions favorable to cheap mining, illustrate the ordinary extremes under what may be termed normal conditions.

These curves represent the experience at no particular operation, nor of any particular operating company. Owing to the varying conditions at different operations and in different localities, curves showing costs at single operations, or of the combined operation of several collieries under one management, would in many cases show little similarity to those shown by the diagram illustrating this article. A similar curve to show mining costs as affected by thickness of coal worked under present average mining conditions in the anthracite districts, might be used to show the actual cost of mining anthracite coal—but that is a matter entirely foreign to the purpose of this article.

At some future time I hope to construct similar curves to illustrate the effect of variations in thickness on the cost of mining bituminous coal. To make such illustrations effective and useful they should each represent the conditions and costs in a single field or district. In a general way the same principles apply to bituminous as to anthracite mining. In both, the thickness of workable coal is the factor of greatest importance in determining costs. Assuming that the wage scales in two districts, or at two mines, are equal, or practically equal, and that neither mine nor district has any overwhelming natural advantage over the other, the factor ranking next in importance is that of daily output. Large output should mean low cost. Next in importance, and often of greater importance than the output, is the character and ability of the management. Mr. Finlay has sufficiently emphasized the importance of the personal ability of the operator or manager in reducing costs. Good management implies efficient equipment, regularity of output and intensive operation. Unless hopelessly handicapped by natural obstacles (faults, thin coal, poor roof, deficient equipment or lack of a market), good management should insure the profitable operation of any coal property.

Philadelphia, Penn., May 11, 1909.

The "Consulting Engineer" and a Question of Ethics

The writer, who is a layman, has always had a vague respect for what are known as the ethics of the learned professions. Yet the following incident, which recently happened in New York, leads me to inquire if engineering societies prescribe any code of ethics for their members: Mr. B, a member of the American Institute of Mining Engineers, while acting as consulting engineer and stock-transfer agent

for a gold-mining concern, having an office in New York, receives reports of new ore discoveries in the mine. B thereupon makes an agreement with H, one of the company's directors, and with G, a stockbroker, to turn over to these two such stock as he can buy at a low figure from stockholders of his acquaintance on condition that B have an option on one-third of stock so purchased, at cost plus 6 per cent. interest. It is agreed that H and G are to provide the money for purchase of stock. In some instances B buys stock directly from owners by withholding all good news and by posing as a disinterested broker for the seller. Afterward the stock rises to a price on the New York Curb equal to five times the purchase price. After the three parties, B, H and G, have divided their stock holdings among themselves B (as the company's transfer agent) refuses to return to G stock certificates which the latter has sent in for transfer. B's only excuse is that a syndicate of directors interested in the stock, do not want B to return the stock. Presumably the syndicate did not want this stock to appear on the Curb where they might have to purchase it. Other parties' stock was held up in a similar manner.

Does the JOURNAL consider that B has been faithful to his profession of consulting engineer, to the stockholders of the corporation employing him, or to those whom he, in the guise of a broker, induced to become his clients?

SUBSCRIBER.

Philadelphia, Penn., May 17, 1909.

[The term "consulting engineer" is being employed in ways that are so meaningless that we expect to see it entirely given up by the leaders of the profession. Inasmuch as any bootblack or chiropodist may be a "professor," why should not anyone be a "consulting engineer?" The new graduate who opens an office immediately becomes a "consulting engineer." The superintendent or manager out of a job and waiting for another one to turn up subscribes himself in the meanwhile as "consulting engineer," because he thinks that the adjective implies that he is doing something, which simple "mining engineer" might not. Some eminent engineers are officially entitled by the large companies that exclusively employ their services as "consulting engineer" for such and such a company, which title is supposed to be higher than that of general manager. It has even been explained before a court of law that a consulting engineer is one who manages managers.

Now the very title of consulting engineer implies action in an advisory capacity. The engineer may often act strictly and solely in that capacity, just as the medical and legal men do, but often it is unsatisfactory to the engineer to give advice without assurance that his recommendation will be properly carried out.

and the execution may be left entirely to him. He then becomes a managing engineer, or a managing director. The continued use of the title of consulting engineer manifests a poverty of invention in the matter of titles. The superintendent is under the general superintendent. The general superintendent is under the general manager. If the organization requires that someone shall be over the general manager, why not call the next rank the "managing director," or "director general?"

For example, Pope Yeatman is in reality the director-general of the Nevada Consolidated, Cumberland-Ely and Steppe Valley companies. If any one of those companies should go to Dr. Peters for advice, they would go to him as a consulting engineer. This matter of title is not, like some others, a quibbling over dignity, and consequently of no importance, but on the contrary is one upon which some live questions of ethics depend. It is indeed the keystone of the question that is being discussed by the Mining and Metallurgical Society of America, with respect to the conditions under which an engineer is justified in accepting a contingent fee. In the course of this discussion Dr. H. M. Chance put the question very well in the following words:

"When an architect becomes the superintendent of construction for a firm of contractors, for the time being he ceases to be recognized as a professional architect; when a civil engineer becomes division superintendent of a railroad, he is no longer a civil engineer; and even when a lawyer becomes president of a corporation the public no longer regards him as a professional man; yet many mining engineers continue to be known as mining engineer for many years after they may have ceased entirely to do any professional work. This breeds confusion in the public mind, and a vague idea that the mining engineer is properly manager, inventor, promoter, or adviser at the same time, and consequently may be expected to act as his interests and those of his principals may require."

In the specific case cited by "Subscriber," the combination of consulting engineer and stock transfer agent suggests the incongruous. We shall make no comment upon this discord, but simply shall ask "Subscriber" to try to imagine J. Parke Channing, or John Hays Hammond filling those dual positions.

As to the ethics of the action of Mr. B as a stock-transfer agent, his relation to his company, his duty to his stockholders, etc., we do not think it necessary to express any opinion. We think, however, that the "gold-mining concern" in question might advisably follow the example of many large companies and entrust its stock transferring, etc., to some regularly organized and fully responsible institution.

—EDITOR.]

Patents Relating To Mining and Metallurgy

A Selected and Classified List of New Inventions Described during the Past Month in the Publications of the Patent Offices

UNITED STATES AND BRITISH PATENTS

A copy of the specifications of any of these patents issued by the United States Patent Office will be mailed by THE ENGINEERING AND MINING JOURNAL upon the receipt of 25 cents. British patents are supplied at 40 cents. In ordering specifications, correspondents are requested to give the number, name of inventor and date of issue.

ALUMINUM

ALUMINUM OXIDE—A Process for the Electrolytic Production of Aluminum Oxide. Frank W. Morris, Victoria, B. C. (Brit. No. 6449 of 1908.)

ELECTROLYTIC EXTRACTION—Art of Extracting Aluminum and Other Metals. Henry S. Blackmore, Mount Vernon, N. Y. (U. S. No. 920,893; May 4, 1909.)

ANTIMONY

ORE TREATMENT—An Improved Process and Apparatus for Treating Antimony and Other Ores. Henri L. Herrenschildt, Paris. (Brit. No. 7429 of 1908.)

ASPHALT

BY-PRODUCTS—A New or Improved Process for the Production of By-products from Asphaltnum, and the Like. Smith Everett, London. (Brit. No. 27,335 of 1907.)

SEPARATION PROCESS—Means for Separating Bitumen from Bitumen Bearing Ore. George M. Willis, Chicago, Ill. (U. S. No. 918,628 and 918,629; April 20, 1909.)

COAL AND COKE

BRIQUETS—Method of Producing Anthracite Briquets. John P. Lovejoy, New York, N. Y., assignor of one-half to Abe Stein, New York, N. Y. (U. S. No. 921,550; May 11, 1909.)

BRIQUETTING—Fuel-Briquet Machinery. Robert Deyllers, New York, N. Y. (U. S. No. 920,838; May 4, 1909.)

COKE—Improvements in Apparatus for Quenching, Screening and Lending Coke. Albert Goodall, Spennymoor, Eng. (Brit. No. 9226 of 1908.)

COKE—Regenerator System for By Product Coke-Ovens. Hugh Prentice, Bellevue, Penn. (U. S. No. 920,647; May 4, 1909.)

COKE OVEN. Carl Schroeter, Chicago, Ill., assignor of one-third to James F. Hill, Chicago, Ill. (U. S. No. 922,204; May 18, 1909.)

COKE OVENS—Improvements in or Connected with Coke-Ovens. The Coke-Ovens and By-Products Company, Ltd., and Stephen S. Wellington, London. (Brit. No. 6223 of 1908.)

COKE OVENS—Improvements in, or Relating to Regenerative Coke-Ovens. Joseph Mueller, Berne, Germany. (Brit. No. 11,688 of 1908.)

MINING METHODS—An Improved Method of Mining Coal, or the Like. Harry A. Kuhn, Pittsburgh, Penn. (Brit. No. 6074 of 1908.)

SEPARATOR Coal and Slate Separator. Herbert Mathewson, Shenandoah, Penn. (U. S. No. 920,972; May 11, 1909.)

COPPER

EXTRACTION FROM ORES—Process of Extracting Copper from Ores. Caleb G. Col Ins, Woodhenge, N. Y., assignor to Calvin Amory Stevens, New York, N. Y. (U. S. No. 919,130; April 20, 1909.)

MATTES—Improvements in the Treatment of Copper Mattes. James T. Carrick and Bessie S. Patterson, Johannesburg, Transvaal. (Brit. No. 12,750 of 1908.)

RECOVERY OF COPPER—An Improved Process for Eliminating Lead and Other Impurities such as Arsenic and Antimony from a Plumbiferous Copper Matte, Ore or Alloy, and Simultaneously Recovering the Copper as Metal. Alfred Schindler, Anvers, (Belgium). (Brit. No. 19,585 of 1908.)

GOLD AND SILVER

AMALGAMATOR. George H. Loucks, Chicago, Ill. (U. S. No. 920,880; May 4, 1909.)

CYANIDE PROCESS—Process of Extracting Precious Metals from their Ores. William L. Inlay, Conestoga, Penn., assignor to William L. Inlay Rapid Cyanide Process Company, a Corporation of South Dakota. (U. S. No. 919,434; April 27, 1909.)

EXTRACTION OF GOLD—Improvements in Extracting Gold from its Ores and Apparatus Therefor. Amédée M. G. Schillott and Louis Muecaire, Paris. (Brit. No. 5481 of 1908.)

EXTRACTION OF SILVER—Process of Extracting Silver from its Ores. James C. Pryor, North Bay, Ontario, Canada. (U. S. No. 918,998; April 20, 1909.)

GOLD SEPARATOR. Levan L. J. Swenson, Longmont, Colo. (U. S. No. 917,906; April 13, 1909.)

PLACER-GOLD SEPARATOR. Thomas G. Leavell, Spokane, Wash., assignor of one-fifth to William J. Parks, one-fifth to Henry L. Herkelrath, one-fifth to Edmund E. Brandt, and one-fifth to Merton J. Hills, Spokane, Wash. (U. S. No. 919,804; April 27, 1909.)

REFRACTORY ORE TREATMENT—Process of Removing Sulphur, Arsenic, and Other Like Impurities from Refractory Ores. Frank Cotton, Hornsby, New South Wales, Australia. (U. S. No. 922,088; May 18, 1909.)

IRON AND STEEL

BASIC BESSEMER PROCESS—Manufacture of Iron or Steel by the Basic Bessemer Process. Josy Flohr, Rodange, Luxemburg, assignor to Société Anonyme des Hauts-Fourneaux et Forges de Dudelange, Dudelange, Luxemburg. (U. S. No. 920,560; May 4, 1909.)

CINDER CAR—Tilting Device for Cinder-Cars. Mary R. Velch, Bessemer, Ala., administratrix of Richard C. Velch, deceased. (U. S. No. 916,636; Mar. 30, 1909.)

ELECTRIC REFINING OF STEEL—Improvements in and Relating to the Refining of Steel in Electric Furnaces. Communicated from the Company Rismarschlutte, Rismarschlutte, Germany. (Brit. No. 14,926 of 1908.)

FERRO-ALLOYS—Process of Making Ferro-Nickel and Nickel-Steel. Franklin R. Carpenter, Denver, Colo. (U. S. No. 922,388; May 18, 1909.)

FLUE DUST—Method of Utilizing Furnace-Flue Dust. Thomas M. Phillips, Youngstown, Ohio, assignor of one-third to the Youngstown Steel Company, Youngstown, Ohio, a Corporation of Ohio, and one-third to Edward L. Ford, Youngstown, Ohio. (U. S. No. 919,073; April 20, 1909.)

FURNACE OPERATION—Means for Cooling Furnace Walls. Luther L. Knox, Pittsburgh, Penn., assignor to Keystone Furnace Construction Company, Pittsburgh, Penn., a Corporation of Pennsylvania. (U. S. No. 919,190; April 20, 1909.)

GAS PRODUCERS—Improvements in, or Relating to Gas Producers for Use in Melting, Heating and the Like in the Manufacture of Steel. George V. Seiler Smith, Bolton, Eng. (Brit. No. 12,856 of 1908.)

METALLURGY OF STEEL. William S. Simpson and Howard Oviatt, London, England. (U. S. No. 918,582; April 13, 1909.)

OPEN HEARTH FURNACE. Luther L. Knox, Ben Avon, Penn., assignors to Keystone Furnace Construction Company, Pittsburgh, Penn., a Corporation of Pennsylvania. (U. S. No. 919,125; April 20, 1909.)

OPEN HEARTH FURNACES—Air and Gas Port for Open Hearth Furnaces. Frank D. Carney and Thomas T. McKee, Steelton, Penn., assignors, by mesne assignments, to Keystone Furnace Construction Company, Pittsburgh, Penn., a Corporation of Pennsylvania. (U. S. No. 919,184; April 20, 1909.)

ORE TREATMENT—Improved Method of and Apparatus for Treating Ores. John T. Jones, Iron Mountain, Mich. (Brit. No. 5515 of 1908.)

ORE TREATMENT—Method of Treating Iron Ore. Communicated from John T. Jones, Iron Mountain, Mich. (Brit. No. 12,322 of 1908.)

PRODUCTION FROM FINELY-DIVIDED ORES—Improvements in, and Apparatus for, the Production of Iron from Finely Divided Ores. Philip M. Pritchard and the United Alkali Company, Ltd., Liverpool, Eng. (Brit. No. 6561 of 1908.)

REGENERATIVE REVERSING FURNACE. Luther L. Knox, Ben Avon, Penn., assignor to Keystone Furnace Construction Company, Pittsburgh, Penn., a Corporation of Pennsylvania. (U. S. No. 919,185; April 20, 1909.)

LEAD

ELECTROLYTIC REFINING—Treating Anode Slime from the Electrolytic Refining of Lead. Anson G. Betts, Troy, N. Y. (U. S. No. 918,447; April 20, 1909.)

PURIFIER. Louis S. Hughes, Joplin, Mo., assignor to Picher Lead Company, Joplin, Mo., a Corporation of Missouri. (U. S. No. 920,333; May 4, 1909.)

LITHARGE—Method of Manufacturing Litharge. Louis S. Hughes, Joplin, Mo., assignor to Picher Lead Company, Joplin, Mo., a Corporation of Missouri. (U. S. No. 920,335; May 4, 1909.)

METALLURGICAL FURNACE. Louis S. Hughes, Joplin, Mo., assignor to Picher Lead Company, Joplin, Mo., a Corporation of Missouri. (U. S. No. 920,334; May 4, 1909.)

ORE TREATMENT—Method of Treating Argentiferous Lead Ores. Oliver H. Picher, Joplin, Mo. (U. S. No. 920,388; May 4, 1909.)

SUBLIMED WHITE LEAD—Method of Manufacturing Sublimed White Lead. Louis S. Hughes, Joplin, Mo., assignor to Picher Lead Company, Joplin, Mo., a Corporation of Missouri. (U. S. No. 920,332; May 4, 1909.)

NICKEL

RECOVERY FROM SILICIOUS ORES—Process of Recovering Nickel from Silicious Ores. Adolphe Chmins, Philadelphia, Penn. (Brit. No. 15,596 of 1908.)

PETROLEUM

OIL-CELLS. Device for Pulling Oil-Cells. Lawrence J. McKinney, Prairie Depot, Ohio. (U. S. No. 920,611; May 4, 1909.)

PUMPING—Apparatus for Pumping Oil from Petroleum Wells. Karel E. Ehrmann, Rajong Lenthir, Sumatra. (U. S. No. 919,142; April 20, 1909.)

SULPHUR AND PYRITES

FURNACE—Improvements in Furnaces for the Combustion of Mineral Sulphur. Giuseppe Galdo, Pavia, Italy. (Brit. No. 21,235 of 1908.)

TREATMENT OF PYRITES LIQUOR for Winning Metals Therefrom. John H. Thwaites, Peterborough, England. (U. S. No. 921,312; May 11, 1909.)

TIN

REFINING—Process of Removing and Recovering Tin. Julius Elkes, Mount Pleasant, Penn. (U. S. No. 919,839; April 27, 1909.)

RECOVERY FROM WASTE—Improved Process and Apparatus for the Recovery of Metallic Tin from Waste Tinned Metal Mixtures and Alloys of Tin and Lead, and Similar Metal Waste. Albert Nodon, Bordeaux, France. (Brit. No. 7584 of 1908.)

ZINC

DISTILLATION FURNACE. Woolsey M. Johnson, Hartford, Conn., assignor to the Continuous Zinc-Turnace Company, Hartford, Conn., a Corporation of Connecticut. (U. S. No. 920,473; May 4, 1909.)

EXTRACTION FROM ORES AND RESIDUES—Improvements in, or Relating to, the Extraction of Zinc from Ores and Zinc Residues. Wilhelm Hommel and the Metals Extraction Corporation, Ltd., London. (Brit. No. 27,920 of 1907.)

EXTRACTION PROCESS—Methods of Extracting in the Shape of Oxides, Sulphides and Sulphates Zinc and Other Metals from

Ores and Products Containing Them. Wilhelm Troeller, Frankfort-on-Main, Germany. (Brit. No. 6888 of 1908.)

FURNACE—Revolving Furnace for Volatilizing Zinc Ores. Harry H. Hughes, Springfield, Mo. (U. S. No. 920,143; May 4, 1909.)

FURNACE OPERATION—Improvements Relating to the Exhaustion or Extraction of Dust and Fumes Produced by Zinc Furnaces and the Like. Emile Der-Delattre, Dorplein, Holland. (Brit. No. 13,146 of 1908.)

PROTECTION OF WORKMEN—Means for Reducing the Operations of Zinc and Analogous Furnaces from Heat, Fumes and Dust. Emile Der-Delattre, Liege, Belgium. (U. S. No. 921,375; May 11, 1909.)

RECOVERY OF ZINC COMPOUNDS—Method of Recovering Zinc Compounds and Ammonia, from By-Products of Galvanizing. Elias G. Pearlman and Martin M. Pearlman, Philadelphia, Penn. (U. S. No. 919,375, and 919,376; April 27, 1909.)

SMELTING—Process of Smelting Zinc Ores. Anson G. Betts, Troy, N. Y. (U. S. No. 918,648; April 20, 1909.)

ZINC OXIDE—Method of Manufacturing Zinc Oxide. Louis S. Hughes, Joplin, Mo., assignor to Picher Lead Company, Joplin, Mo., a Corporation of Missouri. (U. S. No. 920,336; May 4, 1909.)

ZINC OXIDE—Method of Making Zinc Oxide. Louis S. Hughes, Joplin, Mo., assignor to Picher Lead Company, Joplin, Mo., a Corporation of Missouri. (U. S. No. 920,337; May 4, 1909.)

MINING—GENERAL

BLASTING—Means for Detonating Dynamite and Other Explosives. Frank Wells, Philadelphia, and George E. Potts, Pottsville, Penn., assignors to the Potts Powder Company, a Corporation of Pennsylvania. (U. S. No. 918,907; April 20, 1909.)

HOISTING—Improvements in, or Connected with, the Prevention of Overwinding in Mines. Harry B. Daglish and William S. Beck, St. Helens, Eng. (Brit. No. 6389 of 1908.)

VENTILATION—Improvements in the Ventilation of Mines. Herbert Ford, Exeter, Eng. (Brit. No. 12,343 of 1908.)

ORE DRESSING

BALL MILL with Feed of Fresh Material at the One End, Removal of the Material at the Other End, and Return of the Grinding Material on the Circumference of the Grinding Drum. Richard Bencke, Broumberg, Germany. (Brit. No. 15,453 of 1908.)

CONCENTRATING TABLES—Improvements in Concentrating Tables for Tailing Fine Mineral Matters. Arnold Bernard and Louis Sanna, Paris. (Brit. No. 19,314 of 1908.)

CONCENTRATORS—Improvements in and Relating to Ore Concentrators. Seth R. Swain, Denver, Colo. (Brit. No. 13,747 of 1908.)

CONCENTRATION—Method and Apparatus for Saving Slimes in Ore Concentration. James N. Flood, Denver, Colo. (U. S. No. 919,709; April 27, 1909.)

ELECTROMAGNETIC SEPARATION—Apparatus for Electro-magnetic Separation. Ferdinand Steiner and Heinrich Stein, Cologne, Germany. (Brit. No. 6323 of 1908.)

MAGNETIC SEPARATORS—Improvements in, or Relating to Magnetic Separators. Harold Alcock, Deseray, and Henry C. Simson, Hertschlag, Eng. (Brit. No. 18,855 of 1908.)

ORE-CONCENTRATOR, Emil Deister, Fort Wayne, Ind., assignor to the Deister Concentrator Company, a Corporation of Indiana. (U. S. No. 921,089 and 921,090; May 11, 1909.)

ORE-CONCENTRATING JIG AND COAL WASHER. George C. Hackstaff, Denver, Colo. (U. S. No. 922,419; May 18, 1909.)

ORE SEPARATION—Process of Separation of Metals. Richard L. Dyne, Chicago, Ill. (U. S. No. 921,372; May 11, 1909.)

SEPARATION PROCESS—Apparatus for Separating Solids from Liquids. Francis E. Elmore and Alexander S. Elmore, London, England. (U. S. No. 919,144; April 20, 1909.)

SEPARATOR—Improvements in, or Relating to the Separation of the Liquid and Solid Components of Wet Slimes or Ore Pulp. Horace G. Nichols, Ymir, B. C. (Brit. No. 2475 of 1908.)

TAILINGS DISPOSAL—Process of Disposing of Tailing Sand and the Like. John F. Jackson, Boughton, Mich. (U. S. No. 918,654; April 13, 1909.)

METALLURGY—GENERAL

AGGLOMERATION PROCESS—Process for

the Agglomeration of Small Finely Divided Ores. Antonio J. Fontakoff, St. Petersburg, Russia. (Brit. No. 4142 of 1908.)

BLAST-FURNACE OPERATION—Means for Running Off Slag from Blast Furnaces. Joseph Marsden and Edward Pearson, South Bank, England. (U. S. No. 922,304; May 18, 1909.)

ELECTROLYTIC REDUCTION—Process of Reducing Ores. Frank J. Tone, Niagara Falls, N. Y. (U. S. No. 921,183; May 11, 1909.)

EXTRACTION—Process of Extracting Metal from Ore. Caleb G. Collins, Woodmont, N. Y., assignor to C. Amory Stevens, New York, N. Y. (U. S. No. 919,129; April 20, 1909.)

REDUCTION PROCESS—Process for Testing or Reducing Ores. Edwin P. Welch, Denver, Colo. (U. S. No. 919,663; April 27, 1909.)

ROASTING PROCESS—Process of Subjecting Materials to the Action of Air or Other Gases. John E. Greenawalt, Denver, Colo. (U. S. No. 921,645; May 11, 1909.)

SEPARATION—Process of Separating Metals from Ores. Pierre Germain, Paris, France. (U. S. No. 921,227; May 11, 1909.)

SULPHIDE-ORE TREATMENT—Improvements in, or Relating to the Treatment of Sulphide Ores or Products. Woldeomar Hommel and the Metals Extraction Corporation, Ltd., London. (Brit. No. 6511 of 1908.)

MINING MACHINERY AND APPARATUS

BLASTING CARTRIDGES—Means for Waterproofing Blasting Cartridges. Axel Larsen, London. (Brit. No. 13,890 of 1908.)

BLASTING DEVICE. Charles P. McGregor, Pittsburgh, Penn. (U. S. No. 921,144; May 11, 1909.)

BLASTING FUSES—Improvements in Waterproof Caps for Blasting and Mining. Daniel M. Danckla, Valdez, Alaska. (Brit. No. 7585 of 1908.)

CAGES—Improvements in or Applicable to Pit Cages and Hoists. John Stoney and Joseph Hindley, Tyldesley, Eng. (Brit. No. 26,776 of 1907.)

COAL OR STONE DRILLING MACHINE. Albert Claremont, N. H., assignor to Sullivan Machinery Company, Claremont, N. H., a Corporation of Maine. (U. S. No. 920,067; April 27, 1909.)

CONVEYING APPARATUS—Improvements in Apparatus for Conveying Material in Mines and Other Restricted Places. Archibald Robertson, Blairhill, Scotland. (Brit. No. 14,713 of 1908.)

CONVEYERS—Improved Mechanical Feed for Bucket Conveyors. John West, Southport, Eng. (Brit. No. 10,798 of 1908.)

DRILLS—Improvements in Mining Drills. Aaron E. Jennings and James W. Jennings, Central City, Ky. (Brit. No. 6234 of 1908.)

DRILLS—Improvements in Percussive Drills for Use in Machine or Hand Rock Drilling. James Harrington, Natal and Robert Farrer, Johannesburg, Transvaal. (U. S. No. 917,8 of 1908.)

MINING CAR. Clayton M. Dillier, Jeannette, Penn., assignor of one-third to William Ruvelo and Joseph Torco, West Newton, Penn. (U. S. No. 920,033; April 27, 1909.)

MINER'S LAMP. Charles B. Hummel, Carnegie, Penn., assignor of one-half to Peter J. Scheib, Carnegie, Penn. (U. S. No. 920,882; May 4, 1909.)

PROSPECTOR'S TOOL—Individual Interlocking or Prospector's Tool. Edgar T. Conley, U. S. Army. (U. S. No. 919,132; April 20, 1909.)

PUMP—Hydraulic Rotary Pump. Ira H. Spencer, Hartford, Conn., assignor to Organ Power Company, Hartford, Conn., a Corporation of Connecticut. (U. S. No. 917,971; April 13, 1909.)

ROCK DRILLS—Improvements in or Connected with Percussive Rock Drills. William C. Stephens, Carr Brea, Eng. (Brit. No. 7630 of 1908.)

ROCK DRILLS—Improvements Relating to Pneumatic Rock Drills. Christian Christensen, Rendskirchen, Germany. (Brit. No. 7911 of 1908.)

ROCK DRILLS—Improvements in Percussive Rock-Drills. Holman Brothers, Cambridge, Eng. (Brit. No. 6756 of 1908.)

ROCK DRILLS—Improvements in, or Relating to Rock Drills or Other Percussion Tools. Thomas Watson, Nottingham, Eng. (Brit. No. 6064 of 1908.)

ROCK DRILL SHARPENING MACHINE. Clark J. Smith, Ottumwa, Iowa, assignor to Hardsgood Wonder Drill Company, Incorporated, Ottumwa, Iowa. (U. S. No. 920,093; April 27, 1909.)

ROCK-DRILL SHARPENING AND SHAPING MACHINE. Clark J. Smith, Ottumwa, Iowa, assignor to Hardsgood Wonder Drill Company, Inc., Ottumwa, Iowa. (U. S. No. 919,909; April 27, 1909.)

SAFETY CATCH—Automatic Catch for Mining Buckets, etc. Thomas C. Wright, Goldfield, Nev. (U. S. No. 922,373; May 18, 1909.)

SAFETY DEVICES—Improvements in Safety Devices for Lifts, Mine Cages and the Like. Albert Wright, Lincoln, Ill. (Brit. No. 28,257 of 1908.)

SAFETY LAMPS—Improvements in Apparatus for Igniting Miners' Safety Lamps Especially Suitable for Use in Underground Workings and in Like Places. Ernest A. Hallwood, Morley, Eng. (Brit. No. 839 of 1909.)

SAFETY LAMPS—Improvements in or Connected with Locking Bolts of Miners' Safety Lamps. Harry B. Buckley, Batley, Eng. (Brit. No. 10,870 of 1908.)

SAFETY LAMP—Miner's Safety Lamp. Lewis W. Cogswell, James D. Abel and William A. Miller, Taylorville, Ill. (Brit. No. 9235 of 1908.)

TRANSPORTING APPARATUS for Mines. Alfred E. Davis, Johannesburg, Transvaal, assignor of the rights to Richard Meyer, Johannesburg, Transvaal, Francis Hastings Medhurst, London, England, and John Edgar Ferrar, Johannesburg, Transvaal. (U. S. No. 918,661; April 20, 1909.)

TUNNELING APPARATUS. Henry Japp, New York, N. Y., assignor to S. Pearson & Son, Inc., Long Island City, N. Y., a Corporation of New York. (U. S. No. 922,431; May 18, 1909.)

TUNNELING MACHINE. Edward F. Terry, New York, N. Y., assignor to the Terry, Tench & Proctor Tunnel Machine Company, a Corporation of New York. (U. S. No. 917,974; April 13, 1909.)

VENTILATING-FAN for Mines. William L. Scott, Bridgeton, Ohio. (U. S. No. 921,744; May 18, 1909.)

METALLURGICAL MACHINERY AND APPARATUS

CRUCIBLE FURNACES—Improvement in Crucible Furnaces. William H. Holzapfel, Scotland, Penn. (Brit. No. 12,342 of 1908.)

DISCHARGING FURNACES—Pneumatic Apparatus for Discharging Furnaces. Samuel E. Hitt, Pittsburgh, Penn. (U. S. No. 916,314; Mar. 23, 1909.)

ELECTRIC FURNACE. Charles W. F. Correll, Ottawa, Ontario, Canada, assignor to Marcus Rutherford, Lockport, N. Y. (U. S. No. 916,548; March 30, 1909.)

ELECTRIC FURNACE. Hans Nathusius, Friedenshutte, near Morgenroth, Germany. (U. S. No. 920,078; April 27, 1909.)

ELECTROLYTIC REFINING—Acid-Proof Tank for the Electrolytic Refining of Metals. Anson G. Betts, Troy, N. Y. (U. S. No. 918,649; April 20, 1909.)

ELECTRIC SMELTING-FURNACE. Herbert C. Harrison, Exton, Penn. (U. S. No. 919,165; April 20, 1909.)

ELECTRIC SMELTING-FURNACE. Charles E. Wilson, Hood River, Ore. (U. S. No. 921,325; May 11, 1909.)

FURNACE for the Treatment of Metals. Wilhelm Schemmann and Jeger Brunn, Rombach, Germany. (U. S. No. 915,488; March 16, 1909.)

FURNACES FOR VOLATILE METALS—Improvements in, or Relating to Furnaces for Volatile Metals. Woldeomar Hommel and the Metals Extraction Corporation, Ltd., London. (Brit. No. 27,018 of 1907.)

MATTE CAR. Carl Revolving Matte Car. Jas. C. Kiker, East Helena, Mont. (U. S. No. 921,999; May 18, 1909.)

MELTING FURNACE. James E. Hewitt, Newark, N. J., assignor of one fourth to Christian Franz, Newark, N. J. (U. S. No. 918,150; April 13, 1909.)

METALLURGICAL FURNACE—Door-Frame and Roof-Skewback for Furnaces. Jacob B. McKinnon, Frank L. Parks and Samuel W. Gubb, Pueblo, Colo. (U. S. No. 918,356; April 13, 1909.)

METALLURGICAL FURNACES—Improvements in and Relating to Furnaces for Metallurgical Purposes. Peter Schmelzer, Metz, Germany. (Brit. No. 18,523 of 1908.)

NOZZLIZING—Improvements in Machinery for Making Blocks from Fine Ores, Blast Furnace Flue Dust and the Like. George P. Wallis, Horsham, Eng. (Brit. No. 10,541 of 1908.)

ORE ROASTING PLANT—Improvements in Coolers for Use in Connection with Ore-Roasting Plant. Thomas H. Webb, Poultice-Flyde, Eng. (Brit. No. 11,270 of 1908.)

Personals

Mining and metallurgical engineers are invited to keep THE ENGINEERING AND MINING JOURNAL informed of their movements and appointments.

T. A. Rickard is in New York and sails for England on May 29, where he will reside in future.

W. M. Brewer, of Victoria, B. C., is convalescent after a serious illness of several weeks' duration.

Major R. G. Edwards Leckie, of Sudbury, Ont., has been visiting the British Columbia coast cities.

J. P. Varian is engaged in examining properties in the Cobalt district, Ontario, for a New York syndicate.

George L. Fraser, manager of the Royal Collieries, Ltd., of Lethbridge, Alberta, is spending a vacation in eastern Canada.

E. G. Spilsbury, consulting engineer, will return to New York about June 1, after an absence of four weeks in Mexico.

Frank Jenkins, assistant manager of El Oro Mining and Railway Company, El Oro, Mexico, has gone to England to pass several months.

W. Rowland Cox, of Spurr & Cox (Inc.), is examining mines in northern Mexico for the American Smelting and Refining Company and other interests.

J. Parke Channing and J. A. Lewisohn were at Phoenix, B. C., recently, looking over the Dominion Copper Company's properties. They went thence to Vancouver.

Kezdiek Smith has been appointed manager of the coal mines of the Vinton Colliery Company at Vintondale, Penn. He succeeds Charles L. Hower, who has resigned.

Charles M. Porcher has withdrawn from the firm of Pierson & Co., and will have charge of the eastern business of the Pittsburgh Steel Company, with office in the Singer building, New York.

Pope Yeatman and Charles K. Lipman have been elected directors of the Guggenheimer Exploration Company to fill vacancies caused by the resignation of Robert Guggenheim and A. Chester Beatty.

John Hopp, the largest hydraulic placer gold operator in the Cariboo district of British Columbia, has gone to Barkerville to prepare for the ensuing season's mining after having spent the winter in Coast cities.

W. H. Trewartha-James, general manager, W. J. Watson, smelter manager, and J. W. Bryant, mining engineer, all of the Tyee Copper Company, recently paid a short visit to the Queen Charlotte islands, British Columbia.

Oscar A. Knox, lately general manager of the Octave Mining Company, Octave, Arizona, has sailed from San Francisco for Sydney, N. S. W., on his way to Western Australia, where he has a professional engagement.

Rex Taylor, recently assistant superintendent of the Kerr Lake mine, Cobalt, Ont., has been appointed manager of the Right-of-Way mine in place of Joseph Houston, who recently resigned to take charge of the Bonsall.

E. Knudsen, inventor of the well known copper-smelting process, who has been general manager at the mines at Sullitjelma, Sweden, has resigned that position to accept the general management for the Mitterberger Kupfer Aktiengesellschaft, at Ausserfeldten, Salzburg, Austria.

Prof. Henry Mace Payne, of West Virginia University, will sail from New York on the "Minneapolis" July 17, and will return in September. He intends to visit as many representative mines as possible in England, Wales, Belgium, Germany and France to study conditions there.

A personal item that appeared in the JOURNAL of May 8 to the effect that M. K. Rodgers, of Seattle, is about to enter upon the management of the Nickel Plate mine at Hedley, B. C., was incorrect. As the item came from an accredited and generally reliable correspondent, we had no reason to doubt it.

W. A. C. Pape has resigned his position as resident manager with the Metallic Alloys Company, to take effect June 1, after having designed, built and put into successful operation a dry grinding mill for the treatment of manganese ores, as well as a small smelter for the manufacture of manganese copper. His address will be Elkton, Va., until June.

Obituary

Jacob E. Ridgway died in Philadelphia, May 12, aged 84 years. He was a coal operator in the western part of Pennsylvania for many years, and opened mines in Cecil township, Washington county, which were the first in that district. Some years ago he sold his mines to the Pittsburgh Coal Company, and retired from business.

Societies and Technical Schools

Colorado School of Mines—The Legislature of Colorado has appropriated \$75,000 for an experimental ore dressing and metallurgical plant for this institution. Frank E. Shepard, president of the Denver Engineering Works Company, has been selected as consulting engineer for the installation of this plant.

American Chemical Society—The summer meeting of the American Chemical Society will, as already announced, be held in Detroit, Mich., June 29, to July 2, inclusive. The meetings of the sections and divisions will be held on June 29 and 30, and on July 2. On July 1 the members will visit the University of Michigan at Ann Arbor, where they will be the guests of the university for the day, returning to Detroit in the evening for the usual banquet.

Engineers' Society of Pennsylvania—A convention has been called, to be held at Harrisburg, June 9-11, for the purpose of completing the organization of a State society, to include all classes of engineers. Several hundred members of the engineering profession in its several branches, residing in various parts of Pennsylvania outside of Harrisburg, are already interested in forming an association for the purpose of holding annual conventions in the State. This association operates within the charter of the Engineers' Society of Pennsylvania, which now has a club house in Harrisburg.

American Institute of Chemical Engineers—A preliminary program has been issued for the semi-annual meeting, to be held at Brooklyn, N. Y., June 24-26. Among the papers promised for this meeting are the following: "The Utilization of Low Grade Fuels in the United States," O. K. Zwingenberger; "Creosote Oil from Coal Gas Tar," Dr. J. P. Sadtler; "Automatic Acid Egg," Richard K. Meade; "Some Experiments on Case-hardening of Steel with Gases," Dr. J. C. Olsen; "New York Metropolitan District as a Center for Great Industries," Dr. C. F. McKenna; "Methods of Clay Control," J. G. Dean.

Appalachian Engineering Association—At the meeting of this association, at Roanoke, Va., May 8, Mayor Cutchin made the address of welcome, to which Dr. I. C. White responded in behalf of the association. The balance of the morning session was devoted to the transaction of business. At the afternoon session Prof. L. S. Randolph read a paper on the "Water Power Possibilities of the South." The paper was discussed by Dr. White and others, and was followed by Capt. Baird Halberstadt upon "Recent Research in the Origin of Coal." The address was profusely illustrated with micro slides and an extended discussion of the coal origin problem ensued. F. H. La Baume then addressed the meeting. At the evening session Dr. Frank A. Wilder read a paper on "Properties and Uses of Mineral Gypsum," which was discussed.

Major William N. Page sent a paper on "The Organization and Engineering Difficulties of the Virginian Railway." The last paper was by M. M. Caldwell on the "Lead and Zinc Ores of Southwestern Virginia."

News of the Industry Reported by Special Representatives at San Francisco, Butte, Denver, Indianapolis, Salt Lake City, Goldfield and London

REVIEWS OF IMPORTANT EVENTS

San Francisco

May 22—While there is trouble at the Mother Lode properties at Jackson and other points in Amador county, over the new eight-hour law, several mines having quit work for the present, and there are similar difficulties in Tuolumne and Calaveras counties, yet the advent of the law has not produced the difficulty expected. The California branch of the Western Federation of Miners has been in session and the California Miners' Association has had a meeting in this city, yet there has been no very positive action by either of these bodies. The mine operators continue firm in the stand they took at the meeting two weeks since, which has been reported in these columns, and will insist that the eight hours means work "at the face" not from the time the men come to the shaft or tunnel. When this proposition has been rejected the mine has quit work notwithstanding the protest of the local miner's union. As a result, several important mines are for the present idle. A test suit will shortly be brought. The mine operators consider the new law to be unconstitutional and on the advice of the attorneys will contest it. There is, however, considerable unrest in the mining districts of the State and a great deal of uncertainty as to the outcome. If the law is finally enforced a number of low-grade properties on the Mother Lode and elsewhere must close down.

The Lassen Mining Company, of Hayden Hill, Lassen county, is about to resume operations after a shut-down of two years. After purchase of the properties it seems that one claim, into which the valuable vein was pitching, had a cloud on its title owing to defective probate proceedings. The company thought it was being "held up" and sooner than pay the price asked, quit work. As this is about the only productive mine in the county it will be good news to hear that it will soon be in operation again. There is quite an extensive plant on the property.

The Sixteen-to-One mine at Alleghany, Sierra county, still continues to hold the attention of mining men, owing to its phenomenal production in such short time and the fact that, thus far, there has been no end found to the productive ore shoot in the tunnel. Exceptionally high-grade ore continues to be taken out. The mine is owned by one man, E. H. Wilson, who has nothing to sell, and who is an experienced miner. He is not given to secrecy, but is willing that the information

he has may be made public for the benefit of others in the same locality. He believes in legitimate mining and is carrying it on as he may well afford to. It is a noteworthy fact that notwithstanding the discoveries in this mine, the Tightner and others near Alleghany and Forest, in Sierra county, so far not one stock-selling company has been organized, though many hundreds of men have been attracted to the locality and are at work there. One man who was grubstaked in that section, while hunting for quartz, found unlocated placer ground from which he took \$6000 worth of nuggets in a few weeks. In fact that region was formerly best known for its gravel deposits, most of them deep, and requiring drifting, though some surface gravels exist also. The county is one without railroads and has been neglected for some years. Its neighbor, Plumas county, is in the same fix as regards inaccessibility but now that such rich mines have been disclosed, access of population will mean much more vigorous prospecting of the mountain ranges.

The old Kenosha mine at Grass Valley is being reopened and unwatered. Some time since operations were commenced and then stopped but Geo. W. Root, the manager, has seen the stockholders in Kenosha, Wis., who are now willing to advance the funds. The plant is in good condition and retimbering the mouth of the shaft is being done.

Work has been started on the Banner Ridge Drift Mining Company's property near Banner Mountain, Nevada county. Machinery has been placed on the ground ready for future work. In past years many large nuggets have been taken out in this locality.

The Ocean Star mine in Washington district, Nevada county, owned by W. D. Cooley, has been bonded by E. C. Reed, of San Francisco, and the first payment made. There are two crosscut tunnels and a shaft on the property but more systematic developments are now to be made and hoisting works, mill, etc., will be put up. At the end of the 285-ft. tunnel a drift has been run in the face of which is a 6-ft ledge carrying free gold.

The old Gold Bank mine at Forbes town, Butte county, which for many years was a large producer but which was closed down a few years since, has been bonded to responsible men who are to reopen it. Some other mines in the same district are also to be reopened this summer.

The Chamber of Commerce of Sacramento, is about to arrange rather a novel exhibition of the resources of the county for tourists and visitors from the Eastern States. Gold bearing soil is found near Folsom, and a few acres are to be laid off with a miner's cabin and miners in charge, so that visitors may have a chance to pan out some gold for themselves.

Skidoo, one of the new camps in Inyo county, had rather a hard time of it at first, but is now coming to its own. The big Skidoo company has its mill working now not only on its ore but that of leasers as well. No renewals of leases are being given. A number of "outside" mines with from two to four men at work are also producing. The Cashier is installing a 5-stamp mill. The leases on the Cocophal ground are turning out well. Some new mills are to be built and a number of 12-mule teams are hauling freight.

Butte

May 19—A number of stockholders of the Davis-Daly Copper Company have recently protested against the refusal of the company to receive delinquent payment of assessments on the stock. The directors are firm in their stand that failure to meet the last assessment means forfeiture of the stock to the underwriters. It is possible that some legal action may be taken by the dissatisfied stockholders. The annual meeting of stockholders of the East Butte company will be held on June 7, at Phenix, Ariz.

With the recent strike of copper ore in the Black Rock mine of the Butte & Superior company, interest in other of the smaller companies in the camp is reviving. Several of these continued to operate throughout the hard times, among them being the Tuolumne, East Butte Extension and Butte & Balaklava. A number of those that were unable to keep going during the financial depression are now making preparations for resuming. At the Ophir mine the Butte Central Copper Company, successor to the Butte Central & Boston Copper Corporation, is making ready to start sinking within a few weeks. The shaft is now down 500 ft. Upon the results shown by the Butte & Superior properties will depend the future of many of the smaller concerns, among them being the Butte-Milwaukee, Butte & London and Raven companies.

Denver

May 21—Of the many rotary rock-boring machines for driving tunnels without the use of explosives now under consideration and construction, four which have made working tests have so far proved total failures. What is most regrettable is that the projectors of some of these unproved machines are advertising them widely and selling stock in them; in fact, they are exploiting the credulous public at the same time as the inventions. As regards the merits of them all, it would seem on general principles that it is folly trying to make a steel cutting head stand all the stress and do all the work of chipping out a 6- or 8-ft. diameter heading of solid rock for, say, 4 ft. in length at a time, when a round of small holes drilled and a charge of powder will blow it out at one shot. So far, however, the contentions in an article published in the issue of the JOURNAL of Nov. 23, 1907, have been fully sustained.

Much speculation is rife here as to the object of the late visit of John D. Ryan, president of the International Smelting and Refining Company, and his conference in Denver with the vice-president of the company, Dennis Sheedy. It is stated in the daily press here that they will establish a smelter in this State, but thus far there is no definite assurance that such is their intention.

Incidental with the withdrawal of lands in the Gore range by the reclamation service for irrigation purposes, is a long stretch of rugged, mountainous country, extending for to miles from Gore to Radium, on the Moffat road, that cannot possibly be reclaimed, irrigated, nor cultivated, but which is valuable for deposits of mica, limestone, lithographic stone and lodes of metalliferous ores. This action is in line with that of placing lands in the forest reserves which are devoid of trees, and is retarding the development of the mining industry and working a hardship on the State.

There is much satisfaction among the tungsten miners of Boulder county over Senator Guggenheim's amendment to the tariff bill, providing for a 15 per cent. duty on tungsten ore, and the statement that it will be accepted by the committee. It is stated that in 1907, Boulder county produced about 1200 tons of tungsten ore of an estimated gross value of half a million dollars. Last year, however, the panic and the falling off in the steel trade, knocked the bottom out of the tungsten mining industry in this State. It bids fair now to be revived again. The producers here state that there is hardly any profit in mining tungsten ore at less than \$6 a unit. Boulder county tungsten is always in special demand by the manufacturers of steel, on account of being freer than any other from the heavy sulphides and oxides of iron, lead, zinc, arsenic and other impurities.

In Grand county, a discovery of very rich gold ore is reported from the foothills of the Gore range, 14 miles north of Kremmling, on the Moffat road. The country has been staked for miles.

In the deep drainage tunnel at Cripple Creek, on May 17, one man was instantly killed, and five seriously injured by an explosion of dynamite, caused by drilling into a missed shot. This is the first serious accident of the kind on this work.

At Stratton's Independence, over 80 men are engaged in surface leases. The whole of the ground on the outcrop of the various veins is completely covered, and much of the ore obtained is simply yellow clay, with gold contents varying from \$10 to \$50 per ton. In some places the lessees are down to the solid rock of the veins, and are finding bunches of very rich ore. It is currently reported that the monthly shipments from this extraordinary development of surface deposits varies from \$15,000 to \$20,000. In addition to this discovery, pay ore has recently been struck in the Washington vein, 300 ft. south of the main shaft, at a depth of 700 ft. from the surface. This is entirely in the granite. The ore shows calaverite and is in an altered granite matrix along and on each side of a shear zone, and is the first pay found in granite in Stratton's Independence. It is regarded as an important discovery and may lead to the development of a new mine.

Indianapolis

May 24—The Hungarian and Polish coal miners in the Jasonville district of Greene county have appealed to James Epperson, State mine inspector, for relief from what they declare to be the failure of the peace officers to protect them against riot, and the failure of the prosecuting attorney to bring proceedings against the rioters in the district who drove the foreigners from their homes. Mr. Epperson has taken the matter up with the attorney general and the governor; the latter has instructed the prosecutor to bring the matter to the attention of the grand jury. Complaint has also been made to the French Consul who likewise has demanded of the governor that the wrongs be redressed.

The trouble at the mine at which the ejected men were employed arose from charges made by the American miners that favors were being shown the foreigners, and that more work was being given them than could be procured by the native miners. A concerted movement was started which resulted in an attack upon the homes and camps of the foreigners and they were driven from the district, many leaving their household effects. They were fired into and they returned the fire, a number being injured on each side. The last legislature attempted to pass a law to prevent the invasion of the foreign miner but the bill failed.

Salt Lake City

May 21—The Bingham Construction Company, the company organized to operate the Mascotte tunnel enterprise at Bingham, has placed an order for 40 steel ore cars, weighing approximately 160,000 lbs., to be used in transporting the ores of the Ohio Copper Company from its mines to the concentrating plant at the mouth of the Mascotte tunnel. The cars will have a capacity of 105 cu. ft., each, and the present order is only one fourth of the number that are to be placed in commission.

The annual meeting of the Silver King Coalition Mines Company was held in Salt Lake last week. The old board of directors and officers were reelected without opposition. In his report, Engineer Charles P. Brooks estimated the developed ore reserves at approximately 130,000 tons. The shipments of crude ore and concentrates during the year amounted to 31,952 tons. This product sold for \$1,345,000. Dividends amounting to \$744,300 were paid and the rest of the money goes to operating expenses and additional surplus.

Section 41 of a circular issued by the commissioner of the general land office at Washington, and approved March 9, 1909, contains a ruling on the interpretation of the general mining laws that will vitally interest claims owners seeking to obtain patents. The Silver Shield company at Bingham, recently made application for patent on several claims and has had this new ruling brought to its attention. According to the new ruling, after a mining claim has been located, and before the owner can obtain a patent he will be required not only to prove that a lode has been discovered in the claim, but he must trace it out by actual work clear through the claim or claims sought to be patented. That done, he may concentrate his \$500 worth of work for each claim, or remaining portion of it, at one point if he so desires. A strict enforcement of the new rule will mean that not many groups of mining claims, as such, will ever be patented again. It is not often that a ledge can be readily traced through a mining claim after its discovery on the surface and to expose it over the length of a group of claims would entail work that few men or companies would be capable of performing without loss of much time, and in some instances tremendous and unnecessary expenditures of money. In cases where companies and individuals locate on a lode and then take up additional claims to avoid encroachments from possible neighbors, the ruling will be a decided blow. It is not uncommon, after a vein has been located, or a discovery has been made, to locate a number of flanking claims without regard to whether they contain veins or not, but to head off possible litigation that arises so readily under our present mining laws.

The concentrating mill run in connection with the United States Smelting

Company's smelter at Bingham Junction will undergo a number of important changes to adapt it better to the concentration of Bingham ores. New features will be a regrading plant and provision for electrostatic concentration of the zinc. The latter product will be shipped to zinc smelters in Kansas, except such portion as will be required by the company's process of making zinc oxide for neutralizing the acid in the smelter gases.

A deposit of a peculiar clay called "wonderite" that exists near Modena in Iron county is being mined for commercial purposes. The clay is soft and plastic but when it sets it becomes hard and will take a high polish exhibiting varied colors. The raw material is being bought by Salt Lake jewelers.

The new Utah Stock and Mining exchange was launched on May 18. Speeches were made by a number of prominent mining men in which they told of the field for a new exchange in Salt Lake. At the first formal call quotations were made on a large number of stocks nearly all of which are listed on the old exchange. During the opening day and the few succeeding days the trading has been good.

During the week ending May 14, the output of the Tintic mines comprised a total of 194 carloads as follows: In 50-ton cars, Ajax, 1; Bullion-Beck (leasers), 2; Centennial Eureka, 44; Eagle & Blue Bell (leasers), 1; Grand Central, 4; Mammoth, 14; Sioux Consolidated, 14; Victoria, 2; Yankee Consolidated, 2; in 20-ton cars, Brooklyn, 6; Black Jack, 3; Beck Tunnel, 4; Dragon Iron, 31; Colorado, 19; Iron Blossom, 37.

Goldfield, Nevada

May 20—The deal for the change in control of the Rawhide Coalition and the Rawhide Queen Mines Company, with a view to securing for the Rawhide camp a \$300,000 railroad and a million-dollar mill at Walker lake has failed to go through.

From a willingness expressed by Charles W. Reed, president of the unfinished Rawhide Western Railway, to dispose of all the roadbeds which he put down between Walker lake and Rawhide, at an expense of about \$75,000, it appears that the crucial reason why the deal did not go through was that there was no excuse nor necessity for the construction of the Rawhide Western railway. When the railroad was projected, it was the opinion of mine and mill operators that the only economical solution of the mill problem at Rawhide was to erect a large mill at Walker lake, 25 miles away, and transport the ores there for reduction. Recently, three experimental mills were erected in Rawhide, and all of these have been operated with success.

An unlimited supply of water has been struck on the flat, five miles south of Rawhide, and an underground lake discovered

Water is now being supplied faster than it can be utilized. The water question has been entirely solved in this way, and the water at Walker lake is not needed for milling.

The only question for the mills now to solve is that of fuel. The experimental mills at Rawhide are now using gasoline for power, all of which has to be transported across the desert by mule teams from the railroad station at Schurz, 25 miles away. Electric power companies, which are now supplying Nevada cities, have been examining into the Rawhide situation and offer practically unlimited electric power at \$25 per horsepower. This eliminates the railroad proposition entirely.

London

May 15—At this season of the year there is a flood of annual reports coming from South Africa, the majority of the companies making up their accounts to the close of the year. The last year has been one of progress and most of the companies are able to show increased profits and to promise still further improvement in the future. Owing to the fall in working costs the ore reserves show in most cases a substantial increase, large tonnages formerly treated as unpayable now being classified as assets. The companies as a rule are liberal as regards the information given about the mine and the finances, but in one respect this is hardly the case and that is regarding the life of the mine. The numerous amalgamations that have been carried through in the last 12 months have made in many cases the life a subject of small importance. But there are still existent a fair number of mines that are nearing exhaustion, and in such cases more information as regards the date of exhaustion than is usually given appears wanted. Shareholders in the old established mines up to the present have had the satisfaction of being informed from time to time that the lives of their mines have been underestimated in the past. The reduction in working costs has completely altered the situation, and new reefs considered unpayable in the past are found to be workable, although, of course, the profits to be won in the future cannot be expected to compare with those in the past.

As examples of these extensions of life arising out of the altered conditions may be mentioned such companies as the Salisbery and the New Primrose. The Salisbery mine was one that was a short time ago considered near the end of its tether, but owing to a recent valuation has suddenly been given a further six-years' lease of life. There are no doubt difficulties in estimating how long a mine may last and the uncertainty of the past perhaps accounts for the dislike of directors and engineers to make estimates of life for fear that

they may again make a bad shot. This is hardly, however, a valid excuse for leaving the subject alone, and it is due to the shareholders to have the best information available as to the remaining time that they may expect dividends.

The report of the Ferreira contains a paragraph that calls for special attention, as it indicates the adoption of a policy that appears certain to receive criticism. The paragraph referred to states that the directors have retained a large cash balance in view of the comparatively short life of the mine and the possibility of entering into fresh business for the prolongation of the company where immediate cash might be required. This points to an amalgamation with another neighboring mine, or to the investment of part of the profits of the company in a new mine. Whether the shareholders will agree to the directors speculating with the profits earned remains to be seen. It is a new departure and one to which the shareholders might reasonably take exception. Their capital is invested in a particular mine and by right the profits earned should be distributed and not a portion only on a standard fixed by past results as is the case now. Most shareholders would prefer to have the control of the profits in their own hands and select their own investments. The Rand Mines, Ltd., have also announced that some of the funds of the company are to be devoted to taking up fresh business should a favorable occasion arise. But the case of this company is somewhat different to the Ferreira mine, as the business of the company is largely that of a finance company, and it, therefore, stands on a different footing. There seems to be a desire on the part of those who control the Rand to prevent the extinction of companies or rather the extinction of shareholders, and this is to be effected either by the process of amalgamation, or by investing the profits in a new undertaking. Of these two processes the former seems the more legitimate. Indeed, it is questionable whether the second process is legitimate at all.

An exhibition of a new form of tube mill was given recently to a party of engineers by Fraser & Chalmers at their works at Erith. The tube itself is similar to the tubes now in use and the novelty consists in the alteration of the motion given to the tube which is attached to the trunnions not at the central axis, but off the center, so that the tube itself has an eccentric motion. By this means greater motion is given to the pebbles, and pulp within the tube. It is claimed that this arrangement increases considerably the efficiency of the machine. Tests are being conducted to determine the most advantageous degree of eccentricity, and it is proposed later to send out the machine to South Africa where its capability can be tested alongside a tube mill of the ordinary type.

Mining News from All Parts of the World

New Enterprises, Installations of New Machinery, Development of Mines and Transfers of Property Reported by Special Correspondents

THE CURRENT HISTORY OF MINING

Alaska

SEWARD

The Alaska Central railway is rushing construction work to the coalfields of the Matanuska and Chickadeo, which are among the most important coal measures ever discovered in Alaska, there being wide seams of coal of a high-grade character. The government will maintain a naval coaling station on Resurrection bay within easy reach of the Alaska Central road. The site has already been approved by the Navy Department.

Arizona

COCHISE COUNTY

Arizona Gold Mines and Milling Company—The annual report shows that 600 ft. of tunnel work were done during seven months' operation last year. As soon as the power plant is equipped for oil-burning, operations will be continued.

Hilltop—A recent shipment of 15 tons of ore to the El Paso smelter gave returns of \$40 per ton, net.

GRAHAM COUNTY

Shannon-Arizona Railway—Articles of incorporation were recently filed. The company expects to begin work on the proposed line from Clifton to Metcalf and bids for grading, blasting and tunnel work have been asked. Surveys have been completed. The line is 10 miles long, but will require excavations as follows: 100,000 cu.yd. solid rock; 7000 loose rock; 40,000 earth, and a 900-ft. tunnel.

Shannon Copper—Regular shipments are being made from this company's Copper Belle property at Gleason, Cochise county. Development work is being carried on at the Greenlee group near Clifton.

Detroit Copper—Judge Campbell, of the District Court, has set aside the \$4000 verdict which was returned in the case of Hoefeld vs. The Detroit Copper Mining Company. This is one of 38 actions brought against the company by residents of Clifton, who claimed that the bursting of the company's dam caused them damage aggregating \$250,000.

Misabi-Morenci Development Company—Articles of incorporation were recently filed by Dick Lakenau and associates. The company is organized to develop mining claims in Gold gulch between Morenci and Eagle pump.

Morenci Water Company—A new power house has been erected at the Eagle creek pump station.

Boutta—A short time ago a Mexican found three nuggets which he sold for \$175. The gold was found near the mouth of Bonita creek. Development work shows the property to be of some worth, and a small plant is being operated with fair results.

California

AMADOR COUNTY

Defender—A new cyanide plant is being installed to work the tailings.

BUTTE COUNTY

Kentucky Ranch—The first clean-up of the new dredge has been made with satisfactory results.

Dargin—This old mine was recently incorporated by Los Angeles men. Preparations for working the property on an extensive scale are being made.

Gold Channel Dredging Company—This company was organized at Oroville by Los Angeles and Redlands people with the intention of working dredging lands near Oroville.

CALAVERAS COUNTY

Lloyd—The mine at Central Hill was sold at sheriff's sale to Arthur Jackson for \$27,000. Mr. Jackson had obtained a judgment against the former owners, the Ophir Mining Company, for injuries received at the mine.

Reiner Mining Company—Electricity will be used for power in place of steam, as originally planned.

EL DORADO COUNTY

Mount Pleasant—A loan of \$20,000 has been made with which to reopen the property, which has been idle for a year.

Morey—This mine, owned by Mrs. E. F. Morey at Grizzly Flat, is now producing. It has a three-stamp mill and power hoist. The ore is high grade.

Grainger—Numerous valuable nuggets are being taken out. They are found in a surface layer of decomposed granite which only covers the bedrock to 18 in. depth.

Lucero—At this property, S. W. Collins, superintendent, the showing on the 400 level of the Alpine is encouraging.

INYO COUNTY

Custer Consolidated—This company has been organized at Turlock to operate mines in the new district of Custer now being opened by N. O. Hultberg, of Turlock.

Pine Mountain—This group, owned by

Heiskell, Wyatt, Davies and others has been placed under bond to Salt Lake City men. These are gold-silver-lead claims.

KERN COUNTY

Amalie District—The Amalie mine is being operated by Rogers Brothers. A new company is about to take hold of the Zenda mine and reopen it. The Gold Peak company has not been operating lately.

MARIPOSA COUNTY

Ruth Pierce—This mine, near Hornitos, has been started up again, and the stamps are dropping on good ore.

Washington—This mine, in Hornitos district, one of the deepest in the county, is about to be sold to New York men. One shaft is 1600 ft. down.

MONO COUNTY

Snow Drift—McCarthy & Barnett have taken a lease on this mine, formerly the Booker, and will immediately commence work.

NEVADA COUNTY

American Mining and Development Company—An electric-light plant, compressor and drills have been purchased. The ditch was rebuilt. It is expected to upraise from the tunnel to the gravel channel in a few weeks.

Central Consolidated—Another strike of rich ore was made at Banner Mountain. It is supposed to be a continuation of the orebody found last month, only further south.

Norambagua—The heirs of the late Mr. Gilbert have decided to continue work and it will not be closed down as announced.

Oustomah—Frank M. Evans, manager, has started the 10-stamp mill on \$40 ore.

PLUMAS COUNTY

Old Harry—In this mine, one of the Crown Point group near Quincy, Geo. McCall has found a small rich vein.

Colorado

LAKE COUNTY

Cleveland—This property is shipping 120 tons daily, the ore coming from the fourth and sixth levels. The crosscuts driven at the bottom of the shaft, 825 ft., to open the fissure vein north and south, are now passing through the parting quartzite.

Iber—Lessees on No. 4 shaft of the Little Jonny, have encountered high grade gold ore at the 1200 ft. level, the body as

far as developed, shows six feet of ore at the breast. The mine is shipping in the neighborhood of 7000 tons of different classes of ore per month.

Garbutt—A body of lead sulphide ore has been opened close to the Little Jonny. Daily shipments of 35 tons are being sent to the smelter.

Castle View—Arrangements are being made for the resumption of work. The same interests will also operate the Big Chief and Evelyn and all will be worked through the Castle View shaft. The properties contain lead and iron ore.

Chrysolite—Lessees are shipping 30 tons daily from a body of iron-silver ore, recently opened in the lower levels of this old Freyer hill property.

Yak Tunnel—Fifty feet from the breast of the bore, a crosscut has been started toward the Fortune grounds. Three shifts are working with machine drill and it is expected that within six weeks connection will be made. The breast of the tunnel is now approaching the New Monarch territory.

Hibschle—Bennet & Harris, who have a lease on the Coronado, have taken hold of the Hibschle property and will work it from the Coronado.

Dinero Tunnel—Connections have been made with the old shaft from the tunnel level, and within a short time all of the old workings will be drained of water, permitting the company to work the ore that was left there by the former owners.

Pyrenees—New pumps have been installed and are now raising water from the lower levels of this property on Iron hill.

Star of the West—Operations have continued on this property on Iron hill during the winter, though shipments have not been so heavy owing to the fact that much attention was devoted to development work.

Iran Silver—Work of installing the aerial tramway on Iron hill has been started.

Lackawanna Gulch—With the opening of spring, interest has been renewed in the Lackawanna gulch and many miners and prospectors are directing their attention thither. The ore of this section is gold bearing.

Georgia

WALKER COUNTY

Pigeon Mountain Iron Company—This company, recently organized, has bought from E. M. Jones, of Chattanooga, Tenn., a tract of 3500 acres on Pigeon mountain, just south of the Tennessee line. The land contains three workable seams of iron ore, and the company intends to begin work at once on development; also on a spur to connect with the Chattanooga Southern and the Central Railroad of Georgia. The officers are: President, Joseph C. Haas, Montgomery, Ala.; vice-

president, R. E. Watson, Atlanta, Ga.; secretary and treasurer, Edwin Haas.

Idaho

SHOSHONE COUNTY

Snowstorm—Ore shipments during April were made at the rate of 200 tons per day. This has been increased to 300 tons daily. The third dividend for the year was paid this month amounting to 3c. per share, or \$45,000.

Orofino—It is reported that a 5-ft. vein of galena was recently encountered. The ore carries some silver.

Cuba—The main adit is in a distance of 630 ft., and has gained a depth of 350 ft. Lead ore has been encountered at this point.

Hecla—The annual report for 1908 was recently issued and states that during the year 76,586 tons of ore were extracted. Gross value, \$569,805; cost of extraction, \$233,136; cost of transportation and reduction, \$193,146; cost of repairs, \$34,723; net profits for the year, \$108,799.

Cocur d'Alene Powder—An injunction has been issued by the District Court preventing the rebuilding of the plant which was recently destroyed by an explosion.

Indiana

PIKE COUNTY

The Pure Oil Company is piping large quantities of oil from the Muran field and has begun the work of sinking additional wells nine miles south, where a new field has been discovered.

SULLIVAN COUNTY

The government experts sent from Pittsburg equipped with protective apparatus have, after a week's work extinguished the fire in the Keystone mine and the mine is now banked. They were able to live in the thick fumes and do effective work. There is little doubt that this experience will hasten the establishment of such a life-saving station in the Indiana coalfield.

VANDERBURG COUNTY

The coal mines near Blackburn in this county—three in number—began operation this week after a suspension since the middle of January. These mines will give employment to several hundred men.

Michigan

COPPER

Oneca—At the annual meeting of this company held recently the following directors were elected: John D. Cudahy, of Calumet, president; John Brooks, of Boston, secretary and treasurer; William F. Fitzgerald, George W. Towne and John C. Watson. Extensive exploratory work will be carried on during the summer under the direct supervision of John L. Harris.

Ojibway—Sinking has been resumed at No. 2 shaft 90 ft. below the 800-ft. level. The crosscut is approaching the lode No. 1 shaft, where sinking is suspended while the station at the 800-ft. level is being cut. The lode at this point lies in close proximity to the shaft. This company is gradually opening up good ground and will soon be in a position to maintain regular shipments.

Lake—This company has reached the fourth level in its shaft, a distance of 600 ft. from surface and a station is being cut preparatory to starting the level. At the third level the drift north is in about 75 ft. and is in ground carrying small mass and good stamp copper. The width of this lode has not yet been definitely determined, and it is planned to rig up a drill underground to ascertain its width instead of crosscutting through it.

Winona—It has been definitely decided to erect the stamp mill, which is to be owned jointly by this and the King Phillip Company, and actual work will be started in a day or so. This mill is to contain two heads and will be capable of handling about 1500 tons daily.

Superior—This company has reached the eleventh level at its No. 1 shaft and a crosscut started to cut the lode. Openings are being extended from the level above and good ground is being blocked out. Rock shipments of about 100 tons daily are made to the Atlantic mill. No. 2 shaft is being equipped with the hoisting and compressor plant that did service at No. 1 shaft.

Isle Royale—The shaft on the Baitic lode is temporarily bottomed at a depth of 400 ft. There is a gradual change in the character of the rock-formation as depth is obtained, the rock now resembling that opened at the Superior property.

Hancock—Sinking continues at this company's vertical shaft at a depth of 1600 ft. At the fifteenth level the large working crosscut that is to handle the rock tributary to No. 1 shaft, is approaching the point where it will be intersected by the winze that is being sunk from the thirteenth level of No. 1 shaft. It is planned to establish levels at intervals of 100 ft. and work the ground down to this crosscut, which will be handled and hoisted at No. 2 shaft.

Mohawk—This company will begin the sinking of its new, or No. 6 shaft at once. A diamond drill hole was put down to test the overburden, encountering the Kearsarge lode at a depth of 200 ft. and showed the lode to be about 15 ft. wide and with the average copper content.

Minnesota

IRON—VERMILION RANGE

Section 30—No. 2 shaft at Ely, which was started 460 ft. from the old Shagawa shaft, has struck an orebody which ap-

pears to be of large size. Drifting and crosscutting have not yet reached the boundaries.

Missouri

JOPLIN ZINC-LEAD DISTRICT

Conqueror—A new tailings mill has been built to run the large pile of rich tailings that have been accumulating for a number of years.

Cock Robin—Operations have been resumed. A new mill has been built and good ore is being hoisted.

Jack Pot—This mine in Chitwood has started work on the John Jackson land.

Continental—This company is subleasing some of the lots on its Prosperity 40 acres. The sublessees will work the upper runs.

Lucky Budge—Labor troubles caused a shut down at the mine.

Lincoln—This mill has begun production at its mine north of Duenweg.

Kitty Mack—This company is operating on the Schifferdecker land west of Joplin and has 18 ft. of disseminated ore in 10 drill holes at 175 ft. depth. A 200-ton mill will be erected when development is further advanced. Z. J. Sheridan, of Joplin, is manager.

Lincoln—This company, near Duenweg, is installing Richards pulsator jigs in its new mill.

Louisville—This company has purchased the Big Fly mill and is moving it to its mine near Belville. Ed. Mallet is manager.

Sawyer—A new mill is being built on the lease on the Rex land, east of Joplin.

WAYNE COUNTY

St. Francis Iron and Land Company—As a result of a number of test pits and borings development work is to be begun on a large tract of iron-ore land. A contract has been let for a washing plant. The company's office is at Greenville, Mo. James W. Van Dolan is president; C. P. Scrogin, secretary and treasurer.

Montana

BUTTE DISTRICT

Butte & Superior—The management states that the recent strike was made on the 1,400-ft. level at a point about 100 ft. west of the shaft. Drifting has been done for 50 ft., and the indications are that the vein is over 10 ft. in width. A recent assay shows 14½ per cent copper, 30 oz. silver and \$2 gold per ton. The ore shoot dips to the east, thus indicating that its continuation will be found east of the shaft at a greater depth.

BROWNSVILLE COUNTY

Ohio-Keating Gold Mining Company—This company has recently been organized by George M. Bourquin, W. R. Kirk and F. G. Goggin, of Butte. The company will have a capital stock of \$500,000.

divided into shares of the par value of \$1 each. It is proposed to operate the Ohio group of claims, situated in the Radersburg district, near the Keating Gold Mining Company's property.

JEFFERSON COUNTY

Boston & Corbin—Raises are being run at two places in the three-compartment shaft. An air compressor and also a new hoist have been ordered, both of which will be electrically operated.

Corbin-Wicks Copper Company—At a special meeting of stockholders held in Butte last week, a plan to turn over all the property of the company to the newly organized Montana-Corbin Copper Company, was favorably voted upon. The exchange is made on the basis of 15 shares of Corbin-Wicks stock for one of the Montana-Corbin Copper Company. The properties to be transferred are the Hidden Treasure and Copper King patented quartz claims. The new company is a Maine corporation with a capital of \$750,000, divided into 150,000 shares of the par value of \$5.

Nevada

LINCOLN COUNTY

Pioche King—At a depth of 185 ft. a rich body of silver-lead ore has been encountered. The property adjoins the Prince Consolidated mine. John A. Kirby is general manager.

NYE COUNTY—BULLFROG

Montgomery-Shoshone—The monthly profits are approximately \$20,000. New machinery is being added, which will increase the capacity of the mill about 20 per cent.

Mayflower—The total returns for April operations were \$10,000 in bullion. The extraction was approximately 90 per cent.

NYE COUNTY—ROUND MOUNTAIN

Sphinx—Two separate and distinct veins of good milling ore have been encountered. M. J. Kiely is superintendent.

Jefferson—A tramway connecting the mine and mill is being built. Work on the mill is progressing rapidly.

Daizy—C. E. Johnson and associates have secured controlling interest. The company has been reorganized with C. E. Johnson, president and treasurer, and A. F. Johnson, vice-president.

NYE COUNTY—TONOPAH

Tonopah Mining—The net earnings for April, available for dividends, were \$150,000.

McNamara—An ore contract has been closed with the Balaklala Copper Company, Shasta county, Cal. Shipments amount to 200 to 250 tons per week.

Ore Shipments—The weekly shipments are approximately: Tonopah company, 350 tons; Belmont, 1000; Montana Tonopah, 900; Midway, 100; McNamara, 250; West End Consolidated, 85 tons.

WHITE PINE COUNTY

Cumberland-Ely—Daily shipments amount to about 1500 tons. Drilling has been resumed on the Puritan claim.

Nevada Consolidated—The daily ore output is approximately 3500 tons. The larger part of this ore is from the Copper Flat property.

North Carolina

CATAWBA COUNTY

Catawba Gold Mining Company—This company, operating the old Shuford mine, is striking rich ore, several thousand dollars worth of gold bullion having been shipped from the mine in the months of April and May.

DAVIDSON COUNTY

Silver Hill—This old mine, famous for its production of silver nuggets and lead ore, has been acquired by New England capitalists and who are preparing to resume operations.

FRANKLIN COUNTY

Portis—Two Overton gold placer washing machines are in operation with good results. A. J. Overton, of Salisbury, is manager.

MONTGOMERY COUNTY

Carter Mine—A cyanide plant is being erected by Claude Hafer, formerly connected with the Iola mine.

Dark Spring—This property, recently discovered, shows a belt of low-grade ore 30 ft. wide, with brown streaks that run high in gold. Ohio parties are erecting Chilean mills on the property.

Iola—This old mine, purchased by W. Fleming, of New York, is now being operated under the management of M. B. Spaulding, formerly of Guanajuato, Mexico.

Oklahoma

CRAIG COUNTY

A lead and zinc deposit has been opened up near Bluejacket, fifteen miles north of Vinita. Recently a strike of lead and zinc was made near Wagoner. The Bluejacket strike has created great excitement and there is activity in leasing lands and preparations for extensive development are under way.

Tennessee

WHITE COUNTY

Clifty Consolidated Coal and Coke Company—This new company, owned by Massachusetts people, has bought 12,000 acres of land in the Cane Forks district heretofore owned by the Clifty Coal and the Cane Fork Coal companies. The latter is still undeveloped, on the Clifty tract there is a coal mine. The Consolidated company will enlarge the mine, put in electric haulage and other improve-

ments, increasing the capacity to 1,200 tons of coal daily. E. M. Jones, Chattanooga, Tenn., is consulting engineer.

Utah

BEAVER COUNTY

Beaver Carbonate—A third shoot of lead-silver ore has been encountered at a point 415 ft. from the shaft on the 700-ft. level. The crosscut has been driven 34 ft. in ore and the hanging-wall has not been reached.

Horn Silver—A second shift has been put on at this property and in a few days the present force of 25 men will be doubled.

JUAB COUNTY

May Day—The shaft has now attained a depth of 1000 ft. and crosscuts will be run from this level to tap a large body of ore which is supposed to exist near the Godiva line.

Tintic Central—The electric hoist has been put in operation and the sinking of the shaft is now being rushed. Three shifts are employed on the work.

East Tintic District—The operators of the East Tintic district are building a wagon road from that district to Eureka. The new road will take a direct route, cutting off five miles from the present course, and will mean a great saving to the shippers in that section. The road will be completed in about one month.

SALT LAKE COUNTY

Columbus Consolidated—This mine at Alta made last week the record day for shipments since the present campaign was started. During that day 125 tons of ore were hauled to the sampler from the load ing station on Tanner Flat.

Washington

The native coal will undergo a severe test by the government vessels of the Bering Sea and Arctic patrol this year, in an effort to substantiate the claim that the domestic product is equal to the British Columbia coal which has been used for many years. The Green River Coal Company is rushing work on its new coal bunkers with the view of early production for the market. New machinery is being installed.

KITITAS COUNTY

Cle Elum-Roslyn Electric Railway and Power Company—The county commissioners granted a franchise to this company, which proposes to furnish transportation and power for the mines in the district.

LEWIS COUNTY

McCoey Creek—The company is installing a reduction plant and expects to have it in operation within three weeks.

SNOHOMISH COUNTY

Bonanza—Two miners were seriously injured by a premature blast. A short time ago George Pecola, manager, was overcome by bad air and lost his life.

Wayside—The mine is producing ore from the 850-ft. level at the rate of about one carload per week. A big flow of water has been encountered in the lower workings subsequent to the opening of the new orebodies.

Sunk District—Smith & Hanson have encountered the paystreak in their new working tunnel.

Wisconsin

ZINC-LEAD DISTRICT

Benton—The Calvert is obtaining the 100-ton mill equipment of the Hazel Green Mining Company. W. N. Smith, of Platteville, has charge of the Calvert. The Corr will replace the mill destroyed by fire last fall. A new shaft has opened up a rich vein of jack below the blanket vein of lead. A. L. Deerhammer, of Beloit, Wis., is president. The Lucky Twelve Company has purchased the Monarch mill and will remove this plant to its property on the Murphy land, five miles southeast of Benton. The Lake Superior is pumping out and will resume operations; only two cars of concentrates were turned out by the new mill when the property was closed down by the panic. The Wisconsin Zinc Company is drilling on the Alfred Grey farm, one mile west of Benton.

Platteville—The Big Four Mining Company has obtained a lease option on the Trego mine, formerly operated by the Platte Lead and Zinc Company. The 150-ton mill was purchased two months ago from the Platte company, which had forfeited its mining rights. The Wisconsin Zinc Company is moving the Royal mill to the Mitchell Hollow land. The Jarrett Lead and Zinc Company is building a 100-ton mill at St. Rose, nine miles south of Platteville. George Jarrett, of Platteville, is in charge. The Klar-Piquette Company, on May 25, pays its first dividend of 10 per cent. on \$20,000 capital. The mine is turning out 10 to 17 tons of concentrates per day, which average 50 per cent. metallic zinc; an accumulated stock of 300 tons is in bins. The St. Rose company pays a dividend of 3 per cent. May 25, on \$75,000 capital.

Canada

BRITISH COLUMBIA—BOUNDARY DISTRICT

British Columbia Copper Company—Engineers are surveying a line for a spur from the Columbia & Western railway between Elholt and Phenix to this company's Jackpot mine, in Wellington. The line will connect to the No. 7, in Central Canada, and thence to the Lone Star and Washington, and across the international boundary into the United States, being also largely in ter-

ested in both these mines. There is a considerable tonnage of ore at all three mines and the provision of transportation facilities will allow its being shipped to the company's smelting works at Greenwood.

Granby Consolidated—The Gold Drop, one of this company's group of mines in Phenix camp, is being prepared for resuming shipment of ore by about the middle of May.

Jewel—The West Kootenay Power and Light Company is extending its electric-power transmission system to the Jewel mine, Long Lake camp, where a gold-stamp mill is being erected, and in connection with which the Nichols' slimes-saving process is to be used.

BRITISH COLUMBIA—CARIBOO

E. I. West, of Horsefly, has returned from Oakland, Cal., to prepare for the ensuing season's hydraulic placer mining for gold. His hydraulicking plant, including a concentration appliance for saving the fine gold from the black sands characteristic of the district, will be installed on the south bank of Horsefly river about 30 miles from Harper's camp, where he has leased areas of gold-bearing gravels.

BRITISH COLUMBIA—CROW'S NEST PASS

The Canadian Western Mine Operators' Association has remained firm in its decision to decline consideration of any new proposals from District No. 18, United Mine Workers of America; insisting upon execution of the agreement arrived at about the end of March and afterward ratified by a majority of the miners directly concerned, but which District President Frank Sherman afterward refused to sign. After having been idle a month the men have become dissatisfied, having meanwhile learned that International President T. L. Lewis and other officials have intimated that no financial assistance may be expected from the international organization, because the local men having struck work after ratifying the agreement submitted to their vote. Now local officials have applied for a Board of Conciliation and Investigation under the "Industrial Disputes Investigation Act, 1907," known as the Lemieux Act; so there is prospect of a settlement.

BRITISH COLUMBIA—EAST KOOTENAY

Aurora—Six feet of ore, averaging about 36 oz. silver per ton and 30 per cent. lead, is showing in the face of the tunnel. The mine, which is situated across Moyie lake from the St. Eugene, is equipped with a small air compressor, steam driven.

BRITISH COLUMBIA—KASLO

Lucky Jim—Zinc ore is being shipped to the Mineral Point Zinc Company, Depue, Ill. The mine is leased to Hemenway & Loper, and G. W. Loper is in charge.

ONTARIO—COBALT DISTRICT

Ore Shipments—Shipments of ore from Cobalt for the week ended May 15 were:

Buffalo, 42,990 lb.; Crown Reserve, 108,100; City of Cobalt, 59,000; La Rose, 131,200; McKinley-Darragh, 65,370; Nipissing, 62,060; O'Brien, 63,850; Temiskaming, 60,000; Temiskaming & Hudson Bay, 64,200; total, 656,770 pounds.

Beaver—An important strike was recently made at the 200-ft. level. The crosscut in which the strike was made commences 50 ft. east of the shaft. The vein is 10 to 12 in. wide and is said to carry over 3000 oz. silver to the ton. The significance of this find lies in the fact that in spite of extensive development work nothing of value has been found in the mine on the 100- or 150-ft. levels. Diamond drilling to strike the Temiskaming vein is being continued, the drill being put down at an angle of 45 deg. It is now 125 ft. below the surface.

Hargrave—The Jacobs or No. 3 Kerr Lake vein has been uncovered on the East Hargrave property, where it is 6 in. wide. About 400 ft. of the same vein have been stripped on the South Hargrave, on which the main workings are 235 ft. down.

La Rose—A new vein found on the surface of the Lawson property running at right angles to the main vein has been stripped for 28 ft. and shows solid ore 6 in. wide carrying much native silver.

Nipissing—During April ore of an estimated value of \$149,739 was mined. Of a total of 201,629 oz. silver produced during the month 108,689 oz., or 37 per cent., came from the Kendall vein.

Chambers-Ferland—This company has purchased the Welsh claims in the Gowganda district, comprising 70 acres immediately adjoining the Bartlett property, on which some good discoveries have been made.

Dreadnought Mining Company—At a recent meeting of the shareholders of the Rothschild Mining Company, at New Liskeard, it was decided to transfer the holdings to the Dreadnought Mining Company, which is in process of organization in Montreal, with a capitalization of \$1,000,000. A force of men will be set to work at once on the property under the direction of E. C. Kingswell.

Kerr Lake—Nearly all of the 84 tons of ore produced in April, which yielded about 200,000 oz. silver, came from No. 7 workings, including the new find known as the McDonald veins. On this vein a winze has been sunk 32 ft. from the 150-ft. level.

Mexico

CHIHUAHUA

Zinc Smelter—A State concession for the erection and operation of a zinc smelter in the district of Iturbide, presumably at or near Chihuahua, has been granted to Donald B. Best and Luis F. Robinson.

Conchos Power Plant—It is reported that the newly perfected Mexican North-

ern Electric Company, of Canada, of which G. B. Greenwood, of Montreal, is president, is to shortly acquire the Ginther-Creel-Cortazar power concession on the Conchos river, about 20 miles from Santa Rosalia, and erect a hydroelectric power plant. Mr. Greenwood was in Chihuahua recently.

Batopilas—The 1908 silver production of these mines totaled 839,865 oz., an increase of 8,328 oz. over 1907. The profits for 1908 were \$57,445 as compared with \$143,111 for 1907. The yield for the first four months of this year was over 750,000 fine ounces.

Iberri—A considerable body of shipping grade lead-silver ore has been opened at this Santa Eulalia mine. The owner is Juan F. Treviño and James Gasson is superintendent.

American Smelting and Refining Company—The monthly output of this company's Santa Eulalia mines is approximately 7000 tons. Upon the completion of the two aerial tramways the tonnage will be greatly increased. The ore is sent to the Chihuahua and El Paso plants.

Globe Mining Company—This New Orleans company represented by Joseph Meyer is developing properties in the Naica camp. It is likely that machinery will be installed soon.

Santa Maria—Recently 6 cars of high-grade copper-silver-lead ore were shipped to the Copper Queen smelter at Douglas, Ariz. This property is 25 miles from Sabinal, Chih., and is under the management of Wm. G. Gruber.

Rio Plata—Operations which were suspended for several weeks in April and May on account of the water shortage were resumed recently. The cyanide plant is scheduled for its initial regular run.

Guanajuato Consolidated—The general manager reports for the month of April, 1909, as follows: The mill ran 28½ days and crushed 6984 tons of dry ore; concentrates shipped to smelter 148 tons; estimated value of bullion produced \$56,600; estimated value of concentrates \$46,600; total gross value in products \$103,200; less working expenses, including marketing of bullion and freight and treatment charges on concentrates shipped to smelter \$69,500; estimated profit 33,700 pesos. Of this 11,000 pesos have been expended on development account. Amount of development work done, 406 feet.

OAXACA

Taxiote District—Recently a New York syndicate, headed by George W. Young and W. H. Ellis, purchased eight of the largest properties, comprising the Anita Grande, Las Pitillas, Hidden Treasure, La Buena, Admiral Dewey, Ampliación, de Admiral Dewey, Gertrudis, and La Vereda. It is reported that 150-stamp mill will be installed. It will be operated by electricity and contain the latest improved machinery.

Two new mining companies were organized recently, one the Eliseo Gold-Silver Mining Company, with a capital of \$5,000,000, and the other known as the Two Brothers Gold and Silver Mining Company, with a capital of \$250,000. It is supposed that these companies are organized to operate the above-named properties.

Africa

TRANSVAAL

The gold production of the Transvaal has already been reported at 607,101 oz. fine in April, and 2,395,433 oz. for the four months ended April 30. According to the report of the Chamber of Mines, the April output was from 1,676,000 tons of ore treated, giving an average of \$7.14 per ton. For the four months the total tonnage was 6,588,856, the average per ton being \$7.18. The labor report shows that on April 30 there were 162,901 negroes and 7734 Chinamen employed; an increase of 858 negroes during the month, but a decrease of 2263 Chinese. Since January, 1907, a total of 46,094 Chinese have been sent out of the Transvaal.

Asia

INDIA—MYSORE

Kolar Goldfield—Gold production in April is reported at 46,374 oz. bullion, an increase of 90 oz. over March, and of 767 oz. over April, 1908. For the four months ended April 30 the total was 181,476 oz. bullion in 1908, and 182,179 oz. in 1909; an increase of 703 oz. The bullion reported this year was equal to \$2,489,074 or 163,961 oz. fine gold.

Australia

QUEENSLAND

Gold output in April is reported at 37,100 oz. from 52,700 tons of ore worked, and 300 oz. placer gold; a total of 37,400 oz., or \$773,058 in value.

Europe

AUSTRIA—GALICIA

Advices from Vienna report that the representatives of the Standard Oil Company have concluded an agreement with the Galician oil producers. The Standard, it is said, agrees to build a number of large reservoirs for the storage of oil, at a cost of about \$1,400,000. The annual storage charges agreed upon will be 17.5 hellers, or about 3.5c. per 100 kg. for the first four years, which will be sufficient to defray the whole cost of the reservoirs. After the expiration of the first four years the storage charges will be reduced to 6 hellers, or 1.2c. per year. The Standard further binds itself to buy from the Austrian oil combination its whole output of benzine and crude oil at an agreed minimum price of 12 kroner (about \$2.40) for benzine and 5 kroner (about \$1) for oil.

Current Prices, Market Conditions and Commercial Statistics of the Metals, Minerals and Mining Stocks

QUOTATIONS FROM IMPORTANT CENTERS

Coal Trade Review

New York, May 25—In the West the increase or improvement in the coal trade has not been checked, but continues slow. Little betterment is apparent from week to week, but if comparison is made with the corresponding period last year it is found that there has been a considerable advance. Steam coal is in better demand, but domestic trade is naturally slow at this period of the year. Car supply is good on almost all roads, and there is little or no complaint from shippers.

The Eastern bituminous trade is rather more quiet than that in the West. On the Seaboard the flurry over West Virginia coal as a disturbing element has subsided, although it may come up again at any time. The Norfolk & Western and the Chesapeake & Ohio seem to have made up their minds to keep the peace for the present. There is some speculation as to the future of the Virginian railway now that H. H. Rogers is dead, but it seems probable that a man of his business methods and habits of thought must have made some provision for carrying out his plans with this road.

In the anthracite trade there is nothing new. Accumulated stocks are being quietly worked off and many collieries are still running short time.

It is said that the Lackawanna directors are considering some plan for bringing their business into conformity with the recent decision on the commodities clause. It is not certain, however, whether a subsidiary company will be formed to operate the coal mines or whether some arrangement will be made for transferring the selling point of coal from tidewater and Lake Erie to the mines.

The cutting of rates at Springfield and other Massachusetts points on anthracite coal has, it is understood, been stopped, but the method or nature of the agreement does not seem to be generally known.

COAL TRAFFIC NOTES

Tonnage originating on Pennsylvania railroad lines east of Pittsburg and Erie, year to May 15, short tons:

	1908.	1909.	Changes.
Anthracite	2,058,960	2,011,893	D. 47,067
Bituminous	12,016,190	13,634,442	I. 1,618,252
Coke	2,969,443	3,689,546	I. 1,120,103
Total	16,044,593	18,735,881	I. 2,691,288

Increase for the week was 143,595 tons. Total increase this year to date was 12.6 per cent.

New York

ANTHRACITE

May 26—Trade continues quiet, with about the usual demand for consumption. There is a moderate putting in of stocks on the May discount which increases toward the end of the month when another 10c. will be taken off the discount. All sizes are in good supply.

Prices on domestic sizes are \$4.35 for lump and \$4.60 for egg, stove and chestnut, f.o.b. New York harbor. For steam sizes current quotations are \$3.10@3.25 for pea, \$2.35@2.50 for buckwheat, \$1.70 @2 for rice, \$1.25@1.50 for barley, f.o.b. New York harbor.

BITUMINOUS

The Seaboard bituminous trade, although still quiet, is showing some signs of improvement. A little more coal is being taken under contracts. The Far East is sending in a few orders. Business along the Sound remains steady, but not large. All-rail trade is about the same as it has been.

New York harbor continues to be rather a weak spot. Buyers are hunting for bargains, but not finding many. Prices are unchanged and there is little surplus coal, shippers still forwarding chiefly on orders.

Coastwise trade is a little better, but there are still plenty of boats and rates are unchanged. For large vessels from Philadelphia they are: To Boston, Salem and Portland, 55c.; Portsmouth, 70c.; Lynn, Newburyport and Bangor, 75c.; Providence, New Bedford and the Sound, 55c. per ton.

Birmingham

May 24—The coal trade in Alabama continues quiet. Very little coal is selling right now and the commercial producers are just as much down as the iron companies. But few companies in this State at present are operating their mines on full time. The coke demand is fairly good with prices holding up. Labor at the mines is complaining of the short work.

Chicago

May 24—The coal market shows increasing consumption of steam coals, with a lessening demand for lump to the advantage of fine coals. Screenings from Illinois and Indiana mines are the favorite fuel of many steam producers as summer comes on. Shipments of lump are too large just now.

mer comes on. Shipments of lump are too large just now.

Lump from Illinois and Indiana mines brings \$1.75@2.25; run-of-mine, \$1.65@1.75, and screenings \$1.35@1.65.

Eastern coals find a steady market, but smokeless run-of-mine shows something of its old tendency to have bunched shipments at the railroad terminals, causing sales at low prices to escape demurrage. Pocahontas and New River smokeless sells at \$3.20 for lump and \$2.95 for run-of-mine in general with run-of-mine occasionally bringing 10@20c. less. Hocking is still 25c. under the circular price of \$3.15 on most sales, and sometimes sells for 30 or 40c. less. Gas coals are in light, steady demand. Youghiogheny 3/4-in. bringing \$3.15.

Domestic coals find light sales, bituminous being dull and anthracite inactive generally.

Cleveland

May 25—Selling of coal has been slow; buyers seem to be holding back, in the hope of getting coal cheap from sales made to avoid demurrage. The market is kept down by heavy shipments, and slack especially is in over-supply. Lake trade is slow, owing to trouble about vessels. The strike affects the smaller boats most wanted in the coal trade, much more than it does the larger vessels. Middle district run-of-mine can be had at \$1 at mine. No. 8 run-of-mine 80@90c. at mine. Slack is purchasable at 50@60c. at mine.

Indianapolis

May 25—On the whole the coal trade for the past week has not been as satisfactory as expected. Shippers have been fairly good, but nothing has occurred to stiffen prices. The heaviest movement of Indiana coal is being directed over the Lake routes, although the Ohio river has moved a large tonnage. The factories and railroads are gradually increasing their buying. Orders for August and September delivery are expected to come in rapidly in the first two weeks of June. Retailers are holding off longer than usual, and the operators say the low prices have not appealed to them as expected. Most mines worked a little more than half time during the past week.

Pittsburg

May 25—No regular Lake shipments of coal will be made until after July 4. The movement thus far has been confined to

coal for the Canadian trade and some on railroad account. The Lake strike is not over, but the employers have the situation well in hand and believe they can man as many boats as required whenever they desire to do so. The regular market prices remain at \$1.10 to manufacturers and other large buyers and \$1.20 to retail dealers, for mine-run coal, but occasional sales are made at about \$1 a ton, as formerly. The chief activity is in slack, which has firmed up to 60¢ a cwt. in price.

Connellsville Coke—The coke merger is expected to be put through, but there is still some question, as some of the prices asked are very high, from \$3500 to \$5500 an acre. It is computed on the outside that at 8000 tons of coke realized per acre, to carry out the operation and exhaust the coal in 15 years it would require about 90¢ per ton of coke to be set aside to meet interest and refunding charges, computed at 6 per cent, and this is regarded as rather a heavy burden. Just what the options average on the whole, however, has not been ascertained.

The coke trade continues rather quiet, with prices unchanged at \$1.40¢ a ton for prompt furnace and \$1.80¢ a ton for contract furnace; \$1.80¢ a ton for prompt foundry and \$1.00¢ a ton for contract foundry coke, according to grade.

The *Courier* states the production in the Connellsville and lower Connellsville regions in the week ending May 15 at 252,485 tons, a gain of 8000 tons over the previous week, and reports shipments at 9179 cars; 3418 cars to the Pittsburgh district, 4073 to points west of Pittsburgh and 788 cars to points east of Connellsville. This is a gain of nearly 500 cars.

Coke Rates—The American Smelting and Refining Company has filed with the Interstate Commerce Commission a number of complaints of alleged overcharges on coke from the Connellsville region to Omaha and other western points.

Foreign Coal Trade

Austrian Coal—Coal production in Austria for the quarter ending March 31 was Coal, 3,550,016; brown coal, 6,341,830; total, 9,891,755 metric tons. Coke made was 453,631 tons. Briquets made were 94,367 tons, of which 48,877 tons were made from brown coal, or lignite.

British Coal Exports—Exports of fuel from Great Britain, with coal sent abroad for the use of steamships in foreign trade, four months ended April 30, long tons:

	1908.	1909.	Changes.
Coal	19,181,869	19,066,314	D. 115,555
Coke	302,221	359,624	D. 57,403
Briquets	180,552	470,257	D. 289,705
Total exports	19,664,642	19,900,295	D. 235,653
8 months export	6,241,076	6,085,543	D. 155,533
Total	20,225,071	20,376,138	D. 151,067

The *London Export* for this year was 3,049,302 tons, 16 1/2 per cent, 3,011,067 tons to Italy and 2,288,837 tons to Germany.

French Coal Trade—Exports and imports of fuel in France, quarter ended March 31, metric tons:

	Exports.	Imports.	Changes.
Coal	268,810	230,549	D. 38,261
Coke	35,010	38,042	L. 3,032
Briquets	24,750	45,105	L. 20,355
Imports:			
Coal	3,687,270	3,878,227	L. 190,957
Coke	403,810	491,062	L. 87,252
Briquets	213,340	252,700	L. 39,360

The chief imports are from Great Britain and Belgium. Exports include fuel furnished to steamships in foreign trade.

Welsh Coal Prices—Messrs. Hull, Blyth & Co., London and Cardiff, report current prices of coal as follows, on May 15: Best Welsh steam, \$3.00; seconds, \$3.78; thirds, \$3.54; dry coals, \$3.66; best Monmouthshire, \$3.48; seconds, \$3.36; best small steam, \$2.64; seconds, \$2.46. All per long ton, f.o.b. shipping point. This is a decline of 6 to 12¢ per ton.

Iron Trade Review

New York, May 26—A fair degree of activity continues in the iron and steel trades, although buying has fallen off somewhat from the recent high level. In part this is probably due to the fact that most manufacturers and immediate consumers have satisfied their needs for the present and have an abundance of material on hand; in part it is because the recent advances, though not great in themselves, have been sufficient to check some speculative business.

In finished material wire has had the greatest sale during the present month. This has resulted from the fact that the reduction in prices was held back much longer than in other branches, and when it was made there was consequently a rush to buy it. It is said that the American Steel and Wire Company took contracts during the first half of May for over 250,000 tons of wire and wire products. Structural steel sales for the same period are variously estimated from 175,000 up to 200,000 tons. The structural business is still coming in but the wire trade is pretty well over the rush.

Pig iron is in better demand than it has been. Both foundry and basic iron have sold well and from Pittsburgh a good demand for bessemer pig is reported. Eastern furnaces are so far encouraged that their ideas of price are stiffer, from 25¢ to 50¢ more is being asked in many cases for third-quarter delivery with an additional 25¢ for fourth quarter.

A feature of the market has been some large sales of heavy steel melting scrap. This would naturally go with the demand for basic pig.

Finished Iron and Steel Production—The American Iron and Steel Association reports the total make of rolled iron and steel in all forms in 1908 at 11,828,781 long tons, a decrease of 83,303 tons, or .04 per cent, from 1907. The pro-

duction of nails was 10,692,972 kegs of 100 lb. each, a decrease of 1,008,072 kegs, or 10 per cent. The output of tinplates in 1908 was 1,203,075,000 lb., an increase of 46,078,000 lb., or 4 1/2 per cent.

Baltimore

May 24—Exports for the week included 3,418,700 lb. steel billets to Liverpool. Imports included 1105 tons spiegeleisen and 1691 tons ferromanganese from Great Britain; 5400 tons iron ore from Cuba.

Birmingham

May 24—There is some pig iron being sold in the Birmingham district at present but the activity is not as pronounced as it was last month. Quotations are not as strong as they have been, some sales being made here now at \$11 for No. 2 foundry. Two or three companies in this district, however, are holding their product for \$11 so immediate delivery and not under \$12 for delivery during the last quarter of the year. There is to be a curtailment in the production in the next few days, mostly through the necessity for repairs at furnaces. The Tennessee company has no furnaces in blast at Ensley at all but four are going at Bessemer. The Woodward Iron Company has two out of three furnaces at Woodward in blast. The Sloss Sheffield company has five out of seven furnaces going. Williamson furnace needs repairs and will shut down this week. The Central Foundry Company furnace at Holt is reported as needing some repairs as well as that of the Woodstock Iron Company at Aniston. Inquiries are being received here but the business is far from being as active as last month. There is much hope expressed for a better condition in the future.

The foundries and machine shops could stand an improvement. The cast-iron pipe makers are busy and are running their plants on full time. A shipment of 31 cars of pipe by the Central Foundry Company at Bessemer, to Arizona, was made last week.

Chicago

May 24—The pig-iron market continues quiet, the market for iron and steel products is active. This condition would seem to point to increased sales of pig iron soon, but the selling element is not hopeful in this respect, though holding firmly to present prices. Small lots, for delivery in one to four months hence, are the order of the day. The average consumer of iron does not wish to go into the future to any great extent.

Southern iron sells for \$15.50 12 for delivery up to the end of the third quarter or \$15.85 to 16.35 Chicago. Northern holds at \$16.50 to 17, with both Northern and Southern doubtless selling on some contracts at 50¢ less than the minimum quo-

tation given. It is difficult to say at what price a large order could be placed, but it probably would not be much if at all below \$11 Birmingham for Southern, or \$16 for Northern.

Sales of iron and steel products are brisk, notably in railroad supplies and structural material. Coke is somewhat better for deliveries in the last half of the year, the best Connellsville bringing \$4.70, as heretofore.

Cleveland

March 25—Quite a number of sales of iron ore are reported. Ore is coming down from Lake Superior rather slowly. Notwithstanding the strike, there are boats enough in commission to handle all the shipments; about 200 are in operation.

Pig Iron—The market is quiet, but many small sales are being made of foundry, with some good lots of basic pig. Prices are about on a basis of \$15.25 for No. 2, Cleveland delivery.

Finished Material—Quite a number of small contracts for structural material and bars have been closed. Specifications on contracts are coming in more freely.

Philadelphia

May 26—The pig-iron market is stronger in tone, though prices have not advanced since last week. The chief activity is in basic, in which large contracts were placed, with more in negotiation. There is also more activity in several special brands which are selling at full asking prices. New inquiries are just to hand for pipe iron to cover the needs of pipe foundries. Forge iron is stronger in tone because of more inquiries but there have been no sales of consequence. The undertone of the entire market is stronger in view of enlarging demand from all quarters. No. 2X is quoted at \$10; gray forge, \$15, and basic, \$15.25, asking price.

Steel Billets—Further ordering of billets in good sized lots is to be noted. Prices are firmer but not higher.

Bars—Best refined bars, at 1.35c, are selling better than for a month. A number of consumers have covered early summer requirements this week with orders calling for delivery in June.

Sheets—The change this week consists in the placing of orders by a few large consumers who have been buying piecemeal for months.

Pipes and Tubes—While the tone of the market is said to be stronger it is not because of large or numerous orders in this territory. Merchant pipe has been practically advanced. Tubes are quiet.

Plates—The greater activity in shipyards, car shops and lesser industries is helping to strengthen the plate industry. A large amount of business has been sent to the mills of this State.

Structural Material The upward ten-

dency is more apparent every day. All the structural mills are getting good business. Prices are stronger, the advance being genuine. Heavy orders for bridge, railroad and general building work are in sight. Manufacturers are at last holding their heads up.

Scrap—Heavy steel and heavy cast scrap are beginning to move after a long dullness, but at prices which do not lead holders to want to unload. They look for an advance on heavy steel and railroad. Other grades are weak and dull. Yard men are looking up supplies but are cautious as to what they pay.

Pittsburg

May 25—The advanced prices for bars, plates, shapes and wire products made in the past two or three weeks have not stepped buying, which is still of fair volume, although not as heavy as it was at the minimum. It is recognized that the mills made the advances largely because they feared buyers were placing orders too freely, and were contracting for larger tonnages than they could conveniently dispose of.

The demand for wire products has been fairly heavy since the advance of \$2 per ton May 15, and some sellers are refusing to book as large tonnages as are offered. Present prices are \$1.70 on nails, 1.50c. on plain wire, 1.70c. on painted barb wire and 2c. on galvanized barb wire. The mills are running practically full.

The prospect is for a somewhat quieter steel market in the next two or three months, as the buying has been heavy and has probably exceeded the current rate of consumption.

Pig Iron—The market has scored a sharp advance, prices of all grades being 25 to 50c. higher than a week ago. Sales of between 20,000 and 30,000 tons of prompt bessemer have been made in the past week, the first lot being one of 10,000 tons, taken by a prominent steel interest at \$14.50, Valley. Other sales were of 4000- and 5000-ton lots, to ingot-mold foundries and steel works, and the price has advanced sharply to \$15, Valley, as a minimum for prompt or third quarter, some sellers asking \$15.25 and \$15.50. Basic pig has firmed up after the large sales in the past few weeks, as low as \$13.90, Valley, having been done, and the market is generally quoted at \$14.50, although this price might be shaded 15 or 25c. per ton. Sales of foundry iron have been made at all the way from \$14.50 to \$14.75, Valley, according to brand, and the market is quoted at this range, while forge is \$ 3.50 to 3.75, Valley. There has been a sharp advance in 50 per cent ferro-silicon, due to a temporary scarcity, and prompt material has sold at as high as \$75 per ton. Forward deliveries being at a higher, and sales of several carloads of ferro-silicon.

Steel—The market continues uneventful as to sales, as consumers are well covered by term contracts, on which deliveries continue to increase. Billets are firm at \$23, Pittsburg, and sheet-bars at \$25.50, delivered Pittsburg, Wheeling, Youngstown, etc.

Sheets—The market is unchanged, demand being fairly good, but prices shaded, on attractive business, about \$1 per ton on flat sheets and \$2 per ton on corrugated material. The regularly quoted market, on ordinary carloads, is 2.25c. on black and 3.25c. on galvanized, 28 gage.

Ferromanganese—The market is a trifle firmer, it being difficult to do \$40, Baltimore, even on attractive business, it being regularly quotable at about \$41, Baltimore, or \$42.95, Pittsburg.

Foreign Iron Trade

German Iron Production—The German Iron and Steel Union reports pig-iron production in April at 1,047,197 tons, being 25,919 tons less than in March. The average daily production increased, however, from 34,617 tons in March to 34,906 in April. For the four months ended April 30 the total make was, in metric tons:

	1908.	1909.	Changes.
Foundry iron	774,913	744,765	D. 30,148
Forge iron	230,384	232,838	D. 2,454
Steel pigs	351,671	369,652	I. 17,981
Bessemer pig	146,956	143,676	D. 3,281
Thomas (basic) pig	2,569,455	2,610,851	I. 41,396
Total	4,082,379	4,091,601	I. 9,222

Steel pig includes spiegeleisen, ferromanganese, ferro-silicon, and all similar alloys. The total output shows a slight gain for the first time this year.

Metal Markets

New York, May 26—The indications in most of the markets are of increasing demand, and in consequence there is a general upward tendency toward higher prices, though increases so far are moderate.

Gold, Silver and Platinum

UNITED STATES GOLD AND SILVER MOVEMENT

Metal.	Exports.	Imports.	Excess.
Gold:			
April 1909..	\$ 3,349,307	\$ 6,337,994	Exp. \$ 2,988,687

" 1908..	17,048,561	14,268,362	" 2,780,209

Exports from the port of New York, week ended May 22: Gold, \$6,589,739, to Paris, Berlin and Buenos Aires; silver, \$8,546,633, chiefly to London. Imports: Gold, \$739,552, from Australia and South America; silver, \$67,831, from Central America and Mexico.

Foreign trade of the United States, four months ended April 30, as valued by the

Bureau of Statistics, Department of Commerce and Labor:

Merchandise:	1908.	1909.
Exports.....	\$ 648,817,855	\$ 647,257,162
Imports.....	346,301,569	477,825,021
Excess, exports.....	\$ 302,516,286	\$ 69,932,141
Add excess of exports, silver.....		4,899,459
Add excess of exports, gold.....		28,809,244
Total export balance.....		\$ 108,640,844

The gold and silver movement will be found in the table at the head of this column.

The Treasury Department's estimate of money in the United States on May 1 is as follows:

	In Treasury.	In Circulation.
Gold coin (inc. bullion in Treasury).....	\$ 193,591,336	\$ 609,289,337
Gold certificates.....	42,089,580	604,609,289
Silver dollars.....	10,153,993	71,229,818
Silver certificates.....	5,965,203	476,581,797
Subsidiary silver.....	26,899,136	127,706,264
Treasury notes of \$100.....	5,481	4,350,519
U. S. notes.....	5,902,751	340,778,265
Nat. bank notes.....	25,263,392	662,144,83
Total.....	\$300,783,872	\$3,096,663,124

Population of the United States May 1, 1909, estimated at 88,687,000; circulation per capita, \$34.92. Government deposits in national banks, not included in Treasury stocks, \$59,381,047. Total circulation was \$10,369,023 more than on May 1 last year.

Gold—There was a less active demand for gold and prices on the open market in London declined a little, bars being quoted at 77s. 9d. per oz. with American coin 76s. 4d. per oz. In New York the outward movement of gold still continues, both to Paris and to South America.

Platinum—Trade is reported as improving and sales are larger. Prices show little change, current quotations being \$23@23.50 for refined platinum, \$25.50 for hard metal, and \$18.50@20.50 per oz. for scrap.

Our St. Petersburg correspondent writes under date of May 13: The government conference at St. Petersburg has not satisfied the smaller producers. It recommends that the export of crude platinum from Russia be prohibited, all refining to be done in the country. The proposition for a platinum trust has failed. The circulation of crude metal will be limited.

Quotations are unchanged. At Ekaterinburg the price is 4.50@5 rubles per zolotnik for crude metal, 83 per cent.; at St. Petersburg, 18,000@19,000 rubles per pood. These prices are equivalent to \$16.62 and \$18.13 per oz., average.

26	13½@13¾	12¾@13	59½	29¼	4.30@4.32½	4.25@4.30	5.00@5.05

London quotations are per long ton (2240 lb.) standard copper. The New York quotations for electrolytic copper are for cakes, ingots and wirebars, and represent the bulk of the transactions made with consumers, basis, New York, cash. The price of cathodes is usually 0.125¢ below that of electrolytic. The quotations for lead represent wholesale transactions in the open market. The quotations on spelter are for ordinary Western brands; special brands command a premium.

Copper—A large business has been done during the past week, for home trade as well as for export. The consumption is steadily improving, and if looks as if the deliveries for May would exceed the production, thus reducing the stock. There has been a good demand, not only for early delivery, but also for shipment over the remainder of the year, but producers have been unwilling to sell ahead at present figures. Prices have advanced, the closing quotations being 13½@13¾¢ for Lake copper; 13@13¼¢ for electrolytic in ingots, cakes and wirebars; 12¾@13¢ for casting copper. The average for casting copper has been 12¾@13 cents.

On Thursday and Friday of last week the standard market was firm at £50 7s. 6d. for spot, and £60 for three months. This week it became very active. Large orders came to hand from all sides and prices quickly advanced, closing at £61 2s. 6d. for spot and £61 16s. 3d. for three months, an advance of almost £2 since the close of last Wednesday.

Copper sheets have been advanced 1½¢ to 17¢ base for large lots. Full extras are charged, and higher prices for smaller quantities. Copper wire is 14½¢ base,

carload lots at mill. Business has been good.

For refined and manufactured sorts we quote: English tough, £64; best selected, £63@64; strong sheets, £75@77.

Tin—There has been a better tone in the London market, where the selling pressure, which was noticeable for some time past, seems to have been removed. Quotations have, however, not shown much change, but close firm at £132 12s. 6d. for spot and £133 12s. 6d. for three months.

Sellers in the domestic market have also been a good deal firmer, and especially spot material seems again to be concentrated in a few strong hands. The market closes steady at about 29½ cents.

Lead—There is a good demand for this article, particularly in the West, where prices have advanced, the close at St. Louis being quoted at 4.25@4.30, while at New York it remains unchanged at 4.30@4.32½ cents.

The John Wahl Commission Company telegraphs us from St. Louis, under date of May 26, that lead is strong and fairly active. Missouri brands are salable at 4.27½¢ for both prompt and June delivery.

The London market has been quiet and somewhat lower, Spanish lead closing at £13 3s. 9d. and English lead at £13 7s. 6d.

Spelter—The galvanizing trade is constantly improving, and in consequence the consumption of spelter is steadily increasing. There has been a good demand during the week; prices are still advancing, St. Louis being quoted at 5.05@5.10¢, and New York 5.20@5.25¢. Sales for future delivery have been made at as high as 5.12½¢, St. Louis.

Quotations for spelter in New York May 20 and 21 were 5.15@5.20¢; May 22 they were 5.17½@5.22½¢; May 24-26, inclusive, 5.20@5.25 cents.

The John Wahl Commission Company telegraphs us from St. Louis, under date of May 26, that spelter continues to advance. The latest sales are on a basis of 5.12½ cents.

The market in London is firm, closing quotations being unchanged at £22 for good ordinaries, £22 5s. for specials.

Base price of sheet zinc is 63½¢ per lb., f.o.b. La Salie-Peru, less 8 per cent. discount.

Other Metals

Antimony—The market has been dull, and prices in the absence of sales are rather nominal at 83½¢ for Cookson's; 77½¢ for U. S., and 74½@75¢ for outside brands.

Aluminum—Business is increasing a little. Prices are unchanged at 22@24¢ base for No. 1 ingots; 31@32¢ base for wire and 33@34¢ base for sheets.

Quicksilver—Business is rather better, but prices are unchanged. New York quotation is \$44.50 per flask of 75 lb. San Francisco, \$44 for domestic and \$42 for export orders. London quotation is £8 7s. 6d. per flask, with £8 2s. 6d. quoted by jobbers.

Nickel—Large lots, contract business, 40¢50c. per lb. Retail, spot, from 50c. for 2000-lb. lots up to 55c. for 500-lb. lots. The price for electrolytic is 5c. higher.

Cadmium—Current quotation 75c. per lb., in 100-lb. lots, at Cleveland, Ohio.

Magnesium—Quotations for this metal are \$1.25 per lb., New York, in 100-lb. lots; for 5-lb. lots, \$1.40 per pound.

British Metal Imports and Exports

Imports and exports of metals in Great Britain, four months ended April 30, figures in long tons, except quicksilver, which is in pounds:

Metals:	Imports.	Exports.	Excess.
Copper, long tons	39,126	23,802	Imp. 15,324
Copper, 1908...	50,704	21,394	Imp. 29,310
Tin, long tons	13,019	13,389	Exp. 371
Tin, 1908...	16,200	13,430	Imp. 2,770
Lead, short tons	73,461	14,712	Imp. 58,749
Lead, 1908...	81,241	18,322	Imp. 62,919
Spelter, sh. tons	36,492	2,982	Imp. 34,410
Spelter, 1908...	35,137	2,438	Imp. 32,699
Quicksilver, lb.	1,282,063	356,226	Imp. 925,837
Quicksilver, '08	1,691,733	633,256	Imp. 1,058,478
